# CONCEPTUAL REFERENCE GUIDE

This outline is intended to provide the reader with a quick reference to the conceptual basis underlying financial accounting and reporting.

## I. EXTERNAL USERS AND USES OF FINANCIAL ACCOUNTING INFORMATION

- A. **External Users:** Actual or potential investors (stockholders and bondholders), creditors (e.g., suppliers and lending institutions), and other users (e.g., employees, stock exchanges).
- B. **Primary Decisions:** To (1) buy, (2) hold, or (3) sell a particular security; or to (1) extend credit, (2) maintain a credit relationship, or (3) not extend credit.

## II. OBJECTIVES OF FINANCIAL REPORTING

- A. **General Objective:** Provide information useful in making rational investment, credit, and similar decisions.
- B. **External User Objective:** Provide information useful in assessing amounts, timing, and uncertainty of prospective cash receipts from dividends and interest, and the proceeds from the sale, redemption, or maturity of securities and loans.
- C. **Company Objective:** Provide information useful in assessing amounts, timing, and uncertainty of prospective net cash flows to the related company.
- D. **Specific Objectives:** Provide information about a company's: (1) economic resources, obligations, and owners' equity; (2) comprehensive income and its components; and (3) cash flows.
- E. **Other Objectives:** Provide (1) information about how the management of a company has discharged its stewardship responsibility to owners and (2) explanations and interpretations by management to help external users understand the financial information presented.

## III. TYPES OF USEFUL ACCOUNTING INFORMATION

- A. **Return on Investment:** Amount of return on capital that may be distributed to investors or reinvested. Measure of overall company performance.
- B. **Risk:** Uncertainty or unpredictability of the future results.
- C. **Financial Flexibility:** Ability to adapt to change.
- D. **Liquidity:** How quickly assets can be converted into cash to pay bills.
- E. **Operating Capability:** Ability to maintain a given physical level of operations.

## IV. QUALITATIVE CHARACTERISTICS OF USEFUL ACCOUNTING INFORMATION

- A. **Understandability:** Information should be understandable to external users who have a reasonable knowledge of business and economic activities.
- B. **Decision Usefulness:** Information should be useful in external users' decision making. Overall qualitative characteristic.
- C. **Relevance:** Capacity to make a difference in a decision. Includes (1) *Predictive Value*: Enables more accurate forecast of outcome of past or present events, (2) *Feedback Value*: Enables decision makers to confirm or correct prior expectations, and (3) *Timeliness*: Availability of information before it loses its capacity to influence decisions.
- D. **Reliability:** Reasonably free from error or bias, and faithfully represents what it is intended to represent. Includes (1) *Verifiability* (Objectivity): Ability of measurers (accountants) to agree that measurement results can be duplicated, (2) *Representational Faithfulness* (Validity): Degree of correspondence between reported measurements or descriptions and economic resources, obligations, and transactions and events causing changes in these items, and (3) *Neutrality*: Absence of bias and completeness of information.

- E. **Comparability:** Enables users to identify and explain similarities and differences between two (or more) items of information. Includes *Consistency*: Conformity of information from period to period.
- F. **Constraints:** Limits to help identify useful accounting information. Includes (1) *Benefits Greater Than Costs*: Benefits obtained by users of information must be greater than costs of providing information, and (2) *Materiality*: Monetary impact of the information must be large enough to make a difference in decision making (*quantitative constraint*).

## V. ACCOUNTING ASSUMPTIONS AND PRINCIPLES

- A. **Entity:** Information is recorded and reported about each separate economic entity (company).
- B. **Continuity (Going Concern):** Company is assumed to continue future operations, unless substantial contrary evidence exists.
- C. **Period of Time:** Information is reported in a company's financial statements at least on an annual basis.
- D. **Monetary Unit:** National currency of company is used as stable unit of measure in preparing financial reports.
- E. **Historical Cost:** Generally, exchange price is retained in the accounting records as the value of an item until it is consumed, sold, or liquidated and removed from records.
- F. **Recognition:** Process of formally recording and reporting an item in a company's financial statements.
- G. **Realization:** Process of converting noncash resources into cash or rights to cash.
- H. **Accrual Accounting:** Process (matching) of relating financial effects of transactions, events, and circumstances having cash consequences to the period in which they occur rather than when the cash receipt or payment occurs.
- I. **Prudence (Conservatism):** Process of ensuring, to extent possible, that uncertainties and risks related to a company are reflected in its accounting information.

## VI. GENERALLY ACCEPTED ACCOUNTING PRINCIPLES (GAAP)

- A. **Definition:** Guidelines, procedures, and practices that a company is required to use in recording and reporting the accounting information in its audited financial statements.
- B. **Sources:** (in descending order of importance)
  1. **Category A:** FASB *Statements of Financial Accounting Standards and Interpretations*, FASB *Staff Positions*, FASB *Statement 133 Implementation Issues*, APB *Opinions*, and CAP (AICPA) *Accounting Research Bulletins* (as well as SEC releases such as *Regulation S-X*, *Financial Reporting Releases*, and *Staff Accounting Bulletins* for companies that file with the SEC).
  2. **Category B:** FASB *Technical Bulletins* and AICPA *Industry Audit and Accounting Guides*, and AICPA *Statements of Position*, (if cleared by the FASB).
  3. **Category C:** FASB Emerging Issues Task Force *Consensus Positions* and AICPA *Practice Bulletins* (if cleared by the FASB).
  4. **Category D:** FASB *Q's and A's* (Implementation Guides), AICPA *Accounting Interpretations*, and practices that are widely recognized and prevalent either generally or in the industry (e.g., AICPA *Accounting Trends and Techniques*).
  5. When none of the pronouncements in Categories A through D apply, then the company may consider other accounting literature such as FASB *Statements of Concepts*, AICPA *Issues Papers*, IASB *International Financial Reporting Standards*, AICPA *Technical Practice Aids*, and accounting textbooks, handbooks, and articles for GAAP guidance.

### Loren A. Nikolai

Loren Nikolai is the Ernst & Young Professor and Director of the Masters Programs in the School of Accountancy at the University of Missouri—Columbia (MU). He received his B.A. and M.B.A. from St. Cloud State University and his Ph.D. from the University of Minnesota. Professor Nikolai has taught at the University of Wisconsin at Plattsville and at the University of North Carolina at Chapel Hill. Professor Nikolai has received numerous teaching awards. Most recently, he was the recipient of the MU Student-Athlete Advisory Council 2004 Most Inspiring Professor Award. Also, he has been awarded University of Missouri System 1999 Presidential Award for Outstanding Teaching, the MU Alumni Association 1996 Faculty Award, the MU College of Business 1994 Accounting Professor of the Year Award, the Missouri Society of CPAs 1993 Outstanding Accounting Educator of the Year Award, the MU 1992 Kemper Fellowship for Teaching Excellence, the St. Cloud State University 1990 Distinguished Alumni Award, and the Federation of Schools of Accountancy 1989 Faculty Award of Merit. He holds a CPA certificate in the state of Missouri and previously worked for the 3M Company. Professor Nikolai is the lead author of *Intermediate Accounting*, and has also been an author on four other accounting textbooks.

Professor Nikolai has published numerous articles in *The Accounting Review*, *Journal of Accounting Research*, *The Accounting Educator's Journal*, *Journal of Accounting Education*, *The CPA Journal*, *Management Accounting*, *Policy Analysis*, *Academy of Management Journal*, *Journal of Business Research*, and other professional journals. He was also lead author of a monograph published by the National Association of Accountants. Professor Nikolai has served as an ad hoc reviewer for *The Accounting Review* and *Issues in Accounting Education*. He has made numerous presentations around the country on curricular and pedagogical issues in accounting education, and was advisor for Beta Alpha Psi for twenty years.

Professor Nikolai is a member of the American Accounting Association, the American Institute of Certified Public Accountants (AICPA), and the Missouri Society of CPAs (MSCPA). He has chaired and served on numerous committees of the AICPA, the MSCPA, the Federation of Schools of Accountancy, and the AAA. Professor Nikolai is married and has two adult children and three grandsons. His family has two cats, and he is an avid basketball player, golfer, and weight lifter.

### John D. Bazley

John Bazley is the John J. Gilbert Professor in the School of Accountancy of the Daniels College of Business at the University of Denver, where he has received numerous teaching awards, including the University's Distinguished Teaching Award. Professor Bazley earned a B.A. from the University of Bristol in England and an M.S. and Ph.D. from the University of Minnesota. He has taught at the University of North Carolina at Chapel Hill and holds a CPA certificate in the state of Colorado. He has taught national professional development classes for a major CPA firm and was consultant for another CPA firm. Professor Bazley is the coauthor of *Intermediate Accounting*, and has also been an author on three other accounting texts.

Professor Bazley has published articles in professional journals, including *The Accounting Review*, *Management Accounting*, *Accounting Horizons*, *Practical Accountant*, *Academy of Management Journal*, *The Journal of Managerial Issues*, and *The International Journal of Accounting*, and was a member of the Editorial Boards of *Issues in Accounting Education* and the *Journal of Managerial Issues*. He has served on numerous committees of The Federation of Schools of Accountancy (including chair of the Student Lyceum Committee), the American Accounting Association, and the Colorado Society of CPAs (including the Continuing Professional Education Board). He is also a coauthor of a monograph on environmental accounting published by the National Association of

Accountants. Professor Bazley is a member of the American Institute of Certified Public Accountants, the Colorado Society of CPAs, and the American Accounting Association. He has recently appeared as an expert witness for the Securities and Exchange Commission and as a consultant for a defendant in a securities fraud case. Professor Bazley is married and has two children, who especially enjoy their three cats, one dog, and eleven reptiles. He enjoys skiing, playing golf, car racing, and listening to jazz.

### Jefferson P. Jones

Jeff Jones is an Associate Professor of Accounting in the School of Accountancy at Auburn University. He received his B.S. and Master of Accountancy from Auburn University and his Ph.D. from Florida State University. Professor Jones has received numerous teaching awards. He is the recipient of the 2004 Auburn University College of Business McCartney Teaching Award, the 2005, 2003, and 2001 Beta Alpha Psi Outstanding Teaching Award, and the 2000 Auburn University School of Accountancy Teaching Award. He has also been recognized in *Who's Who Among America's Teachers* (2002 and 2004). Professor Jones holds a CPA certificate in the state of Alabama and previously worked for Deloitte & Touche. Professor Jones is a coauthor of *Intermediate Accounting*.

Professor Jones has published articles in professional journals, including *Advances in Accounting*, *Review of Quantitative Finance and Accounting*, *Issues in Accounting Education*, *International Journal of Forecasting*, *The CPA Journal*, *Managerial Finance*, *Journal of Accounting and Finance Research*, and *The Journal of Corporate Accounting and Finance*. Professor Jones has made numerous presentations around the country on research and pedagogical issues. He is a member of the American Accounting Association, the American Institute of Certified Public Accountants (AICPA), and the Alabama Society of CPAs (ASCPA). Professor Jones is married, has two children, and enjoys playing golf.

Known for its balanced coverage of both concepts and procedures, *Intermediate Accounting* gives students an unparalleled look at financial accounting information and its increasingly varied uses in the world today. In addition to the thorough coverage of GAAP expected of a book of its caliber, the timely tenth edition illustrates the practices professional accountants execute daily, as well as the concepts behind those practices. Through this approach, this textbook equips students with the tools needed to critically assess evolving, accounting practices needed to meet the demands of a dynamic, professional world.

With three decades of experience, we continue to connect with the contemporary student with improved readability, while introducing them to the language of the profession. As before, compelling real world financial statements and research cases help students see the implication of the material at hand and learn to apply it in a real business context. Notably, Appendix A contains 2004 financial statements and supplemental data of The Coca-Cola Company for use throughout the book, but the tenth edition brings even more to the table.

With the new perspective brought by co-author Jeff Jones and the move to a lively, four-color design, *Intermediate Accounting* effectively imparts essential knowledge and skills through a student-friendly, easy to reference, and pedagogically sound presentation. Coupling that with the comprehensive coverage, professional language, and real world applications that have been the hallmarks of the text for many years, the tenth edition provides the perfect link between the academic and professional world. We believe this book simultaneously provides students with the vibrant pedagogy they need to understand the material and the technical complexity they need to succeed as professionals.

*Intermediate Accounting*, Tenth Edition consists of five parts containing 23 chapters, as follows:

- Part 1 Financial Reporting: Concepts, Financial Statements, and Related Disclosures (Chapters 1–6, and the Time Value of Money Module)
- Part 2 Financial Reporting: Asset Measurement and Income Determination (Chapters 7–12)
- Part 3 Financial Reporting: Valuation of Liabilities and Investments (Chapters 13–15)
- Part 4 Financial Reporting: Stockholders' Equity (Chapters 16–17)
- Part 5 Financial Reporting: Special Topics (Chapters 18–23)

## TEACH THE LOGIC AND THE PRACTICE

### CLEAR OBJECTIVES

Objectives at the beginning of each chapter prepare students for what they will be studying. We list each objective in the margin beside the topical coverage to reinforce students' learning.

### CONCEPTUAL-ANALYTICAL-REAL REPORT FRAMEWORK (C-A-R)

Over the years, a major strength of *Intermediate Accounting* has been its comprehensive coverage of GAAP, but its unique hallmark is the authors' conceptual and analytical discussions related to those procedures. Through the C-A-R framework, the textbook draws out these important explanations and presents the underlying thought processes of financial analysis. Coupled with the interactive new and improved Real Reports, the C-A-R

4 Define the elements of a balance sheet.

*"This should help students to differentiate conceptual-analytical-applied topics while still showing how they are integrated. [ . . . ]*

*Ideally, text, classroom, and tests will all encourage and facilitate integration, and by extension, critical thinking."*

Mark Comstock-  
Missouri Southern  
State University

*"Yes, I think that this a very effective way to bring out this important information. Students often get confused between conceptual alternatives, alternative computational techniques and what is actually done in the corporate world. This is the first time I have seen a serious attempt to distinguish among these areas in a meaningful way for the students."*

Herbert Hunt-  
CSU Long Beach

*"I think this is an excellent idea. I am positive it will achieve what you want – a tie between GAAP and practice. The information is explained very clearly and the classification of conceptual, analytical, and real world will be very helpful to the students."*

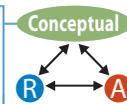

Mary Loyland-  
University of  
North Dakota

progression bolsters students' accounting savvy as they come to understand the logic and the practice of accounting.

## Conceptual

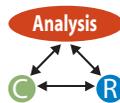

Supported by the FASB conceptual framework introduced in Chapter 2, we relate the discussion of specific topics to the objectives of financial reporting, qualitative characteristics of accounting information, conceptual reporting guidelines, and to the concepts of liquidity, financial flexibility, risk, operating capability, and return on investment. With the conceptual discussions, students begin to understand the environment that gave rise to a specific procedure. Once that logic is place, they can begin the practice of accounting with a firm understanding of the environment in which they operate.

statements. Recall from Chapter 2 that **recognition is the process of formally recording and reporting an element in the financial statements**. It includes depiction of an element in both words and numbers, with the amount included in the totals. Generally, the most useful (i.e., the best combination of relevance and reliability) information about assets, liabilities, and equity should be recognized and reported in the main body of the balance sheet. There are four basic recognition criteria. To be recognized, an item (and information about it) must meet the definition of an element, and be measurable, relevant, and reliable.<sup>5</sup> Thus, to meet the objectives of a company's balance sheet—to provide

## Analysis

To help bridge the gap between the conceptual and procedural, we indicate essential analytical coverage that illustrates the significance and application of certain key company characteristics and related ratio calculations to financial analysis. This material illuminates the critical thinking process, so that students can further understand how the logic of the conceptual framework translates to everyday accounting procedure and business practice. By effectively grounding this translation in specific business activities, this coverage further prepares students to intelligently apply this material on their own.

Offsetting Allowance for Doubtful Accounts against Accounts Receivable informs financial statement users of the net realizable value (the amount of cash expected to be collected) of the company's receivables.<sup>12</sup>

It is possible to base the estimate of bad debt expense on historical relationships

## Reporting

In addition to a thorough understanding of business transactions and the environment of financial analysis, students need to be aware of issues that arise during financial reporting. Using concrete examples, we describe how items are reported in financial statements, which instills students with the knowledge and understanding they need to efficiently and effectively report their findings according to GAAP. A key aspect of the report coverage are the Real Reports. The unique Real Report feature gives students the opportunity to test their reporting mettle with real company data.

An audit report is *not* part of the financial statements because it is a report by the independent auditor. Nonetheless, it is considered an important item of information because external users place reliance on the report as to the fairness of the financial statements. The "standard" form of an auditor's report on *comparative* financial statements (often referred to as an *unqualified* report) is shown in Exhibit 6-1.<sup>3</sup> (The audit report of

## Real Reports

When it's time to put it all together, this feature encourages students to test their understanding by providing excerpts from real company reports and challenging students to answer several questions about the information they see. As part of the Reporting material, students learn by doing, and stretch their understanding of each topic to its limit.

With the answers provided in the end of the chapter material, these self-contained features provide students a chance to test themselves as they read.

### Real Report 7-1 Cash and Cash Equivalents

EASTMAN KODAK COMPANY AND SUBSIDIARY COMPANIES  
 CONSOLIDATED STATEMENT OF FINANCIAL POSITION (in part)

(in millions, except share and per share data)	At December 31	
	2004	2003
<b>ASSETS</b>		
Current Assets		
Cash and cash equivalents	\$1,255	\$1,250

NOTES TO FINANCIAL STATEMENTS  
**NOTE 1: Significant Accounting Policies (in part)**  
**Cash Equivalents** All highly liquid investments with a remaining maturity of three months or less at date of purchase are considered to be cash equivalents.

#### Questions:

1. Why does Eastman Kodak combine cash and cash equivalents into one amount on the balance sheet?

### Clarifying Computational Steps

Because complex computations can be hard for students to master, we reduce many computational procedures to a series of steps outlined in list format. For instance, Example 9-13 includes a series of steps for dollar-value LIFO calculations. Similar lists of steps for the gross profit inventory method, retail inventory method, and dollar-value LIFO retail method appear in Chapter 9. We include other computational steps where appropriate throughout the rest of the book.

### Straightforward Design Distinguishes Important Material

- Key terms, definitions, and official statements are in boldface.
- Particularly important information is in italics.
- All real companies are in boldface.
- Exhibits of illustrations of journal entries, supporting schedules, and financial statements clarify concepts or procedures.
- All journal entries are now in blue.

<b>Interest Expense</b>	<b>200</b>	
Discount on Notes Payable		<b>200</b>
<b>Notes Payable</b>	<b>10,000</b>	
Cash		<b>10,000</b>

- Excerpts from real financial statements have a special background:

**ConAgra Foods**  
*NOTE 1: Summary of Significant Accounting Policies (in part):*  
**Inventories** Grain, flour, and major feed ingredient inventories are hedged to the extent practicable and are principally stated at market, including adjustment to market of open contracts for purchases and sales.

*NOTE 9: Senior Long-Term Debt, Subordinated Debt and Loan Agreements*  
 Interest expense incurred to finance hedged inventories has been charged to cost of goods sold.

*"I really like the design of these and do think they provide a valuable piece of the chapter coverage. Like I mentioned earlier, a move from the technical to the practical is very welcome and needed in the intermediate sequence."*  
 Alee Phillips-  
 University of Kansas

*"Yes, I do like these examples and questions and particularly that the answers are in the end-of-chapter materials. This is a feature I would definitely like."*  
 Vern Richardson-  
 University of Arkansas

*"I like these kind of problems because they use real-world companies and I strongly believe students pay more attention to examples dealing with the IBMs of the world versus the hypothetical ACMEs. Also, these kind of problems make the students critically think through the accounting and reporting issue as well as an application of the issue. They'll like the design of these kind of problems, and I think they are extremely valuable."*  
 Rick Turpin-University of Tennessee-  
 Chattanooga

*"I really do think that these will be extremely helpful. The torn edge style of the box gives a real world feel to the information. I do like the examples that are used, the text is fine."*  
 Rizvana Zameeruddin-  
 University of Wisconsin-Parkside

## Enhanced Design for Examples

In *Intermediate Accounting*, examples are clearly identified for easy reference. For in-text examples, the example text heading will be in red, and when the example ends, there will be a red bullet. Major, numbered examples, will also be in red, but will be in a box. This useful design ensures that students will know where they are in the material at all times.

EXAMPLE 7-3 Accounting for Short-Term Notes Receivable						
	Interest-Bearing			Non-interest-Bearing		
To record receipt of note on October 1, 2007	Notes Receivable	5,000		Notes Receivable	5,100	
	Sales		5,000	Interest Revenue		100
				Sales		5,000
To record receipt of maturity value on December 1, 2007	Cash	5,100		Cash	5,100	
	Notes Receivable		5,000	Notes Receivable		5,100
	Interest Revenue*		100			

\*\$5,000 × 0.12 × 60/360

## UNDERSTAND THE LOGIC AND THE PRACTICE

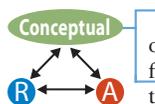

Like no other book on the market, *Intermediate Accounting*, 10e moves beyond teaching just technical skills and makes even the most complex procedures accessible to students through an understanding of the conceptual framework.

### Introduction of the FASB Conceptual Framework

Students are introduced to the “conceptual framework” in Chapter 2. This discussion involves an identification and explanation of the objectives of financial reporting (Exhibit 2-3) and the qualitative characteristics of useful accounting information (Exhibit 2-5). The chapter also includes an explanation of the interrelationship between financial reports, types of useful information, and external decision making (Exhibit 2-4), as well as a framework of financial accounting theory and practice (Exhibit 2-6).

### Integrated Conceptual Discussion

Supported by the FASB conceptual framework introduced in Chapter 2, we relate the discussion of specific topics to the objectives of financial reporting, qualitative characteristics of accounting information, and conceptual reporting guidelines, and to the concepts of liquidity, financial flexibility, risk, operating capability, and return on investment. Where there are significant conceptual issues concerning an accounting principle, there is an objective discussion of the alternative views. Note that this coverage is indicated through the design.

Information on cash management is important in financial accounting because one objective of financial reporting is to communicate how well the managers of a company have fulfilled their stewardship responsibility to stockholders for the use of the company assets. In this regard, cash management includes planning and control aspects. **Cash planning** systems

This integrated discussion of accounting theory is not at the expense of sound, procedural pedagogy, and we emphasize a balanced presentation of concepts and practice. For each topic, students will find a clear and concise discussion of the related generally accepted accounting principles. We enhance the discussion with a thorough explanation and illustration of the corresponding practices and procedures.

*“This is good, especially now! I spend a lot of time on the conceptual framework. It is impossible to memorize all rules...Students need to understand these three things [Conceptual, Analytical, Real World] are different. Three aspects, perspectives, not hierarchy. This is a plus.”*

Jane Bozewicz -  
Babson University

## IASB Conceptual Framework

Because of the continuing globalization of companies, we briefly discuss the International Accounting Standards Board's Framework for the Preparation and Presentation of Financial Statements. This Framework provides the conceptual underpinning for the international accounting standards that we discuss in later chapters.

## Conceptual Reference Guide

This guide provides a quick review of the concepts underlying financial accounting and is located inside the front and back covers of the book.

## REINFORCE THE LOGIC AND THE PRACTICE

New and improved summary features help students identify key concepts and link them to a more complete understanding of the accounting process.

## NEW! Secure Your Knowledge Summary

With all of the material presented to a student in an *Intermediate Accounting* text, these bulleted summaries help students identify key points, which helps them test their knowledge and review for tests.

### SECURE YOUR KNOWLEDGE 5-2

- Income from continuing operations is a summary of the revenues, expenses (e.g., cost of goods sold, operating expenses, income tax expense), and other items that are expected to continue into the future.
- Income from continuing operations may be reported in a single-step format that classifies all items into either revenues or expenses, or it may be reported in a more useful multi-step format that contains additional classifications of the income statement elements.
- Discontinued operations (a component of a company's operations that has been, or will be, eliminated from ongoing operations) are reported net-of-tax directly after income from continuing operations.
- Extraordinary items, material gains or losses that are unusual in nature and infrequent in occurrence, are reported net-of-tax below the results of discontinued operations.
- Companies are required to report earnings per share amounts relating to income from continuing operations and net income on their income statements.
- The disclosure of additional information in the footnotes to the financial statements or in supplemental schedules is encouraged to overcome limitations of the income statement and provide external users with information useful for evaluating company performance.

## Comprehensive Chapter Summaries

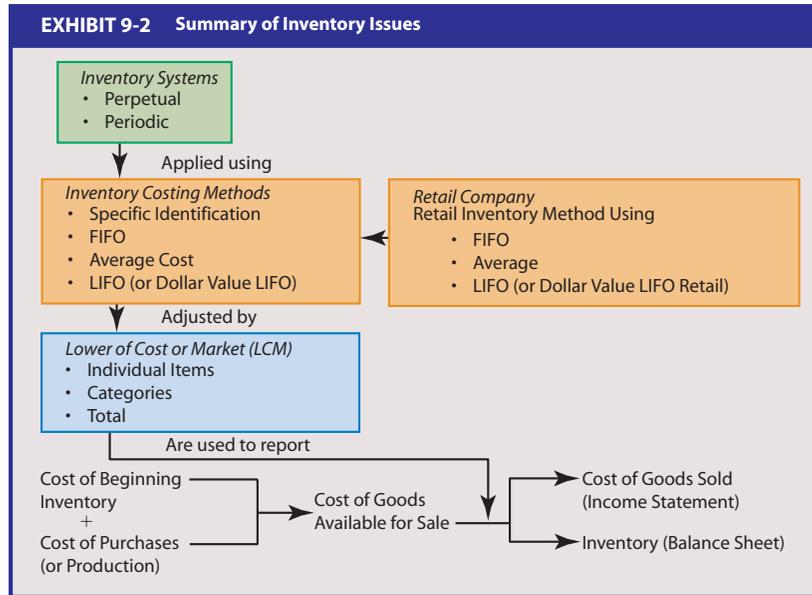

Each chapter ends with a summary of the key points for each major topic. Tied directly to the Objectives from the beginning of the chapter, these summaries provide students with a quick review of the important topical issues.

*"I feel that this feature is extremely helpful and that students will use it to their advantage when reading the text the first time and then when reviewing for exams. What's nice about them is they are strategically located so students can test their knowledge before going on to the next topic, thus allowing them to take relatively small "bites" of knowledge as they progress through the chapter."*  
Herbert Hunt-  
CSU Long Beach

*"I think that the "Secure Your Knowledge" is excellent. They provide a valuable learning tool and should be used by just about all students."*  
Mary Loyland-  
University of North  
Dakota

## Helpful Summary Exhibits

Summary exhibits throughout the text help students pull together and understand what they have learned so far. For instance, Exhibit 5-3 summarizes corporate earnings and cash flow topics, Exhibit 21-2 summarizes the criteria and classifications for leases, and Exhibit 23-1 summarizes the impacts on financial statements of the methods used for accounting changes and errors.

## APPLY THE LOGIC AND THE PRACTICE

*Intermediate Accounting* is the meeting point of many aspects of the discipline. Most notably, it is the link between Financial Principles and the professional world, but also, it links out to the other areas of the field such as ethical and global issues.

### NEW! Chapter Openers

These entertaining and informative vignettes briefly introduce concepts in the upcoming chapter through real aspects of the professional, accounting world. In addition, these openers include references to industry journals and newspapers for further reading. All of these sources are included in the Business and Company Resource Center (BCRC), which is automatically included with the new text.

*"I really like the way questions are embedded in the vignettes. This will help drive the student's discussion."*  
Abdul Qastin-Lakeland College

### FOR FURTHER INVESTIGATION

For a discussion of ARC or Check 21, consult the Business & Company Resource Center (BCRC):

- Tear Out a Check, Then Watch it Vanish. Jeffrey Selingo, *The New York Times*, 0362-4331, October 9, 2003, pG6 col. 04.
- Why Check 21 Could Erase ARC's Gains. Will Wade, *American Banker*, 0002-7561, November 5, 2003, v168, i213, p1.

### NEW! Link to Ethical Dilemmas

The ethical link between accounting practices and applications in the business world grows in importance daily. To help students develop their ethical compass, this feature

puts the student in the role of the decision maker faced with an ethical dilemma. In addition, we provide a complete section on this topic in Chapter 1, as well as end-of-chapter cases sprinkled throughout the text.

### LINK TO ETHICAL DILEMMA

As the controller for a struggling manufacturing company, you are in the process of closing the books for the year and notice that the company is going to be in technical violation of its debt covenants. Such a violation could result in bankruptcy, which would result in the loss of hundreds of jobs, including your own. You quickly analyze the financial statements and realize that by changing a few estimates involving accounts receivable, warranties, and pensions, the company will be able to avoid a violation of its debt covenants. While you don't believe the revised estimates would best represent the economic reality of your company's financial position, you also don't believe the estimates are unreasonably aggressive. Do you revise the estimates?

*"The design is great! It definitely effectively separates the content and importantly draws attention to the issues. My feeling is that this is a good thing to do rather than simply burying the discussion points in the paragraphs with everything else. This is especially important in this course because there is so much material and it's often difficult for the students to think of every angle/ consideration that might be important."*  
Herbert Hunt-  
CSU Long Beach

### Improved! Link to International Differences

Though *Intermediate Accounting* tackles the sizable topic of domestic GAAP, this feature enlightens students about the link between the FASB and International Accounting Standards Board (IASB), and encourages them to be mindful of possible global differences.

For the previous edition, we modified the discussion of international accounting standards in many chapters to expand the discussion and bring it up to date, and we continue that project in this edition.

### LINK TO INTERNATIONAL DIFFERENCES

International accounting standards allow a company to record some internally generated intangibles as assets. Specifically, the company must classify activities leading to the generation of an intangible asset into a research and a development phase. Research costs are expensed but development costs may be capitalized if the company can demonstrate that the asset will generate probable future economic benefits. Also, the costs of items that are acquired for a particular research project and have no alternative future uses are expensed as the items are used in the project. In contrast, such costs are expensed when incurred under U.S. GAAP. Finally, international accounting standards allow intangibles to be revalued upwards. For example, in the United Kingdom, brand names such as Schweppes are accounted for in this manner.

### NEW! Link to Ratio Analysis

After introducing ratios in an appendix to Chapter 6, this feature continues that discussion and introduces students to calculations accountants, investors, and creditors perform to link the numbers to specific types of real world analysis. Considering the usefulness of ratios as a tool for analyzing the health of a business, this feature should prove interesting and useful to students, while honing their critical thinking skills.

*"I like the graphics and colors. This will allow instructors and students to identify and emphasize desired elements. It is a good way to include these challenging topics."*  
Mark Comstock-  
Missouri Southern  
State University

*"Yes, I think that it brings the attention to the reader effectively - I actually like the way it is done as it is placed right into the section where the concept is discussed and where/when the student is ready to consider it."*  
Vern Richardson-  
University of Arkansas

1  
3

## LINK TO RATIO ANALYSIS

While most U.S. companies use straight-line depreciation, they use varying estimates of service lives and residual values, which makes intercompany comparisons much more difficult. However, the required disclosures can be used by analysts to gain insights into a company's property, plant, and equipment. A useful measure that can be computed is the average age of a company's fixed assets. Consider the following data from **Intel's** 2004 annual report.

(in millions)	2004	2003
Accumulated Depreciation	\$24,065	\$22,031
Depreciation Expense	4,590	4,651
Depreciation Method	Straight-line	

Based on this information, the average age of Intel's property, plant, and equipment can be computed as follows:

$$\text{Average Age}_{2004} = \frac{\text{Accumulated Depreciation}}{\text{Depreciation Expense}} = \frac{\$24,065}{\$4,590} = 5.2 \text{ years}$$

$$\text{Average Age}_{2003} = \frac{\text{Accumulated Depreciation}}{\text{Depreciation Expense}} = \frac{\$22,031}{\$4,651} = 4.7 \text{ years}$$

## End of Chapter

Extensive end-of-chapter materials allow students to test their understanding, and apply concepts to a variety of questions and problems.

*The material is effective, and the quality and the quantity are good.*

Mark Comstock-  
Missouri Southern  
State University

**Questions** primarily address key concepts and terms in the chapter. These questions allow students to solidify their understanding of the basics before moving on to specific applications.

**Multiple-Choice Items** provide students with a variety of brief qualitative and quantitative tests of their knowledge. Starting with Chapter 2, each chapter contains ten multiple-choice activities based on past Uniform CPA Examination questions, providing sound preparation for the professional world.

**Exercises** reinforce a chapter topic and provide students an opportunity to explore their answers more thoroughly.

**Problems** consolidate a number of chapter topics or focus on a comprehensive analysis of a single topic. These multi-step items allow students to delve even further into the complex practice of accounting. Each problem is introduced by a subject reference in bold.

**Cases** focus on the various conceptual and reporting issues within the chapter. In accordance with the Accounting Education Change Commission recommendations about improving certain skills of students, we present cases at the end of each chapter in three sections. Each case is introduced by a subject reference in bold.

**Communication cases** are designed to help students improve their written communication skills. These cases prepare students for the future, when they will need to explain their findings to managers and other decision makers.

**Creative and Critical Thinking cases** are designed to help students improve their thinking skills. Due to the increased emphasis on enhancing students' abilities to think creatively and critically in the accounting environment, we include a section on these topics in Chapter 1.

**Ethics cases** deal with ethical and financial reporting issues in each chapter. Students should develop solutions from financial reporting and ethical perspectives, building on what they've learned through reading the discussion of ethical models in Chapter 1 and the Link to Ethical Dilemmas. Coverage of ethics is always denoted with this icon.

*"I really like the way this text was written. Move over Kieso!"*  
Rizvana  
Zameeruddin-  
University of  
Wisconsin-Parkside

**Research Simulations** are found in most chapters, and simulate real scenarios in which research would be needed in the professional world. We designed these cases to be used with the *FARS* electronic database, pronouncements on the FASB web site, the FASB Current Text, or the FASB Original Pronouncements, which helps students develop the research skills needed as an accounting professional.

## Other Features

**Analysis of Coca-Cola's Financial Statements** To give students insight into real-world financial reporting, several cases require students to review selected portions of The Coca-Cola Company's annual report (in Appendix A). These cases enhance critical-thinking skills as they require students to answer user-oriented and financial reporting questions related to the chapter topics.

**AICPA Adapted** In addition to being the only Intermediate Accounting textbook with AICPA adapted, multiple-choice questions, each chapter after Chapter 1 contains a variety of exercises, problems, and cases based on past Uniform CPA Examination questions.

**User-Oriented Homework** Selected exercises and problems require students to develop answers from a user-oriented perspective. These involve the computation of ratios as well as intracompany and intercompany analysis.

## CONTENT CHANGES

We have included detailed coverage of the latest FASB statements as well as many other enhancements to the book's content. As new statements are issued, we will provide timely updates at our web site, <http://nikolai.swlearning.com>. A list of chapter key changes from the ninth to tenth editions follows:

### Part 1 Financial Reporting: Concepts, Financial Statements, and Related Disclosures

#### Chapter 1

- Added FASB Staff Positions to GAAP
- Added discussion of objectives-oriented standard setting
- Added discussion of PCAOB

#### Chapter 2

- Modified Exhibit "Financial Reporting Environment" to add PCAOB

#### Chapter 3 (formerly Appendix C)

- Changed the entire example from a periodic to a perpetual inventory system
- Added a diagram to show information flow from source documents through to financial statements
- Added diagrams to show effect of each type of adjusting entry
- Added summary exhibit of adjusting entry framework
- Since switched to basic perpetual example, added a short section on periodic inventory, as well as returns, allowances, and discounts
- Moved worksheet ahead of reversing entries so it is in more proximity to the related financial statements
- Reduced the coverage of special journals to a basic discussion
- Moved cash-basis accounting to a chapter appendix

#### Chapter 4 (formerly Chapter 3)

- Added discussion of "fair value" based on new *FASB Statement*.

#### Chapter 5 (formerly Chapter 4)

- Added new section on purposes of the income statement
- Added discussion of FASB project on "financial performance reporting by business enterprises"

*They provide many choices with different levels of difficulty. Creative and Critical Thinking Cases provide an opportunity to enhance writing and communication skills. The Research Simulation will enforce the need to use the technology and articulate findings to the stakeholders.*  
Abdul Qastin-  
Lakeland College

- Added discussion of FASB and IASB joint project on revenue recognition
- Added margin notes to income statement to highlight different sections
- Modified discussion to reflect perpetual inventory system for cost of goods sold
- Deleted exhibit dealing with cost of goods sold for manufacturing company
- Modified diagram of income from discontinued operations
- Deleted discussion of reporting “cumulative effects” on income statement
- Added discussion of reporting “change in accounting principle” in retained earnings statement
- Modified diagram of cash flows from operating, investing, and financing activities
- Added margin notes to a statement of cash flows to highlight different sections

**Chapter 6 (formerly Chapter 5)**

- Added diagram showing how “efficient market” works
- Added discussion of new audit “opinions” required for internal control and replaced old audit opinion with new audit opinions
- Added exhibit to illustrate segment reporting
- Added new brief section on XBRL supplemental information for SEC reporting
- In chapter Appendix, added new diagram for computing days in operating cycle from ratios
- Deleted redundant discussion of Management’s Discussion and Analysis (MD&A) because it is covered in Chapter 4

**Time Value of Money Module**

- Created from Appendix D: Compound Interest and moved up for convenient, optional coverage

**Part 2 Financial Reporting: Asset Measurement and Income Determination**

**Chapter 7 (formerly Chapter 6)**

- Moved sections on Petty Cash and Bank Reconciliation to chapter appendix
- Added diagram showing pledging, assignment, and factoring conditions when financing with accounts receivable
- Clarified discounting notes receivable with recourse and without recourse
- Deleted appendix on four-column bank reconciliation
- Added an explanation of the effects of various accounts receivable and notes receivable transactions on the statement of cash flows

**Chapter 8 (formerly Chapter 7)**

- Updated for provisions of *FASB Statement No. 151*
- Deleted discussion of standard costs and variable costing
- Updated for provisions of *FASB Statement No. 154*
- Added an explanation of the effects of inventory transactions on the statement of cash flows

**Chapter 9 (formerly Chapter 8)**

- Clarified the discussion of the steps used for the gross profit method and retail inventory method of estimating inventory.

**Chapter 10 (formerly Chapter 9)**

- Added example of donation by nongovernmental entity
- Updated discussion of exchanges for *FASB Statement No. 153*, which eliminated similar asset exchanges. All nonmonetary asset exchanges are now recorded in the same way and all gains and losses are recognized in full
- Added an explanation of the effects of property, plant, and equipment transactions on the statement of cash flows

**Chapter 11 (formerly Chapter 10)**

- Moved discussion of activity-based depreciation methods
- Deleted discussion of retirement and replacement methods
- Updated discussion of Changes and Corrections of Depreciation for *FASB Statement No. 154*. A change in a depreciation method is now accounted for prospectively (instead of by a cumulative effect adjustment)

**Chapter 12 (formerly Chapter 11)**

- Deleted Appendix on Estimating the Value of Goodwill, but added a short discussion.

### **Part 3 Financial Reporting: Valuation of Liabilities and Investments**

#### **Chapter 13 (formerly Chapter 12)**

- Shortened liquidity discussion
- Added a journal entry example for dividends
- Added a diagram to explain the differences in accounting for vacation time and sick pay
- Clarified the accounting for an unconditional purchase obligation

#### **Chapter 14 (formerly Chapter 13)**

- Added a diagram for the computation of the bond discount or premium amortization
- Added a diagram explaining the book value and market value methods for the conversion of bonds
- Added a diagram showing the payments for an impaired loan
- Added a discussion of accounting for guarantees under *FASB Interpretation No. 45*
- Added an explanation of the effects of long-term liability transactions on the statement of cash flows

#### **Chapter 15 (formerly Chapter 14)**

- Expanded the discussion of “other than temporary” losses
- Added an explanation of the effects of investment transactions on operating cash flows

### **Part 4 Financial Reporting: Stockholders’ Equity**

#### **Chapter 16 (formerly Chapter 15)**

- Adjusted discussion of stock subscriptions
- Added some discussion of political controversy about compensatory share (stock) option plans
- Revised discussion of compensatory share option plans
- Replaced discussion of intrinsic method for stock appreciation rights with discussion of newly required fair value method
- Eliminated discussion of intrinsic value method for compensatory share option plans
- Updated discussion of redeemable preferred stock for new GAAP
- Shortened discussion of par value method for treasury stock, eliminated numerical example, and moved to end of section.
- Added a section that explains the effects of capital stock transactions on the statement of cash flows

#### **Chapter 17 (formerly Chapter 16)**

- Added numerical example of computing simple basic earnings per share
- Clarified the discussion of effect of stock dividends and splits on EPS
- Shortened and clarified conceptual and procedural discussion of stock dividends
- Shortened discussion of restrictions of retained earnings
- Omitted chapter appendix on quasi-reorganizations because of their rarity

### **Part 5 Financial Reporting: Special Topics**

#### **Chapter 18 (formerly Chapter 17)**

- Moved the discussion of Additional Revenue Recognition Issues to an Appendix

#### **Chapter 19 (formerly Chapter 18)**

- Changed “deductible temporary difference” to “future deductible amount” and changed “taxable temporary difference” to “future taxable amount”
- Shortened conceptual discussion of deferred assets, deferred liabilities, and measurement of deferred items and valuation allowance
- For each primary example, substituted series of steps explaining measuring and recording deferred taxes, instead of discussing in paragraph format
- Shortened conceptual discussion of operating carrybacks and forwards
- Adjusted intraperiod income tax allocation discussion for elimination of cumulative effect changes
- Eliminated discussion of investment tax credit
- Eliminated chapter appendix on additional conceptual issues regarding interperiod tax allocation
- Added a section that explains the effects of income tax transactions on the operating activities section of the statement of cash flows

**Chapter 20** (formerly Chapter 19)

- Updated the discussion of disclosures for *FASB Statement No. 132R*
- Deleted the discussion of the transition requirements of *FASB Statement No. 87* and *No. 106*
- Added a section that explains the effects of pension transactions on the statement of cash flows

**Chapter 21** (formerly Chapter 20)

- Increased clarity of account titles (e.g., Leased Equipment under Capital Lease is now Leased Equipment, and Obligation Under Capital Lease is now Capital Lease Obligation)
- Added a section that explains the effects of lease transactions on the statement of cash flows

**Chapter 22** (formerly Chapter 21)

- Changed cash “inflows” to “receipts” and “outflows” to “payments” in many places to simplify
- Deleted Exhibit “Differences Between Revenues, Expenses, and Cash Flows from Operating Activities”
- Moved Exhibit “Calculation of Cash Flows from Operating Activities” and related revised discussion to chapter appendix because it relates more to direct method
- Added headings to discussion of worksheet method (indirect method) to make it easier for students to follow steps for completion
- Added “increase” or “decrease” to “Schedule to Compute Operating Cash Flows” to clarify changes in selected balance sheet accounts
- Added headings to discussion of worksheet method (direct method) in chapter appendix to make it easier for students to follow steps for completion

**Chapter 23** (formerly Chapter 22)

- Completely revised the Chapter for *FASB Statement No. 154*. All changes in accounting principle are now accounted for by a retrospective application of the new accounting principle on the retained earnings statement instead of a cumulative effect adjustment on the income statement

## RELATE, INNOVATE, AND MOTIVATE

Students master course concepts through cutting-edge, interactive supplements unparalleled in the market.

### Your Course. Your Time. Your Way.

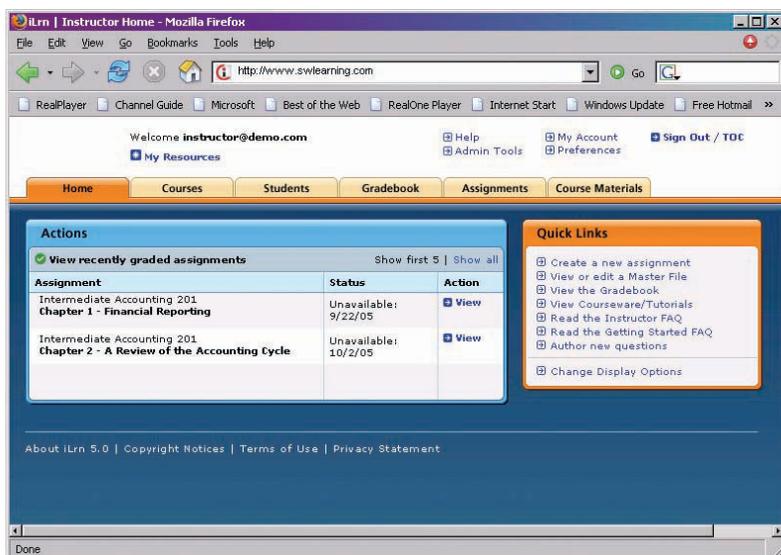

Introducing  for Nikolai/Bazley/Jones *Intermediate Accounting 10e*

This powerful and fully integrated online teaching and learning system provides you with flexibility and control; saves valuable time and improves outcomes. Your students benefit

by having choices in the way they learn through our unique personalized learning path. All this made possible by ThomsonNOW!

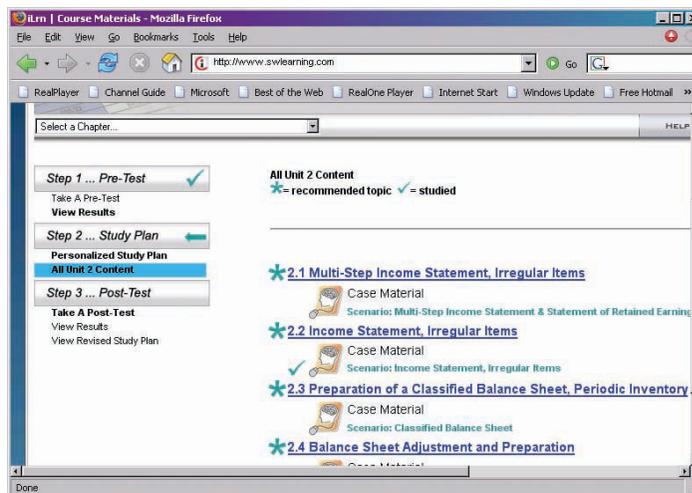

- Homework, including algorithms
- Integrated eBook
- Personalized Learning Paths
- Interactive Course Assignments
- Assessment Options with algorithms
- Test Delivery
- Course Management Tools, including Grade Book
- WebCT & Blackboard Integration

Understanding concepts, knowing GAAP rules, and learning exceptions is critical to a student’s success in Intermediate Accounting. ThomsonNOW launches that

success into the professional world by providing students with a Personalized Learning Path:

- Organized by topic, each student is directed to complete a diagnostic pre-assessment.
- The results of this pre-assessment generate an Individualized Learning Path that contains links to cases where students practice research, communication, tabulation, analysis and reporting.
- A post-assessment is also available, so that students can gauge their progress and comprehension of the concepts and skills necessary to successfully perform as an Accounting Professional.

## Intermediate Accounting Companion Web Site

<http://nikolai.swlearning.com>

This dramatically improved Internet site contains more resources for both students and instructors than ever before, and it's completely FREE!

For the STUDENT, it contains

- **BCRC Infomarks:** Direct links to the sources cited in the "For Further Research" boxes in each chapter opener, so there is no need to search for these articles.
- **Key Terms Quizzing:** This matching tool allows students to test themselves on key terms found in the text.
- **Crosswords:** Provides another way to familiarize students with the vocabulary of Intermediate Accounting through an entertaining game.
- **Interactive Quizzes:** Provide a test of basic knowledge of the chapter content and provide immediate feedback on the accuracy of the response. These quizzes contain multiple-choice, true/false, and brief exercise items that help students pinpoint areas in which they need more study.
- **Advanced Interactive Quizzes:** This next level of Interactive Quizzing is tied directly to the items recapped in the Secure Your Knowledge feature and Chapter Objectives. This test also consists of contain multiple-choice, true/false, and brief exercise items and provides immediate feedback.
- **Annotated Spreadsheets:** Similar to material found in the end of the chapter, these Excel® spreadsheet templates have annotated steps to help walk students through some of the most difficult problems types.
- **Internet Assignments:** Make full use of information that can be found on the Web with these research activities. These assignments require students to answer questions based on a company's most current financial statements. In many cases, students must analyze the disclosures from an external user's perspective.
- **Videos:** These brief videos provide overviews of the effects of certain characteristics of the business world. Such topics include the effect of fraud, goodwill, and SEC on everyday business.

- Students can download many of the available supplements and see additional resources including,

Student PowerPoint® Presentation	Appendix: Accounting for Changes in Price
Enhanced Excel® Templates	Present Value Table
Links to accounting-related resources	Sample chapter for the Problem Solving Strategy Guide
Any FASB Updates	
Check Figures	

For INSTRUCTORS, this web site contains password protected downloads of the

Solutions Manual	Enhanced Excel® template solutions
Instructor's Manual	Links to accounting-related resources
Instructor's PowerPoint® Presentation	Any FASB Updates and related solutions
Test Bank files in Word	Appendix: Accounting for Changes in Price
Test Bank files in Examview	Present Value Tables
Check Figures	

There is a "Communicate with the Authors" link for sending e-mail. As mentioned, the authors will post updates to this site to keep adopters informed of the latest FASB pronouncements.

**JoinIn on Turning Point** is interactive PowerPoint®, simply the best classroom response system available today! JoinIn allows lectures to be transformed into powerful, two-way experiences. This lecture tool makes full use of the Instructor's PowerPoint® presentation, but moves it to the next level with interactive questions that provide immediate feedback on the students' understanding of the topic at hand. Visit <http://turningpoint.thomsonlearningconnections.com/index.html> to find out more!

ISBN: 0324378238

**WebTutor® Toolbox on WebCT® or Blackboard®** Available on both platforms, this rich course management product is a specially designed extension of the classroom experience that enlivens the course by leveraging the power of the Internet with comprehensive educational content. Instructors or students can use these resources along with those on the Product Web Site to supplement the classroom experience. Use this effective resource as an integrated solution for your distance learning or web-enhanced course! Contact your local sales representative for details! <http://webtutor.swlearning.com>

## SUPPLEMENTS

*Intermediate Accounting's* supplement package is comprised of a comprehensive set of teaching and learning tools that are as carefully developed as the book itself. From print-based supplements to electronic study aids, you're sure to find top-quality support in this thoroughly reviewed and verified set of supplements.

### Instructors Resources

**Solutions Manual** This two-volume manual includes: a suggested solution for each question, multiple-choice item, exercise, problem, case, and research simulation; all supporting calculations; and helpful notes to the instructor concerning any difficult areas within each problem. It also includes content and difficulty analysis of the exercises and problems in each chapter, as well as a sample syllabus and a list of assignments appropriate for group activities. This manual is personally prepared and verified by Loren Nikolai, John Bazley, and Jeff Jones.

Volume 1, Chapters 1–12 & Time Value of Money Module ISBN: 0324400594

Volume 2, Chapters 13–23 ISBN: 0324400640

**Solution Transparencies** This two-volume set of acetates (set in large, bold type) for all problems and exercises adds an important visualization element to classroom presentations and discussions.

Volume 1, Chapters 1–12 & Time Value of Money Module ISBN: 0324400586

Volume 2, Chapters 13–23 ISBN: 0324400578

**Instructor’s Manual** For each chapter, this manual provides a list of objectives, synopsis, lecture outline, instructional notes, and content analysis of exercises and problems by topic. Illustrative teaching transparency masters consisting of selected exhibits from the text can be easily made into overheads for use in lecture presentations. Check figures of key answers to all text exercises and problems are also provided. Finally, there are suggested solutions for the Link to Ethics feature. Included with the Instructor’s Manual files are the compound interest tables from the Time Value of Money Module. Prepared by Loren Nikolai, John Bazley, and Jeff Jones.

Only available electronically on the IRCD and Companion web site

**Test Bank** With examination materials covering each chapter, this updated two-volume bank includes approximately 2,100 multiple-choice, essay, and short-answer problems and solutions. In addition, it provides a grid that correlates each question to the individual chapter’s objectives, as well as a ranking of difficulty based on a clearly described categorization. Through this helpful grid, making a test that is comprehensive and well-balanced is a snap!

Volume 1, Chapters 1–12 & Time Value of Money Module ISBN: 0324406843

Volume 2, Chapters 13–23 ISBN: 0324406835

**ExamView®** This electronic testing software makes it easy to edit questions and customize exams. Containing the same questions as the printed Test Bank, the questions are correlated to the individual chapter’s objectives and ranked by difficulty. This correlation is reflected in the general information for the question, so it’s easy to sort by chapter objective or level of difficulty through ExamView®. This software requires PC compatibility.

Only available electronically on the IRCD and Companion web site

**Instructor’s PowerPoint®** These colorful and detailed slides enhance lectures and class discussion, and include key exhibits from the text. MS-Windows® is required. Note that a separate outline version is available for students.

Only available electronically on the IRCD and Companion web site

**Instructor Excel® Templates** These templates provide the solutions for the problems and exercises that have Enhanced Excel® templates for students. Through these files, instructor’s can see the solutions in the same format as the students.

Only available electronically on the IRCD and Companion web site

**Instructor’s Resource CD-ROM** This CD-Rom contains electronic files for all the resources an instructor needs to teach from this text. It includes the computerized test bank in ExamView® format and the ExamView® testing software, as well as the Microsoft Word files for the Instructor’s Manual, printed Test Bank, and Solutions Manual. Finally, this handy reference contains the Instructor PowerPoint Presentations and Excel® Templates.

ISBN: 0324400527

**Instructor’s Edition for Nikolai/Bazley/Jones’ Intermediate Accounting, 10th** This enhanced version of the core text comes equipped with a series of useful tabs that guide instructor’s through the key features of the textbook and its accompanying supplements.

ISBN: 0324375794

**Thomson Custom Solutions** This service develops personalized solutions to meet your business education needs. Match your learning materials to your syllabus and create

the perfect learning solution. Consider the following when looking at your customization options for Nikolai/Bazley/Jones, *Intermediate Accounting 10e*:

- Remove chapters you do not cover or rearrange their order, creating a streamlined and efficient text
- Customize our split volumes to meet the unique needs of your students or to match your two-semester sequence
- Add your own material to cover new topics or information, saving you time in planning and providing students a fully integrated course resource
- Adopt a loose-leaf version of the text allowing students to integrate your handouts; this money-saving option is also more portable than the full book

## Students Resources

**NEW! Problem Solving Strategy Guide** Provides a variety of tutorial material to facilitate thorough understanding of the key points from each chapter. In addition, this guide provides a series of new exercises and problems, many of which are accompanied by worked out solutions and study tips. More than just a study guide, the PSSG includes detailed strategies for solving complex problems types similar to those from the textbook.

Volume 1, Chapters 1–12 & Time Value of Money Module ISBN: 0324406819

Volume 2, Chapters 13–23 ISBN: 0324374291

**Student PowerPoint®** These colorful and detailed slides provide an outline version of the presentation instructor's use in class lectures. Be prepared for each class meeting by viewing this helpful outline beforehand. MS-Windows® is required.

Only available electronically on the IRCD and Companion web site

**Enhanced Excel® Templates** These templates are provided for selected long or complicated end-of-chapter exercises and problems, and provide assistance to the student as they set up and work the problem. Certain cells are coded to display a red asterisk when an incorrect answer is entered, which helps students stay on track. Selected problems that can be solved using these templates are designated by an icon.

These helpful templates appear on both the Companion web site

<http://nikolai.swlearning.com> and ThomsonNOW.

**Intermediate Accounting Text, Volume 1, 10th** This softbound volume of the core text provides a lighter and lower cost alternative to purchasing the complete, hardbound text. Perfect for students only taking one semester of *Intermediate Accounting*, Volume 1 contains material for Chapter 1–12 and the Time Value of Money Module.

ISBN: 0324374275

**Intermediate Accounting Text, Volume 2, 10th** This softbound volume of the core text provides a lighter and lower cost alternative to purchasing the complete, hardbound text. Perfect for students only taking one semester of *Intermediate Accounting*, Volume 2 contains material for Chapter 13–23 and the Time Value of Money Module.

ISBN: 0324374283

**INTACCT: Internet Accounting Tutor** Professors often find that the most basic rules and information that students learned in the introductory accounting course have long been forgotten when the students arrive in Intermediate Accounting. With the INTACCT Financial Accounting Tutorial, students easily review the basic introductory accounting concepts that they may have forgotten over the summer. It clearly explains the concept and then uses problem demonstrations to illustrate the concept and its applications.

In addition to the Financial Tutorial, the INTACCT Intermediate Tutorial provides a variety of materials to help reinforce concepts that students learn in class and supplement the explanations given in the text. This Tutorial explains some of the difficult and basic Intermediate accounting concepts and then uses problem demonstrations to illustrate

those concepts and their application. Review questions and interactive quizzing is available through this tool and the Financial Accounting Tutorial.

Check out the Companion web site for a link to purchase this useful tool!

<http://rama.swlearning.com>

### Practice Cases

- Sharkey Incorporated—This case study allows the students to assume the role of a financial consultant for Sharkey, Inc. for a two-year term. The goal of the case study is for the student to maximize both earnings per share and return on assets.
- Foxcor Manufacturing Company—This comprehensive practice case pulls together the concepts learned in the first half of the intermediate accounting course. The case also draws on theory and concepts learned in foundation accounting courses. After completing this case, students will be able to read and interpret the financial statements and understand how individual journal entries support a set of financial statements and related footnote disclosures.

Check out the Companion web site for a link to purchase these useful tools!

**Accounting and Auditing Research Tools and Strategies, Sixth Edition** This step-by-step guide to professional research is integrated with ResearchLink, a new suite of online research tools, tutorials, demos, research cases, and links to accounting and business research sites and standard-setting organizations.

Completely revised and updated, the Sixth Edition now includes new guidance for research stemming from the Sarbanes-Oxley Act, principles- and rules-based standard setting, the PCAOB, the AICPA's SAS 99 fraud auditing standards, and the AICPA's anti-fraud program.

Written by Thomas R. Weirich, Central Michigan University; Thomas C. Pearson, University of Hawaii; and Alan Reinstein, Wayne State University.

Check out the Companion web site for a link to purchase this useful tool!

## ACKNOWLEDGEMENTS

We are grateful to our respective Schools of Accountancy and to the American Institute of Certified Public Accountants, the Financial Accounting Standards Board, and the Institute of Certified Management Accountants of the Institute of Management Accountants for granting us permission to quote from their respective pronouncements and use their examination questions and unofficial answers. We are also grateful to our wives, children, and friends, who provided us with considerable moral support and understanding during the entire manuscript process. Finally, we'd like to acknowledge our publishing team, Keith Chasse, Chris McNamee, Steve Joos, and Bob Dreas for all of their assistance to ensure the textbook the best that it could be.

Most importantly, we would like to express our appreciation to those who served as reviewers and who provided insightful comments and valuable suggestions in the planning and writing of this textbook:

We wish to express appreciation to users of the earlier editions who provided meaningful comments and constructive criticism. We are grateful to Professors Larry Sallee, Winona State University; Scott Summers, Brigham Young University; Paul Miller, University of Colorado at Colorado Springs; Geri Wink, Colorado State University at Pueblo; James C. Buckley, Mesa State College; Norman A. Sunderman, Angelo State University; Peggy Dwyer, University of Central Florida; Robin Roberts, University of Central Florida; Kenneth R. Lambert, University of Memphis; Sandra D. Byrd, Missouri State University; Rita J. Hopewell; T.J. Atwood, Kansas State University; Ben Hsien Bao, Hong Kong Polytechnic University; John Sweeney, Washington State University; Sun Kim, SUNY-Buffalo; Brad Jordan, University of Kentucky; Ray Brooks, Oregon State University; Doug Cloud, Pepperdine University-Malibu; and Inder Khurana and Billie Cunningham, University of Missouri-Columbia for their reactions to selected topics. Special thanks go to Donald Green, Scott I. Jerris, San Francisco State University; Paula Kock; Walter Parker; Norma Powell, University of Massachusetts at Lowell; and Daryl G. Krause, CPA, for their contributions of homework. We also wish to thank our graduate and undergraduate students, including Jenny Reed, Beth Adair, JoAnne Leuders, Stephen Underhill, Devra Niemann, Teresa Hickam, Cherie Wadlin, Trish Nikolai, Lori Thompson, Lisa Klempert, Lori Hamilton, Terry Phillips, Theresa Spaedy, Kyle Newell, Carrie Hammond, Cassi Costner, Emily Kliethermes, Nathan Troup, Herman Eckerle, Kelli Strubinger, and Sarah Hooper. We are sincerely indebted to our typists, Anita Blanchar, Karen Staggs, and Mary Meyer, whose quality work and perseverance enabled us to complete the manuscript in a timely and orderly fashion.

## Reviewers of the Ninth Edition

Richard C. Brooks <i>West Virginia University</i>	Jeff Ritter Associate Professor of Business Administration <i>St. Norbert College</i>

## PART 1

### Financial Reporting: Concepts, Financial Statements, and Related Disclosures

#### 1 The Environment of Financial Reporting 2

- ACCOUNTING INFORMATION: USERS, USES, AND GAAP 4
  - External and Internal Users 5
  - Financial and Managerial Accounting Information Systems 6
  - Financial Reporting 7
  - Generally Accepted Accounting Principles 8
- THE ESTABLISHMENT OF ACCOUNTING STANDARDS 9
  - Committee on Accounting Procedure (CAP) 10
  - Accounting Principles Board (APB) 10
  - Financial Accounting Standards Board (FASB) 11
  - Other Organizations Currently Influencing Generally Accepted Accounting Principles 16
- ETHICS IN THE ACCOUNTING ENVIRONMENT 21
- CREATIVE AND CRITICAL THINKING IN THE ACCOUNTING ENVIRONMENT 23

#### 2 Financial Reporting: Its Conceptual Framework 30

- FASB CONCEPTUAL FRAMEWORK 32
- OBJECTIVES OF FINANCIAL REPORTING 34
  - Information Useful in Decision Making 35
  - Information Useful to External Users in Assessing Future Cash Receipts 35
  - Information Useful in Assessing Company Cash Flows 36
  - Information About Economic Resources and Claims to These Resources 36
  - Information About Comprehensive Income and Its Components 36
  - Information About Cash Flows 37
  - Other Issues 37
- TYPES OF USEFUL INFORMATION 38
  - Return on Investment 38
  - Risk 38
  - Financial Flexibility 39
  - Liquidity 39
  - Operating Capability 39
- QUALITATIVE CHARACTERISTICS OF USEFUL ACCOUNTING INFORMATION 40
  - Hierarchy of Qualitative Characteristics 40
  - Understandability 40
  - Decision Usefulness 41
  - Relevance 41
  - Reliability 42

- Comparability and Consistency 43
- Constraints to the Hierarchy 43
- ACCOUNTING ASSUMPTIONS AND PRINCIPLES 45
  - Entity (Assumption) 45
  - Continuity (Assumption) 46
  - Period of Time (Assumption) 47
  - Monetary Unit (Assumption) 48
  - Historical Cost (Principle) 48
  - Recognition (Principle) 49
  - Matching and Accrual Accounting (Principles) 50
  - Conservatism (Principle) 51
- GAAP AND FINANCIAL STATEMENTS 51
  - Balance Sheet 52
  - Income Statement 53
  - Statement of Cash Flows 53
  - Statement of Changes in Equity 54
  - Model of Business Reporting 54
- IASB FRAMEWORK 56
- OVERVIEW 56

#### 3 Review of a Company's Accounting System 64

- THE ACCOUNTING SYSTEM 66
  - Accounting Equation 66
  - Transactions, Events, and Supporting Documents 67
  - Accounts 67
  - Financial Statements 69
- THE ACCOUNTING CYCLE 70
  - Recording in the General Journal (Step 1) 70
  - Posting to the Ledger (Step 2) 73
  - Preparation of Adjusting Entries (Step 3) 76
  - Preparation of the Financial Statements (Step 4) 81
  - Preparation of Closing Entries (Step 5) 84
  - Additional Issues 86
- WORKSHEET (SPREADSHEET) 88
- REVERSING ENTRIES 90
  - Example: Reversing Entry 91
- SUBSIDIARY LEDGERS 92
- SPECIAL JOURNALS 93
- COMPUTER SOFTWARE 94
- APPENDIX: CASH-BASIS ACCOUNTING 95

#### 4 The Balance Sheet and the Statement of Changes in Stockholders' Equity 116

- INTERRELATIONSHIP OF FINANCIAL STATEMENTS 118
- PURPOSES OF THE BALANCE SHEET 119
  - Liquidity, Financial Flexibility, and Operating Capability 120
  - Capital and Capital Maintenance 120
- RECOGNITION IN THE BALANCE SHEET 121
- ELEMENTS OF THE BALANCE SHEET 121
  - Assets 122

- Liabilities 122
  - Stockholders' Equity 123
- MEASUREMENT OF THE ELEMENTS OF THE BALANCE SHEET 123
  - Historical Cost 123
  - Current Cost 123
  - Current Market Value 123
  - Net Realizable Value 124
  - Present Value 125
  - Valuations on Today's Balance Sheet 125
  - Limitations of the Balance Sheet 126
- REPORTING CLASSIFICATIONS ON THE BALANCE SHEET 127
  - Current Assets 128
  - Current Liabilities 129
  - Working Capital 131
  - Long-Term Investments 132
  - Property, Plant, and Equipment 133
  - Intangible Assets 134
  - Other Assets 134
  - Long-Term Liabilities 134
  - Other Liabilities 136
  - Conceptual Guidelines for Reporting Assets and Liabilities 136
  - Stockholders' Equity 137
  - Contributed Capital 137
  - Capital Stock and Additional Paid-In Capital 138
  - Retained Earnings 139
  - Accumulated Other Comprehensive Income 139
  - Miscellaneous Items 140
- STATEMENT OF CHANGES IN STOCKHOLDERS' EQUITY 140
- OTHER DISCLOSURE ISSUES 141
  - Summary of Accounting Policies 141
  - Fair Value and Risk of Financial Instruments 142
  - Loss and Gain Contingencies 143
  - Subsequent Events 144
  - Related Party Transactions 144
  - Comparative Financial Statements 145
  - Auditor's Report 145
  - SEC Integrated Disclosures 145
  - Miscellaneous Disclosures 146
- REPORTING TECHNIQUES 148
  - Statement Format (Balance Sheet) 148
  - Combined Amounts 148
  - Rounding 148
  - Notes, Supporting Schedules, and Parenthetical Notations 149
- ILLUSTRATIVE STATEMENTS 149

#### 5 The Income Statement and Statement of Cash Flows 168

- CONCEPTS OF INCOME 170
  - Capital Maintenance Concept 170
  - Transactional Approach 171
- PURPOSES OF THE INCOME STATEMENT 173

**8 Inventories: Cost Measurement and Flow Assumptions 358**

- CLASSIFICATIONS OF INVENTORY 360
  - Raw Materials Inventory 360
  - Work in Process Inventory 360
  - Finished Goods Inventory 361
  - Reporting Inventory in a Company's Financial Statements 361
  - Inventories of Service Companies 362
- ALTERNATIVE INVENTORY SYSTEMS 362
  - Perpetual Inventory System 362
  - Periodic Inventory System 362
- ITEMS TO BE INCLUDED IN INVENTORY QUANTITIES 363
- DETERMINATION OF INVENTORY COSTS 364
  - Purchases Discounts 365
- COST FLOW ASSUMPTIONS 367
  - Specific Identification 368
  - First-In, First-Out (FIFO) 369
  - Average Cost 370
  - Last-In, First-Out (LIFO) 371
  - Comparison of Inventory Cost Flow Assumptions 373
- CONCEPTUAL EVALUATION OF INVENTORY COST FLOW ASSUMPTIONS 374
  - Income Measurement 374
  - Income Tax Effects 375
  - Liquidation of LIFO Layers 376
  - Earnings (Income) Management 377
  - Inventory Valuation 378
  - Average Cost 378
  - Management's Selection of an Inventory Cost Flow Assumption 379
- DOLLAR-VALUE LIFO 381
  - Example: Dollar-Value LIFO 382
  - Determination of Cost Index 383
  - Inventory Pools 385
- ADDITIONAL LIFO CONSIDERATIONS 387
  - LIFO Valuation Adjustment 387
  - Interim Statements Using LIFO 387
  - Change to or from LIFO 388
- DISCLOSURE OF INVENTORY VALUES AND METHODS 389
- APPENDIX: FOREIGN CURRENCY TRANSACTIONS INVOLVING INVENTORY 392
  - Example: Exchange Gain 393
  - Example: Exchange Loss 393

**9 Inventories: Special Valuation Issues 412**

- LOWER OF COST OR MARKET 414
  - Application of Lower of Cost or Market Method 414
  - Conceptual Evaluation of the Ceiling and Floor 416
  - Approaches to Implementing Lower of Cost or Market Rule 418
  - Recording the Reduction of Inventory to Market 419
  - LCM: Direct Method (Periodic) 419

- LCM: Indirect Method (Periodic) 420
- LCM: Perpetual 420
- LCM: Reporting 420
- Lower of Cost or Market and Interim Financial Statements 421
- CONCEPTUAL EVALUATION OF LOWER OF COST OR MARKET 421
- PURCHASE OBLIGATIONS AND PRODUCT FINANCING ARRANGEMENTS 423
- VALUATION ABOVE COST 424
- GROSS PROFIT METHOD 426
  - Example: Gross Profit Method 426
  - Conceptual Evaluation of the Gross Profit Method 427
- RETAIL INVENTORY METHOD 428
  - Example: Retail Inventory Method 428
  - Retail Inventory Method Terminology 429
  - Application of the Retail Inventory Method 429
  - Additional Cost and Retail Adjustments 433
  - Comparison of Methods 434
- CONCEPTUAL EVALUATION OF THE RETAIL INVENTORY METHOD 434
- DOLLAR-VALUE LIFO RETAIL METHOD 437
- EFFECTS OF INVENTORY ERRORS 439
- SUMMARY OF INVENTORY ISSUES 442

**10 Property, Plant, and Equipment: Acquisition and Disposal 458**

- CHARACTERISTICS OF PROPERTY, PLANT, AND EQUIPMENT 460
  - Evaluation of Use of Historical Cost 460
- ACQUISITION OF PROPERTY, PLANT, AND EQUIPMENT 461
  - Determination of Cost 461
  - Lump-Sum Purchase 463
  - Deferred Payments 464
  - Issuance of Securities 464
  - Assets Acquired by Donation 465
  - Start-up Costs 466
- NONMONETARY ASSET EXCHANGES 466
  - Example: Exchanges of Nonmonetary Assets 467
  - Exceptions to the General Rule to Use Fair Value for Nonmonetary Exchanges 468
- SELF-CONSTRUCTION 469
  - Interest During Construction 469
  - Fixed Overhead Costs 474
  - Income on Self-Construction 475
  - Development Stage Companies 475
- COSTS AFTER ACQUISITION 476
  - Additions 476
  - Improvements and Replacements 476
  - Rearrangement and Moving 477
  - Repairs and Maintenance 477
- DISPOSAL OF PROPERTY, PLANT, AND EQUIPMENT 478
  - Asset Retirement Obligations 479
- DISCLOSURE OF PROPERTY, PLANT, AND EQUIPMENT 481

- APPENDIX: OIL AND GAS PROPERTIES 483

**11 Depreciation and Depletion 502**

- FACTORS INVOLVED IN DEPRECIATION 504
  - Asset Cost 504
  - Service Life 504
  - Residual Value 505
- METHODS OF COST ALLOCATION 505
  - Time-Based Methods 506
  - Activity Methods 509
- RECORDING DEPRECIATION 510
- CONCEPTUAL EVALUATION OF DEPRECIATION METHODS 511
- DISCLOSURE OF DEPRECIATION 513
- ADDITIONAL DEPRECIATION METHODS 515
  - Group Depreciation 515
  - Composite Depreciation 516
  - Inventory Systems 518
- DEPRECIATION FOR PARTIAL PERIODS 518
  - Compute Depreciation to the Nearest Whole Month 519
  - Compute Depreciation to the Nearest Whole Year 520
  - Compute One-Half Year's Depreciation on All Assets Purchased or Sold During the Year 520
- IMPAIRMENT OF PROPERTY, PLANT, AND EQUIPMENT 520
  - Impairment Test 521
  - Measurement of the Loss 521
  - Recording and Reporting the Loss 521
  - Disclosures 521
  - Example: Impairment Loss 522
  - Conceptual Evaluation of Asset Impairment 523
- DEPRECIATION AND INCOME TAXES 524
  - MACRS Principles 525
  - Example: MACRS 526
- CHANGES AND CORRECTIONS OF DEPRECIATION 528
- DEPLETION 528

**12 Intangibles 548**

- ACCOUNTING FOR INTANGIBLES 550
  - Cost of Intangibles 550
  - Amortization or Impairment of Intangible Assets 552
- RESEARCH AND DEVELOPMENT COSTS 554
  - Conceptual Evaluation of Accounting for Research and Development Costs 556
- IDENTIFIABLE INTANGIBLE ASSETS 557
  - Patents 557
  - Copyrights 559
  - Franchises 559
  - Computer Software Costs 559
  - Internal-Use Software 561
  - Leases and Leasehold Improvements 562
  - Trademarks and Tradenames 562

Deferred Charges 562  
 Organization Costs 562  
 UNIDENTIFIABLE INTANGIBLES 563  
 Internally Developed Goodwill 563  
 Purchased Goodwill 563  
 Impairment of Goodwill 564  
 Negative Goodwill 565  
 Estimating the Value of  
 Goodwill 566  
 DISCLOSURES FOR INTANGIBLE  
 ASSETS 567  
 CONCEPTUAL EVALUATION  
 OF ACCOUNTING FOR  
 INTANGIBLES 568

## **PART 3**

### **Financial Reporting: Valuation of Liabilities and Investments**

#### **13 Current Liabilities and**

**Contingencies 586**  
 CONCEPTUAL OVERVIEW OF  
 LIABILITIES 588  
 NATURE AND DEFINITION OF  
 CURRENT LIABILITIES 589  
 Classification and the Operating  
 Cycle or Year 589  
 Liquidity, Financial Flexibility, and  
 Current Liabilities 589  
 Classification of Current  
 Liabilities 590  
 VALUATION OF CURRENT  
 LIABILITIES 591  
 CURRENT LIABILITIES HAVING A  
 CONTRACTUAL AMOUNT 591  
 Trade Accounts Payable 591  
 Notes Payable 592  
 Currently Maturing Portion of  
 Long-Term Debt 594  
 Dividends Payable 594  
 Advances and Refundable  
 Deposits 595  
 Accrued Liabilities 595  
 Unearned Items 598  
 CURRENT LIABILITIES WHOSE  
 AMOUNTS DEPEND ON  
 OPERATIONS 599  
 Sales and Use Taxes 599  
 Liabilities Related to Payrolls 600  
 Income Taxes Payable 602  
 Bonus Obligations 602  
 CURRENT LIABILITIES REQUIRING  
 AMOUNTS TO BE ESTIMATED 605  
 Property Taxes 605  
 Warranty Obligations 606  
 Premium and Coupon  
 Obligations 609  
 CONTINGENCIES 611  
 Accrual of Loss Contingencies 613  
 Disclosure of Loss Contingencies in  
 the Notes to the Financial  
 Statements 614  
 Disclosure of Gain Contingencies  
 in the Notes to the Financial  
 Statements 615  
 Executory Contracts 615  
 Illustrations of Contingency  
 Disclosures 615

OTHER LIABILITY CLASSIFICATION  
 ISSUES 617  
 Short-Term Debt Expected to Be  
 Refinanced 617  
 Classification of Obligations That  
 Are Callable by the Creditor 619  
 FINANCIAL STATEMENT  
 PRESENTATION OF CURRENT  
 LIABILITIES 620

#### **14 Long-Term Liabilities and Receivables 638**

REASONS FOR ISSUANCE OF LONG-  
 TERM LIABILITIES 640  
 BONDS PAYABLE 640  
 Characteristics of Bonds 641  
 Bond Selling Prices 641  
 RECORDING THE ISSUANCE OF  
 BONDS 643  
 Bonds Issued Between Interest  
 Payment Dates 644  
 AMORTIZING DISCOUNTS AND  
 PREMIUMS 645  
 Straight-Line Method 645  
 Effective Interest Method 648  
 Bond Issue Costs 651  
 Accruing Bond Interest 652  
 Zero-Coupon Bonds 653  
 EXTINGUISHMENT OF  
 LIABILITIES 654  
 Bonds Retired at Maturity 654  
 Bonds Retired Prior to  
 Maturity 654  
 BONDS WITH EQUITY  
 CHARACTERISTICS 656  
 Bonds Issued with Detachable  
 Stock Warrants 656  
 Convertible Bonds 657  
 LONG-TERM NOTES PAYABLE 661  
 Notes Payable Issued for Cash 662  
 Notes Payable Exchanged for Cash  
 and Rights or Privileges 663  
 Notes Payable Exchanged for  
 Property, Goods, or Services 664  
 Disclosure of Long-Term  
 Liabilities 665  
 LONG-TERM NOTES  
 RECEIVABLE 667  
 Loan Fees 671  
 Impairment of a Loan 671  
 Guarantees 675  
 Future Developments 675  
 APPENDIX 1: TROUBLED DEBT  
 RESTRUCTURINGS 676  
 ACCOUNTING BY THE DEBTOR 676  
 Modification of Terms 677  
 Equity or Asset Exchange 679  
 Equity or Asset Exchange  
 Combined with a Modification of  
 Terms 679  
 Disclosure of Restructuring  
 Agreements 680  
 ACCOUNTING BY THE  
 CREDITOR 680  
 Equity or Asset Exchange 680  
 Modification of Terms 681  
 Equity or Asset Exchange  
 Combined with Modification of  
 Terms 682

CONCEPTUAL EVALUATION OF  
 ACCOUNTING FOR TROUBLED  
 DEBT RESTRUCTURINGS 683  
 APPENDIX 2: SERIAL BONDS 683  
 RECORDING THE ISSUANCE AND  
 INTEREST EXPENSE OF SERIAL  
 BONDS 683  
 Example: Serial Bonds 684  
 EARLY REDEMPTION OF SERIAL  
 BONDS 686

#### **15 Investments 704**

INVESTMENTS: CLASSIFICATION  
 AND VALUATION 706  
 INVESTMENTS IN DEBT AND  
 EQUITY TRADING SECURITIES 708  
 INVESTMENTS IN AVAILABLE-FOR-  
 SALE DEBT AND EQUITY  
 SECURITIES 708  
 Recording Initial Cost 709  
 Recording Interest and Dividend  
 Revenue 709  
 Recognition of Unrealized Holding  
 Gains and Losses 710  
 Realized Gains and Losses on Sales

## OBJECTIVES

After reading this chapter, you will be able to:

- 1 Understand capital markets and decision making.
- 2 Know what is included in financial reporting.
- 3 Explain generally accepted accounting principles (GAAP) and the sources of GAAP.
- 4 Identify the types of pronouncements issued by the FASB.
- 5 Understand how the Financial Accounting Standards Board (FASB) operates.
- 6 Describe the relationship between the Securities and Exchange Commission (SEC) and the FASB.
- 7 Use ethical models for decision making about ethical dilemmas.
- 8 Understand creative and critical thinking.

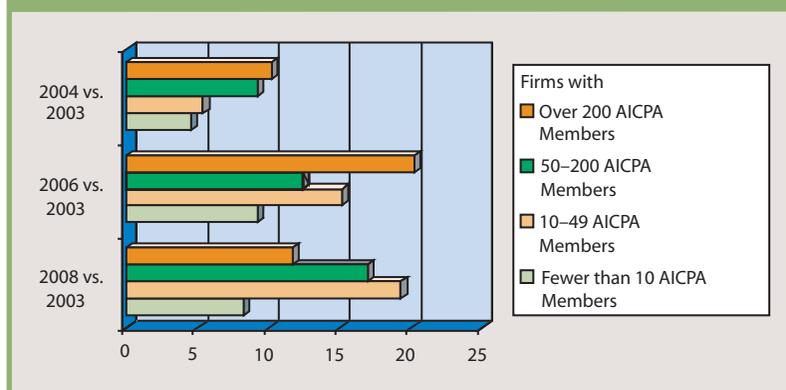

# The Environment of Financial Reporting

## The Future Is Bright!

With the accounting difficulties at **Enron**, **WorldCom**, **HealthSouth**, and others, the accounting profession has come under intense scrutiny from regulatory agencies and has become the subject of late-night talk show jokes. As a future accounting professional, a natural question is what the future holds for you upon graduation. Let's take a look at some recent evidence that may yield some answers.

As the regulatory environment has become more dynamic over the last several years, companies are faced with an increasing number of new accounting rules that pose a significant challenge for financial reporting. All indications are that future years will present even greater challenges. To deal with this changing environment, more and more companies are turning to accountants

Estimated Percentage Increase in Future Hiring

Source: Adapted from "The Supply of Accounting Graduates and the Demand for Public Accounting Recruits - 2004."

Credit: Stockbyte

for assistance. Many companies have increased the importance of accounting skills in their executive training programs while other companies have emphasized the certified public accountant (CPA) credential in their executive searches. The trend toward increased hiring of individuals possessing accounting skills is not confined to industry. According to the 2004 American Institute of Certified Public Accountants (AICPA) survey, hiring of accounting graduates by public accounting firms increased approximately 10% in 2003. Future projections of hiring trends for accounting graduates (shown in the figure) are indicative of continued positive growth.

Finally, in a recent survey conducted by the National Association of Colleges and Employers, accounting was listed as the number one major on college campuses. By all indications, accounting skills appear in high demand, and your future professional career in accounting appears bright!

### FOR FURTHER INVESTIGATION

For a discussion of the demand for accounting, consult the Business & Company Resource Center (BCRC) or the Internet for:

- CPA Ascendant. Kate O'Sullivan, *CFO, The Magazine for Senior Financial Executives*, 8756-7113, June 2004, v20, p102(2).
- American Institute of Certified Public Accountants. "The Supply of Accounting Graduates and the Demand for Public Accounting Recruits – 2004," <http://www.aicpa.org/members/div/career/edu/sagdpar.htm>.

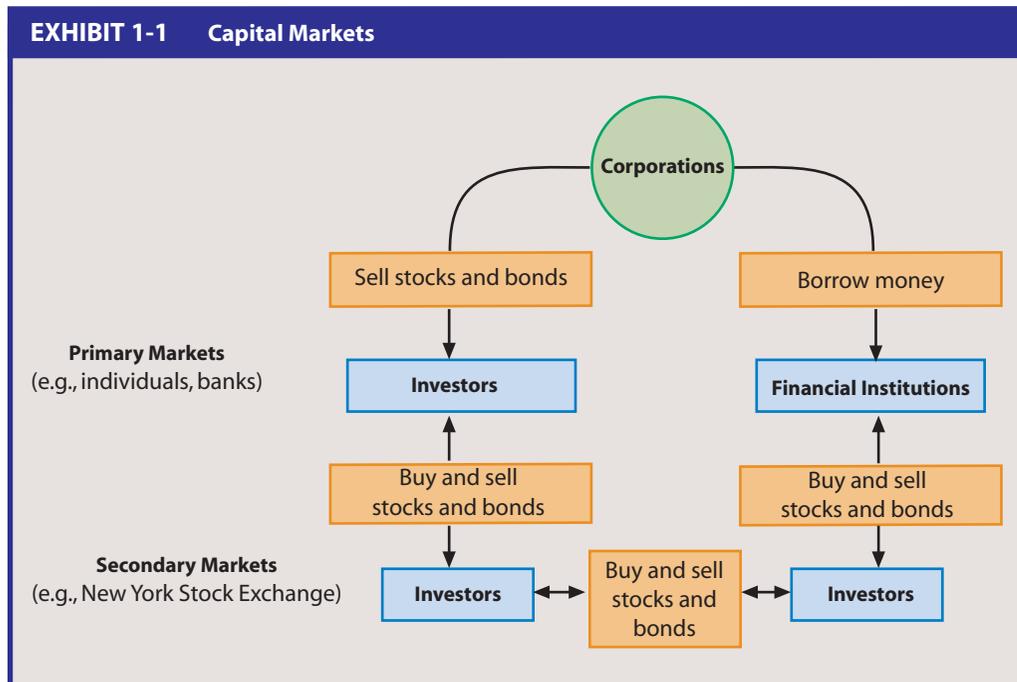

Accounting is the process of identifying, measuring, recording, and communicating economic information to enable users to make informed judgments and decisions. It is also called the “language of business.” In the U.S. economy, most published accounting information is about different types of companies (primarily corporations). Companies engage in many transactions and generate large amounts of data. Since people can absorb only limited amounts of information, accounting systems are designed to report information in a concise, understandable format. In this sense, accounting is the link between a company’s economic activities and decision makers.

In this chapter we review the uses of accounting information and who uses it, the development of principles for accumulating and communicating accounting information, and the ethical framework within which these accounting principles are applied.

## ACCOUNTING INFORMATION: USERS , USES, AND GAAP

The U.S. economy is a free-market economy. In this type of economy, the decisions of many buyers and sellers influence the demand for and supply of products and services offered by companies. Individuals acting in this economy have limited resources to consume or to invest. But typically companies need large amounts of capital for their operations. Companies may obtain this capital from the issuance of capital stock (equity) and bonds (debt), from other borrowings, or from resources generated by their operations. The exchange of capital by investors for the stocks and bonds of companies occurs in **capital markets**, as we show in Exhibit 1-1. There are organized capital markets, such as the New York Stock Exchange (NYSE), the American Stock Exchange (AMEX), and the Nasdaq Stock Market, Inc. (NASDAQ). In these markets the capital stock and bonds of many corporations are purchased and sold daily. These corporations are called *publicly-held* (or *publicly-traded*) companies. These markets sometimes are referred to as *secondary markets* because the sales and purchases are among the investors themselves. That is, the corporation that initially issued the capital stock or bonds is not involved in the exchange.

There also are more loosely organized capital markets in which fewer exchanges occur. For instance, corporations may borrow from lending institutions or may issue new

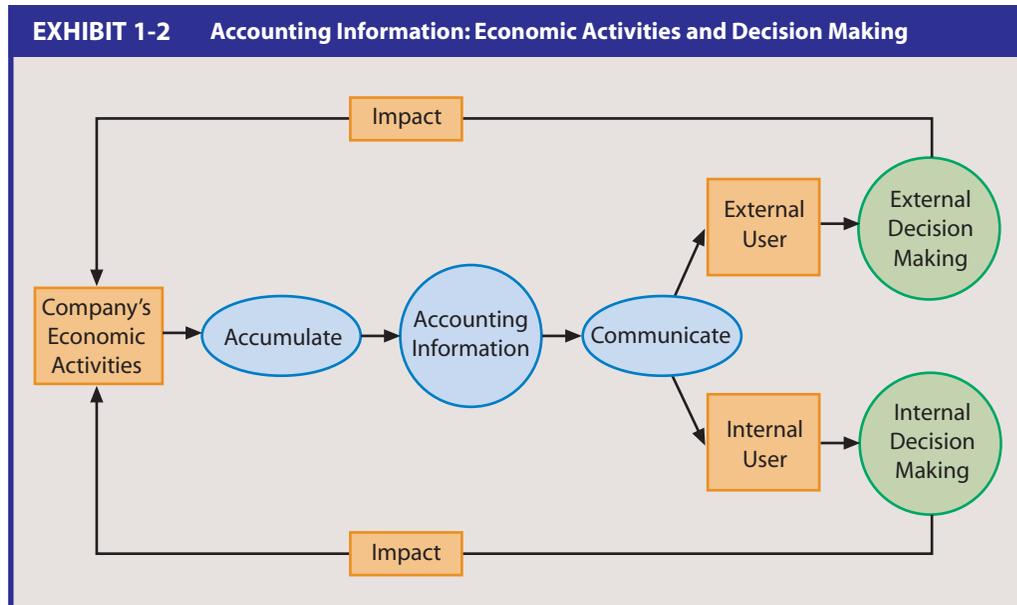

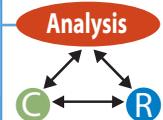

capital stock or bonds, either through “public offerings” or through “private placements.” Public offerings involve the sale to many investors (i.e., the general public). Private placements involve the sale to a few private institutions such as insurance companies and pension funds, or to employees. These markets sometimes are called *primary markets* because the exchange is directly between a corporation and the investors. Whether investors or lending institutions are involved in primary or secondary markets, they are interested in earning dividends and interest, and in a safe return of their resources. Investors in publicly traded securities participate in the increase (or decrease) in the market price of the capital stock and bonds. These investors are concerned with the efficient allocation of their scarce resources to achieve these objectives. Accounting information is useful in making decisions for this allocation process within these capital markets. It is also useful for other purposes.

## External and Internal Users

Users of accounting information can be divided into two major categories, external users and internal users, as we show in Exhibit 1-2. These two user groups do not have the same information needs because of their different relationships to the company providing the economic information. **External users are actual or potential investors (stockholders and bondholders) and creditors (such as suppliers and lending institutions).** There are also other external users, such as employees, financial analysts, advisers, brokers, underwriters, stock exchanges, taxing and regulatory authorities, labor unions, and the general public. (Note that bondholders are “creditors” by contract and legal definition, but are considered “investors” as this term is commonly used.) Investors have a direct relationship with the company. Their capital market information needs revolve around three basic decisions:

1. *Buy*. A potential investor decides to purchase a particular security (e.g., a stock or bond) based on communicated accounting information.
2. *Hold*. An actual investor decides to retain a particular security based on communicated accounting information.
3. *Sell*. An actual investor decides to sell a particular security based on communicated accounting information.

1 Understand capital markets and decision making.

Creditors, such as suppliers and lending institutions, also have a direct relationship with companies. Although creditors do not purchase securities, they make similar decisions that require accounting information. The decisions in this case are to extend credit, to maintain the credit relationship, or not to extend credit. Other users use accounting information in their decision making. For instance, stock exchanges use accounting information for listings, cancellations, and rule-making decisions. Labor unions use accounting information in negotiating wage agreements. Financial analysts use accounting information for making investment and credit recommendations.

Investment and credit decisions should be continuously reevaluated. Timely communication of information to external decision makers is very important. The publication of financial statements (e.g., in “hard copy” or on a company’s web site) is a primary method by which relevant information is communicated. Studies have shown, however, that decision makers also use other reporting sources to satisfy their information needs.<sup>1</sup> We discuss this area of study, known as efficient capital markets research, in Chapter 6.

**Internal users are the company managers who plan and control its operations on a day-by-day and a long-term basis.** Internal users may request any information that the accounting system is capable of providing to help them make decisions on internal operations. For example, internal users may ask for information relating specifically to the purchase of new equipment or the addition of a new product.

## Financial and Managerial Accounting Information Systems

Two branches of accounting are used to meet the needs of external and internal users. **Financial accounting is the information accumulation, processing, and communication system designed to provide investment and credit decision-making information for external users.** Financial accounting information is communicated (reported) through published financial statements and must follow the pronouncements of several policy-making groups. **Managerial accounting is the information accumulation, processing, and communication system designed to provide decision-making information for internal users.** Managerial accounting information is communicated via internal company reports and is not subject to the policy standards for externally communicated information. It is restricted by how useful the information is for a specific decision, and by the cost of providing that information. Financial and managerial accounting thus have somewhat different objectives because they provide information for different decisions. Exhibit 1-3 summarizes some of the more important differences.

The company’s accountants prepare both the financial accounting and the managerial accounting reports, and the information comes from the same information system. The differences lie in selecting and presenting the communicated information. This book focuses on financial accounting and its usefulness in investors’, creditors’, and other users’ decision making. We generally do not discuss managerial accounting information. On the other hand, the rules of a game influence how the game is played. The management of a company often is evaluated based on “performance criteria” (e.g., net income, rate of return) that are based on the accounting measures used in financial accounting reports. Thus, the financial accounting system may influence the managerial accounting system, or vice versa.

---

1. In addition to the use of published financial statements, accounting information may be communicated to external users by other methods, such as reports filed with the Securities and Exchange Commission (discussed later in the chapter), news releases, and management forecasts. Evidence from capital markets research studies tends to show that security prices fully reflect all *publicly* available information. For a more detailed discussion, see T. R. Dyckman and D. Morse, *Efficient Capital Markets and Accounting: A Critical Analysis*, 2nd ed. (Englewood Cliffs, N.J.: Prentice-Hall, 1986), R. L. Watts and J. R. Zimmerman, *Positive Accounting Theory* (Englewood Cliffs, N.J.: Prentice Hall, 1986), W. H. Beaver, *Financial Reporting: An Accounting Revolution*, 3rd ed. (Upper Saddle River, N.J.: Prentice Hall, 1998), or J. R. Macey, “Efficient Capital Markets, Corporate Disclosure, and Enron,” *Cornell Law Review* (January 2004), p. 394–403.

**EXHIBIT 1-3 Comparison of Financial and Managerial Accounting**

	<b>Financial Accounting</b>	<b>Managerial Accounting</b>
1. Source of authority	Generally accepted accounting principles (GAAP)	Internal needs
2. Time frame of reported information	Primarily historical	Primarily present and future
3. Scope	Mainly total company	Individual departments, divisions, and total company
4. Type of information	Primarily quantitative	Qualitative as well as quantitative
5. Statement format	Prescribed by GAAP; oriented toward investment and credit decisions	Determined by company; focused on specific decisions being made
6. Decision focus	External	Internal

In other words, the amounts reported or methods used for financial accounting may influence management decisions. Or, the management of a company (perhaps in its own self-interest) may use the managerial accounting system to influence financial reporting. In this regard, the term *agency theory* describes the relationship between the manager (the “agent”) and the stockholder (the “principal”). The theory suggests that agents do not always act in the best interests of the principals. For example, managers might make a decision that increases their compensation while reducing the wealth of the company and its stockholders. Research suggests that an effective way to align the interests of the agent and the principal is to base the manager’s compensation on the performance of the company. Examples include the payment of bonuses that are a percentage of the company’s income, and the awarding of stock options. We discuss bonuses and stock options in Chapters 13 and 16. In other chapters we discuss the effects on financial reporting from actual or potential agency theory relationships.

## Financial Reporting

**Financial reporting is the process of communicating financial accounting information about a company to external users.** A company may report its financial accounting information in several ways. One important way is through its *annual report*. The financial reporting section of a company’s annual report includes the company’s financial statements and the notes to the financial statements. Companies present at least three major financial statements: (1) the *balance sheet* (or statement of financial position), which shows a company’s financial position at a given date, (2) the *income statement*, which shows the results of a company’s income-producing activities for a period of time, and (3) the *statement of cash flows*, which shows a company’s cash inflows and cash outflows for a period of time. Many companies include the *statement of changes in stockholders’ equity*, which shows the changes in each item of stockholders’ equity for a period of time, as a fourth major financial statement.<sup>2</sup>

2. Some companies include a *statement of comprehensive income* as another major financial statement. We discuss this statement in Chapter 5.

**2** Know what is included in financial reporting.

The *notes* to the financial statements include discussions that further explain items shown in the financial statements. Many of these notes also include supporting schedules of computations (some companies include the statement of changes in stockholders' equity here). The information in the notes is essential to understanding a company's activities. Most financial statements and accompanying notes presented to external users are *audited* by an independent certified public accountant (CPA). As we discuss in Chapters 4 and 6, after completion of the audit, the CPA expresses an opinion as to the fairness, in accordance with *generally accepted accounting principles*, of the financial statements and accompanying notes. These financial statements and notes (and supporting schedules) to the financial statements are the subject of this book.

### SECURE YOUR KNOWLEDGE 1-1

- Accounting information aids in the efficient allocation of resources in capital markets.
- External users (investors, creditors, and others) use financial accounting information to make investment and credit decisions.
- Internal users (company management) use managerial accounting information to plan and control a company's operations.
- Financial reporting is the process of communicating financial information about a company to external users and includes the financial statements and the related notes to the financial statements.

### Generally Accepted Accounting Principles

The information communicated to external users in financial reporting is based on standards that establish generally accepted accounting principles (GAAP). **Generally accepted accounting principles are the guidelines, procedures, and practices that a company is required to use in recording and reporting the accounting information in its audited financial statements.** GAAP define accepted accounting practices and provide a standard by which to report financial results. They are like laws and are the rules that must be followed in financial reporting.

The evolution of GAAP took place over many years. It involved several accounting policy-making bodies, including the Financial Accounting Standards Board (FASB), Accounting Principles Board (APB), American Institute of Certified Public Accountants (AICPA), and Securities and Exchange Commission (SEC). Unfortunately, there is no single document that includes all the accounting standards. [There are electronic databases such as the FASB *Financial Accounting Research System (FARS)* that include most accounting standards.] Nonetheless, an accountant must be able to determine the procedure for recording a transaction that is acceptable under GAAP. Accountants, therefore, must know the sources of generally accepted accounting principles. They must also know how to find authoritative sources to aid in recording and reporting a particular transaction. Throughout this book we discuss GAAP for various transactions, events, and circumstances. However, to aid in researching the sources of generally accepted accounting principles, Exhibit 1-4 provides a "hierarchy" of four categories of GAAP and the authoritative sources applicable to each category for companies.<sup>3</sup>

These categories are listed in descending order of importance, with Category A as the most important. Companies must follow the GAAP established by the pronouncements

**3** Explain generally accepted accounting principles (GAAP) and the sources of GAAP.

3. See "The Hierarchy of Generally Accepted Accounting Principles," *Proposed FASB Statement of Financial Accounting Standards* (April 28, 2005). This document will move the GAAP hierarchy contained in *AICPA Statement on Auditing Standards No. 69* into the FASB literature. The Proposed Statement is not controversial, but the timing of its release is dependent on the issuance of similar documents by the PCAOB and AICPA. Until its release, the hierarchy (which is essentially identical to that in the Proposed Statement) listed in the *AICPA Statement No. 69* applies.

**EXHIBIT 1-4 Hierarchy of Sources of GAAP**

<b>Categories</b>	<b>Authoritative Sources (Pronouncements)</b>
<b>A</b>	<b>FASB <i>Statements of Financial Accounting Standards and Interpretations</i>, FASB <i>Staff Positions</i>, FASB <i>Statement 133 Implementation Issues</i>, APB <i>Opinions</i>, and CAP (AICPA) <i>Accounting Research Bulletins</i> (as well as SEC releases such as <i>Regulation S-X</i>, <i>Financial Reporting Releases</i>, and <i>Staff Accounting Bulletins</i> for companies that file with the SEC)</b>
<b>B</b>	<b>FASB <i>Technical Bulletins</i>, and, if cleared* by the FASB, AICPA <i>Industry Audit and Accounting Guides</i>, and AICPA <i>Statements of Position</i></b>
<b>C</b>	<b>FASB Emerging Issues Task Force <i>Consensus Positions</i> and, if cleared* by the FASB, AICPA <i>Practice Bulletins</i></b>
<b>D</b>	<b>FASB <i>Q's and A's</i> (Implementation Guides), AICPA <i>Accounting Interpretations</i>, AICPA <i>Industry and Audit Guides</i>, and AICPA <i>Statements of Position</i> not cleared by the FASB, and practices that are widely recognized and prevalent either generally or in the industry (e.g., AICPA <i>Accounting Trends and Techniques</i>)</b>

**\*"Cleared" means that the FASB does not object to the pronouncement's issuance.**

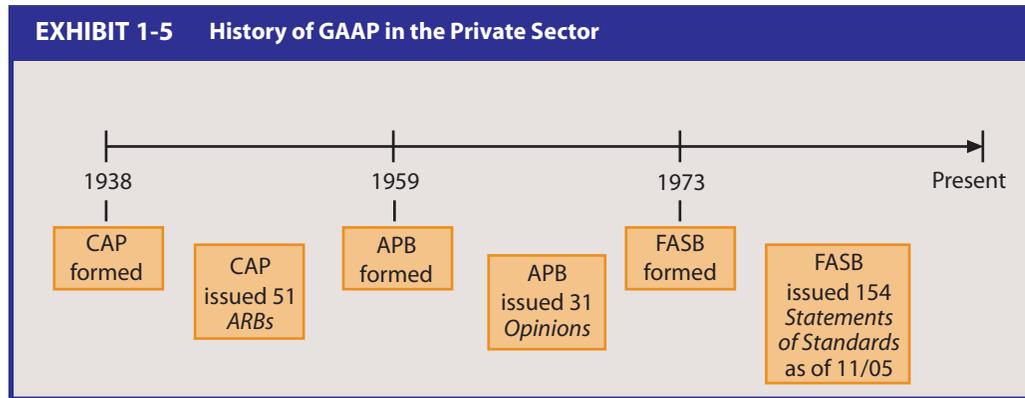

in this category unless, in unusual circumstances, they result in misleading financial statements. In situations where the accounting for a transaction or event is not specified by a pronouncement in Category A, then pronouncements in Categories B through D may be used in that order to identify GAAP. When none of the pronouncements in Categories A through D apply, then the company may consider other accounting literature such as FASB *Statements of Concepts*, AICPA *Issues Papers*, IASB *International Financial Reporting Standards*, AICPA *Technical Practice Aids*, and accounting textbooks, handbooks, and articles for GAAP guidance.

The FASB is currently working on a project that modifies the hierarchy so that it consists of only two levels—an “authoritative” level and a “nonauthoritative” level. The authoritative literature will be referred to as the “Codification.” This Codification will be a compilation of existing U.S. GAAP, organized according to accounting topics, regardless of the authoritative pronouncement. This Codification project will be a multi-year effort.

## THE ESTABLISHMENT OF ACCOUNTING STANDARDS

Accounting records dating back thousands of years have been discovered in various parts of the world. However, there was little organized effort to develop accounting standards in the United States prior to the 1930s. One of the most important initial attempts to develop standards began shortly after the onset of the Great Depression in 1929. In the early 1930s there were a series of meetings between representatives of the New York Stock Exchange and the American Institute of Accountants (later to become the American Institute of Certified Public Accountants). The goal was to discuss accounting and reporting issues involving the interests of investors, the New York Stock Exchange, and accountants.

The result of these meetings was a form of the auditor's opinion similar to the one used today. Specifically, the concepts of *fairness* and *consistency* in applying accounting principles were introduced into the auditor's opinion. Here, fairness means that the accounting methods and procedures adopted by a company comply with traditional practice and that they adequately portray the economic reality of the company. Since these meetings, several groups have been responsible for setting generally accepted accounting principles in the private sector of the United States. Exhibit 1-5 shows a “time-line” of the establishment of GAAP (Category A of Exhibit 1-4) in the private sector.

### Committee on Accounting Procedure (CAP)

In 1938, the AICPA formed the **Committee on Accounting Procedure (CAP)**. This group issued pronouncements to narrow the differences in accounting procedures and practice. Its conclusions were published as **Accounting Research Bulletins (ARBs)**. However, because at that time the AICPA did not have the authority to require compliance, the CAP could not enforce its pronouncements and their application was optional. By 1953, the CAP had issued 42 *Accounting Research Bulletins*. It then reviewed these pronouncements and codified them into **Accounting Research Bulletin No. 43**. The CAP issued eight more *Accounting Research Bulletins*, ending with No. 51 before it was replaced by the Accounting Principles Board in 1959. All *Accounting Research Bulletins* are now sources of generally accepted accounting principles unless specifically superseded or amended.

### Accounting Principles Board (APB)

After World War II the process of setting accounting principles was increasingly criticized and wider representation in rule making was sought. In 1959 the AICPA formed the **Accounting Principles Board (APB)** as an attempt to (1) alleviate this criticism and (2) create a policy-making body whose rules would be binding on companies rather than optional. The APB had between 17 and 21 members, selected primarily from the accounting profession. Representatives from industry, the government, and academia also served on the Board. The pronouncements of the APB were called **Opinions of the Accounting Principles Board**, and 31 of these Opinions were issued. *APB Opinions* are sources of generally accepted accounting principles unless specifically amended or rescinded. Some of these Opinions were based upon *Accounting Research Studies*. However, the conclusions in these studies were the opinion of the individuals commissioned by the APB to write them. In several cases the APB either did not act on the recommendations or came to different conclusions.

The members of the APB were volunteers whose employers allowed them time to serve on the Board. But by the late 1960s, many people again criticized the development of accounting principles. This criticism centered on three factors:

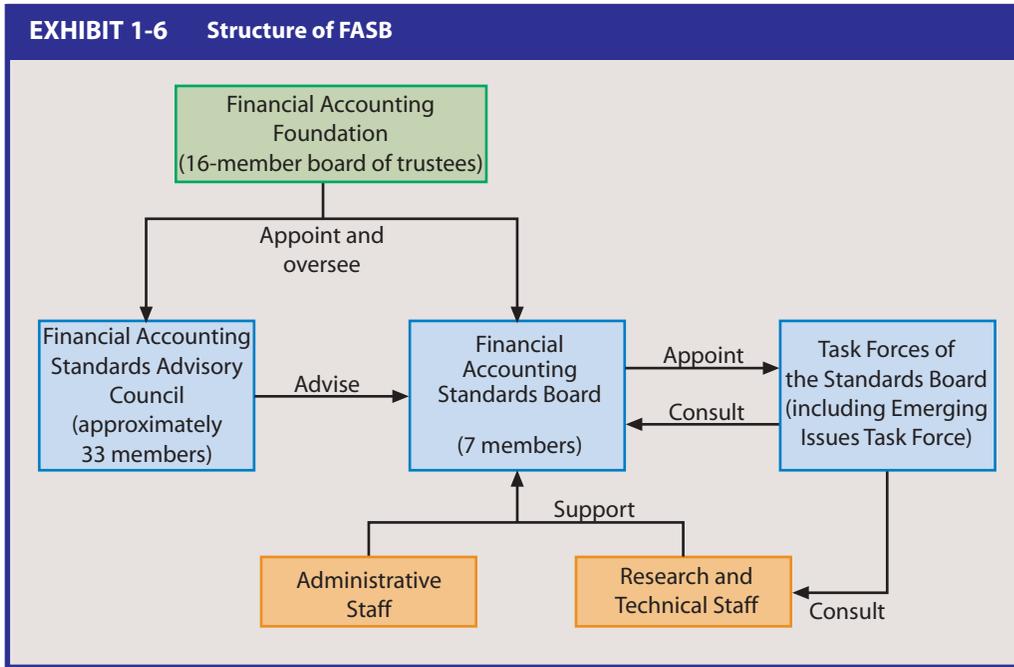

1. *Independence*. The members of the APB were part-time volunteers whose major responsibilities were to the business, governmental, or academic organizations employing them.
2. *Representation*. The public accounting firms and the AICPA were too closely associated with the development of accounting standards.
3. *Response time*. Emerging problems were not solved quickly enough by the part-time members of the APB.

The AICPA reacted to those criticisms by appointing a committee to evaluate the method of establishing accounting principles. This committee, called the Wheat Committee after

its chairman Francis Wheat, recommended that the APB be abolished and that a new full-time body be created with even wider representation.

### Financial Accounting Standards Board (FASB)

The AICPA adopted the recommendations of the Wheat Committee. The APB was phased out and replaced in 1973 by the **Financial Accounting Standards Board (FASB)**. Exhibit 1-6 shows the current structure of the FASB.

### Organization

The Financial Accounting Foundation is the parent organization of the FASB. It is governed by a 16-member Board of Trustees appointed from the memberships of eight organizations interested in the establishment of accounting principles. These organizations are the AICPA, Financial Executives International, Institute of Management Accountants, CFA Institute, American Accounting Association, Securities Industry Association, Government Finance Officers Association, and National Association of State Auditors (Comptrollers and Treasurers).<sup>4</sup> The primary responsibilities of the Financial Accounting Foundation are to provide general oversight to its operations and to appoint the members of the Financial Accounting Standards Advisory Council (FASAC) and the FASB. The FASAC has about 33 influential members. It is responsible for advising the FASB about major policy issues, the priority of topics, the selection of task forces, the suitability of tentative decisions, and other matters.

There are seven members of the FASB. Appointees to the FASB are full-time, fully paid members with no other organizational ties. They are selected to represent a wide cross-section of interests. Each Board member is required to have a knowledge of accounting, finance, and business; high intelligence, integrity, and discipline; and a concern for the

4. The Financial Accounting Foundation also is the parent organization of the Governmental Accounting Standards Board (GASB), which establishes accounting principles for state and local governmental entities. We briefly discuss the GASB later in the chapter.

public interest regarding financial reporting. Currently, the FASB includes four members who are CPAs and who have been in public practice and three members from other areas related to accounting (e.g., academia and industry). The FASB is responsible for identifying financial accounting issues, conducting research to address these issues, and resolving them. The FASB is supported by a research and technical staff that researches issues, communicates with constituents, and drafts preliminary findings. The administrative staff assists the FASB by handling library, publications, personnel, and other activities.<sup>5</sup>

The FASB issues several types of pronouncements:

**4** Identify the types of pronouncements issued by the FASB.

1. *Statements of Financial Accounting Standards*. These pronouncements establish generally accepted accounting principles. They indicate the methods and procedures required on specific accounting issues and are included in Category A of Exhibit 1-4.
2. *Interpretations*. These pronouncements provide clarification of conflicting or unclear issues relating to previously issued *FASB Statements of Financial Accounting Standards*, *APB Opinions*, or *Accounting Research Bulletins*. Interpretations also establish or clarify generally accepted accounting principles. They are included in Category A of Exhibit 1-4.
3. *Staff Positions*. The staff of the FASB issues these pronouncements to provide more timely and consistent application guidance in regard to FASB literature. In addition, at the direction of the FASB, the staff may issue *Staff Positions* to make narrow and limited revisions of *FASB Statements of Financial Accounting Standards* or *Interpretations* that previously would have been made through *Technical Bulletins*. They are included in Category A of Exhibit 1-4.
4. *Technical Bulletins*. The staff of the FASB issues these pronouncements to provide guidance on accounting and reporting problems related to *Statements of Financial Accounting Standards* or *Interpretations*. The guidance may clarify, explain, or elaborate upon an underlying standard. They are included in Category B of Exhibit 1-4.
5. *Statements of Financial Accounting Concepts*. These pronouncements establish a theoretical foundation on which to base financial accounting and reporting standards. They are the output of the FASB's "Conceptual Framework" project (which we discuss in Chapter 2).<sup>6</sup> They are not included in Exhibit 1-4 but are considered "other accounting literature" for GAAP guidance.
6. *Other Pronouncements*. On a major topic, the FASB staff also may issue a *Guide for Implementation*, which is in the form of questions and answers (referred to as *FASB Q's and A's*). These are included in Category D of Exhibit 1-4.

Many of these documents may be downloaded for free from the FASB web site (<http://www.fasb.org>) or may be purchased individually from the FASB. As a service to its constituency, the FASB also offers other publications. Two of these, published each year as part of the FASB's *Accounting Standards* series, are useful references for accountants. One three-volume set, titled *Original Pronouncements*, includes all of the first four types of pronouncements as of its date of publication. Another two-volume set, titled *Current Text (General Standards and Industry Standards)*, is a topical integration of currently effective accounting and reporting standards as of its date of publication. These documents are also available on the *FARS* electronic database.

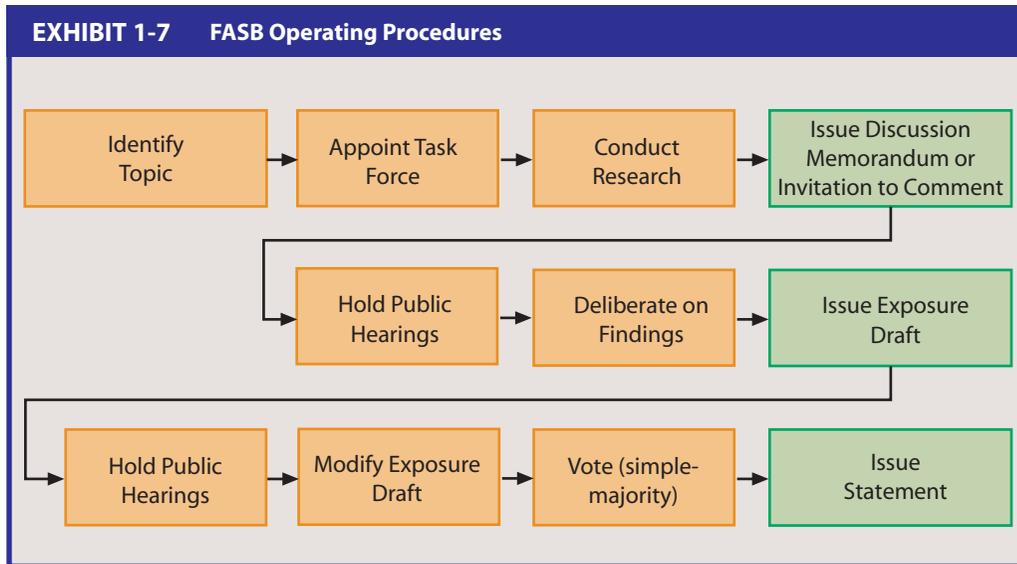

5. For a more detailed look at the FASB's operations, see P. B. Miller, R. J. Redding, and P. R. Bahnson, *The FASB: The People, the Process, and the Politics*, 4th ed. (Boston: The McGraw-Hill Companies, Inc., 1998).

6. The similarity in the titles *Statement of Financial Accounting Concepts* and *Statement of Financial Accounting Standards* makes an abbreviated reference to each potentially ambiguous. To avoid confusion, throughout this book a reference to **FASB Statement No. \_\_\_** in the body of the text will always refer to a statement of *standards*, while a full reference will be presented for each statement of *concepts*.

**Operating Procedures**

Before issuing a statement of concepts or standards, the FASB generally completes a multi-stage process as outlined in Exhibit 1-7. Initially, a topic or project is identified and placed on the FASB’s agenda. This topic may be the result of suggestions from the FASAC, the accounting profession, industry, or other interested parties. On major issues a Task Force may be appointed to advise and consult with the FASB’s Research and Technical Staff. This may involve, for instance, the scope of the project and the nature and extent of additional research. The Staff conducts any research specifically related to the project.

5 Understand how the Financial Accounting Standards Board (FASB) operates.

Then the FASB usually publishes a Discussion Memorandum or Invitation to Comment (which outlines the research related to the issues) and sets a public comment period. During this period, the FASB may hold public hearings similar to those conducted by Congress. The intent is to receive information from and views of interested individuals and organizations on the issues. Many parties submit written comments (“position papers”) or make oral presentations. These parties include representatives of CPA firms and interested corporations, security analysts, members of professional accounting associations, and academics. After deliberating on the views expressed and the information collected, the FASB issues an Exposure Draft of the proposed Statement. Interested parties generally have 30 to 90 days to provide written comments of reaction. On major issues, the FASB may hold more public hearings. Sometimes, the FASB conducts “field tests” of the proposed standards with selected companies to evaluate implementation issues. A modified draft is prepared, if necessary, and brought to the FASB for a final vote. After a *simple-majority* (i.e., 4 to 3) vote is attained, the *Statement* is issued.

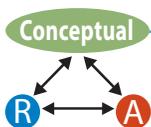

The time involved to complete each of the steps varies depending on the complexity of the topic. For some complex topics it takes several years; for other, less complex topics only a few months are needed. For instance, the FASB deliberated on basic conceptual and practical issues involving the statement of cash flows for more than 10 years. The board issued a Discussion Memorandum in 1980, but then deferred consideration of cash flows reporting until it dealt with related theoretical issues in its Conceptual Framework project. In 1985 the FASB reactivated the topic. It held public hearings and received more than 450 comment letters in response to its Exposure Draft. *FASB Statement No. 95*, entitled “Statement of Cash Flows,” was issued in November 1987, as shown in the following summary.

Step in Procedures	FASB Statement No. 95	FASB Statement No. 145
Issue <i>Discussion Memorandum</i>	Dec. 1980	None
Receive public comments	May 1981	None
Appoint Task Force	May 1985	None
Issue <i>Exposure Draft</i>	July 1986	Nov. 2001
Receive public comments	Through Mar. 1987	Through Jan. 14, 2002
Issue <i>Statement</i>	Nov. 1987	April 2002

On the other hand, *FASB Statement No. 145*, which rescinded *FASB Statement No. 4* in regard to reporting gains and losses from the extinguishment of debt, was issued within eight months after the related *Exposure Draft* was issued. In this case the FASB concluded that it could reach an informed decision without a public hearing. During the public comment period it did receive 30 comment letters, which were used in the deliberation process.

### Sociopolitical Environment

As Exhibit 1-7 and the related discussion show, the operating procedures of the FASB are designed so that accounting standards are developed in an efficient manner, with due process, and in a public forum. The FASB is concerned that it considers all related research on a particular topic, as well as the views of all interested parties, before coming to a logical conclusion about the appropriate accounting standard for the topic. Its intent is to develop accounting standards that provide users with thorough, neutral, and credible information to help allocate capital as efficiently as possible.<sup>7</sup>

An inexperienced viewer of the FASB operating procedures might think that accounting standards are always “ideal” because they are the result of “rational policy making,” where there are clearly defined objectives, an integrated body of theory, and known consequences of the actions. Yet this may not always be the case because accounting is part of a broader social system. Often, objectives are not clear, research results are conflicting, and only “best guesses” can be made of the future consequences of current standards.

Because the FASB has such a wide constituency and focuses on general purpose financial reporting, it often must establish accounting standards that are the result of *compromise*. To achieve “acceptable decisions” it is only natural for any affected parties to attempt to influence the FASB’s decisions. Since the FASB holds public hearings and open meetings, it is relatively easy for various external user groups (e.g., investors and creditors) and other interested groups (e.g., affected corporations and CPA firms) to try to influence the FASB to develop new standards, continue existing standards, or change existing standards in their own best interests. These groups often hold conflicting views. For instance, in 1995 the FASB decided that a new accounting standard for “stock options” was desirable, but it could not get enough support from external user groups. Therefore, it issued a standard that allowed companies to use either the new standard or the existing standard. In this case, compromise led to a lack of “comparability” across companies as to the effect of stock option accounting on their financial statements. The serious financial reporting failures (e.g., Enron) that occurred in the early 2000s led to a review of this accounting. As a result, the FASB (despite opposition from some members of Congress) issued a new standard *requiring* the use of one method to account for stock options.

Compromise is inevitable as the FASB responds to the “globalization” of industry. In this regard, the FASB has been working with the International Accounting Standards Board (discussed later) and the accounting rule-making bodies of other countries to “harmonize” accounting standards among different countries. As Dennis Beresford (former Chair of the FASB) states: “Different countries have different domestic concerns that

7. J. M. Foster, “The FASB and Capital Markets,” *The FASB Report No. 245* (June 30, 2003). p. 3.

Credit: ©Getty Images/PhotoDisc

are reflected in the way they think about financial reporting. None of the viewpoints are more 'right' than one another, just different. Compromises are an inevitable part of harmonization."<sup>8</sup>

In regard to U.S. standards, for a given topic each FASB member will have certain issues of high priority and others of lower priority. In the FASB's deliberation process each Board member will attempt to persuade the other members to accept the important issues and to drop the less important ones. This negotiation is necessary to reach a consensus so that a majority vote may be attained on the topic.<sup>9</sup> Whenever a compromise is reached, some in the FASB's constituency may be unhappy because they perceive that the new GAAP is somehow "unfair" to them. In such a situation, many in the constituency have criticized the FASB for failing to listen to them, not considering the cost/benefit issues, creating logically inconsistent rules, and establishing complex standards that are too hard to implement. To help overcome these criticisms, the FASB now includes a discussion of its reasoning in each pronouncement it issues.

The Financial Accounting Foundation, in overseeing the FASB, has implemented procedures to overcome these criticisms. These procedures include use of an oversight committee to monitor the FASB's standard-setting process, periodic Financial Accounting Foundation and FASB discussions, stronger input by the FASAC on agenda determination and task force use, and additional publication and field testing of preliminary views. Furthermore, it is considering moving toward "objectives-oriented" rather than "rule-based" accounting standards, which we will discuss in Chapter 2.

Accounting standards are not unchangeable. The FASB fulfills its responsibility by (1) establishing standards that are the most acceptable, given the various affected constituencies, and (2) continually monitoring the consequences of its actions so that revised standards can be issued where appropriate. As Beresford points out, the FASB carries out its public responsibility in an environment characterized by subtlety, complexity, and an absence of clear-cut answers. The FASB works hard to develop accounting standards that can

8. D. R. Beresford, "Notes from the Chairman," *FASB Status Report No. 282* (November 18, 1996), p. 2.

9. For additional discussion of the FASB's political process, see Miller, Redding, and Bahnson, *op. cit.*, chap. 1.

be defended in terms of facts and circumstances, logic, and the fairness of the process that produces them. Reinforcing this fairness idea in testimony before Congress, Robert Herz (Chair of the FASB) stated that neutrality is a fundamental element of the FASB's standard-setting process. The Board strongly opposes any legislation that would impair its independent, objective, and open standard-setting process.<sup>10</sup>

### Objectives-Oriented Standard Setting

As we noted in the preceding section, many constituents have said that they are concerned about the increasing level of detail ("rules-based" approach), lack of consistency, and complexity in the standards set by the FASB. As a result, the Board has begun a process whereby in the future, standards will be based on an internally consistent conceptual framework (we discuss the current conceptual framework in Chapter 2). Each "objectives-oriented" standard would: (1) clearly state the accounting objective of the standard, (2) provide enough (but not too much) detail so that the standard could be applied on a consistent basis, and (3) minimize exceptions to the standard. The intent is to allow preparers and auditors to exercise professional judgment in determining how to apply accounting standards to show the economic substance of transactions and events. It is likely that this process will take several years because, among other things, preparers and auditors have become less willing to exercise professional judgments due to increasing litigation risks.<sup>11</sup>

### Other Organizations Currently Influencing Generally Accepted Accounting Principles

Several other organizations have had an impact on the development of generally accepted accounting principles during the past several decades.

#### Securities and Exchange Commission (SEC)

The SEC was created by Congress to administer the Securities Act of 1933 and the Securities Exchange Act of 1934. Under these Acts, **the SEC has the legal authority to prescribe accounting principles and reporting practices for all corporations issuing publicly traded securities.** About 17,000 (less than 1%) of the 4.9 million corporations in the United States are subject to the SEC's authority. Although this percentage is small, these corporations (e.g., Wal-Mart) are the major companies in our economy. While the SEC has seldom used this authority, from time to time the SEC has exerted pressure on the CAP, the APB, and the FASB. It has been especially interested in narrowing differences in accounting practice and in increasing disclosures.

The 1933 Act requires each company offering securities for sale to the public in the primary and secondary markets to file a registration statement. It also requires these "publicly-held" companies to provide each investor with a proxy statement prior to each stockholders' meeting. The 1934 Act established extensive reporting requirements to aid in full disclosure. Among the most commonly required reports are:

*Form S-1.* A registration statement.

*Form 10-K.* An annual report.

*Form 10-Q.* A quarterly report of operations.

*Form 8-K.* A report used to describe any significant events that may affect the company.

*Proxy Statement.* A report used when management requests the right to vote through proxies for shareholders at stockholders' meetings.

10. R. H. Herz, "FASB Chairman Appears before Congress on Stock Option Accounting," *The FASB Report No. 245* (June 30, 2003), p. 11.

11. For a more complete summary of the FASB's activities on objectives-oriented standards, see "On the Road to an Objectives-Oriented Accounting System," *The FASB Report No. 259* (August 31, 2004), pp. 1–7.

Companies are required to file these forms electronically with the SEC. These forms are located in the SEC's Electronic Data Gathering Analysis and Retrieval System (commonly known as EDGAR) on the Internet (<http://www.sec.gov/edgar.shtml>).

The SEC establishes accounting principles with respect to the information contained within the preceding reports. It issues reporting guidelines in its *Regulation S-X*, its *Financial Reporting Releases*, and its *Staff Accounting Bulletins* for companies that file with the SEC. In some instances the SEC has required the disclosure of information not typically found in published financial reports. We discuss these disclosures further in Chapters 4 and 6.

The impact of the SEC generally has been through its informal approval of *APB Opinions* and *FASB Statements* before their issuance. While the SEC has the authority to decide what constitutes "generally accepted accounting principles," in many cases it has exercised this authority through persuasion rather than edict. The SEC has endorsed the concept of "substantial authoritative support" by asserting that "principles, standards, and practices promulgated by the FASB in its *Statements* and *Interpretations* will be considered by the Commission as having substantial authoritative support, and those contrary to such FASB promulgations will be considered to have no such support."<sup>12</sup> The result of this position has been to *allow accounting principles to be formulated in the private sector* rather than by the government.

However, the SEC has been criticized for not exercising its responsibility, and there is no assurance that this position will remain in effect. In fact, during 1978 the SEC refused to support **FASB Statement No. 19** requiring the use of the successful-efforts method in the oil and gas industry, and the FASB reacted by suspending the effective date of this release. Then, in the late 1980s the House Energy and Commerce Committee's Oversight and Investigations Subcommittee was critical of the SEC for its alleged failure to monitor the detection of fraud and to establish an "early warning" system for identifying potential business failures. Although these hearings did not result in changes involving the establishment of generally accepted accounting principles, they did have an impact on *auditing* standards. Furthermore, the SEC pressured the FASB to adopt a standard requiring the use of market values by companies for reporting certain types of investments, and the Board issued **FASB Statement No. 115** in response to this pressure.

### American Institute of Certified Public Accountants (AICPA)

The AICPA dates back to 1887 and is the professional organization for all certified public accountants in the United States. To be a member of the AICPA, an individual must have passed the Uniform CPA Examination, hold a CPA certificate, agree to abide by its bylaws and Code of Professional Ethics, and have 150 hours of higher education. The primary purpose of the AICPA is to provide the necessary technical support to assure that CPAs serve the public interest in performing quality professional services.

To fulfill this purpose, the AICPA publishes numerous documents that, in certain circumstances, may be considered as sources of generally accepted accounting principles, as listed in Exhibit 1-4. *Industry Audit Guides* and *Industry Accounting Guides* (Category B of Exhibit 1-4) are publications designed to assist independent auditors in examining and reporting on financial statements of various types of entities in specialized industries (e.g., banking). *Statements of Position* (Category B of Exhibit 1-4) are publications intended to influence the development of financial accounting principles that best serve the public interest. *Practice Bulletins* (Category C of Exhibit 1-4) are publications that provide guidance on specific technical issues.

During the tenure of the Accounting Principles Board, the AICPA issued numerous *AICPA Accounting Interpretations* to provide timely guidance on accounting issues without

**6** Describe the relationship between the SEC and the FASB.

12. "Codification of Financial Reporting Policies," *SEC Accounting Rules* (Chicago: Commerce Clearing House, 2005), sec. 101. This Codification contains the accounting principles and reporting guidelines issued prior to 1982 in the SEC's *Accounting Series Releases*. In 1982, the name was changed to *Financial Reporting Releases* to better reflect the nature of the documents.

the formal procedures needed for an APB *Opinion*. These *Interpretations* (Category D of Exhibit 1-4) are still sources of generally accepted accounting principles unless specifically rescinded or amended. The AICPA also annually publishes *Accounting Trends and Techniques* (Category D of Exhibit 1-4), which provides a study of the latest accounting practices and trends identified from a survey of 600 published annual reports. This publication may be used to identify a consensus about generally accepted accounting principles for a particular issue or methods of disclosure. In this book we often cite disclosure information from *Accounting Trends and Techniques* that applies to a specific accounting practice. Finally, the AICPA develops *Issue Papers* to help the FASB identify accounting areas that need to be addressed and clarified.

### **FASB Emerging Issues Task Force (EITF)**

The EITF was established in 1984 as a response by the FASB to criticisms that the Board did not always provide timely guidance on new accounting issues. Members of the EITF meet every six weeks; they include technical experts from all the major CPA firms and representatives from smaller CPA firms and from industry. These individuals are knowledgeable in accounting and financial reporting and are in positions to be aware of emerging problems. The Chief Accountant of the SEC also participates in EITF meetings. The primary objectives of the EITF are (1) to identify significant emerging accounting issues (i.e., unique transactions and accounting problems) that it feels the FASB should address and (2) to develop *consensus positions* on the implementation issues involving the application of standards. As shown in Category C of Exhibit 1-4, in some cases these consensus positions may be viewed as the “best available guidance” on generally accepted accounting principles, particularly as they relate to new accounting issues. The FASB publishes a summary of the proceedings of the EITF in a loose-leaf service and in an annual bound version titled *EITF Abstracts*. The summary is also available electronically on the FASB web site and the *FARS* database.

### **Cost Accounting Standards Board (CASB)**

The CASB was established in 1970 as an agency of the U.S. Congress. In 1980, Congress did not vote funds for its continuance, but it was reinstated in 1988. The CASB is responsible only for negotiated federal contracts and subcontracts exceeding \$500,000 and has issued several related *Cost Accounting Standards*. Since internal cost accounting procedures often affect externally reported financial information, these cost accounting standards occasionally influence external reporting. In the past, Congress considered replacing the FASB with a governmental board like the CASB. Although this change has not been made, the possibility of additional governmental involvement in setting accounting principles should not be discounted.

### **Internal Revenue Service (IRS)**

The IRS administers the Internal Revenue Code enacted by Congress. Federal income tax laws have had a significant impact on financial reporting practices since they were first enacted in 1913. Although the Internal Revenue Code generally does not affect financial accounting practice directly, managers often prefer to lessen its impact on the accounting systems within their companies. The result in many cases has been that they have used accounting methods and procedures that result in the lowest taxable income, without considering the proper financial accounting theory and practice.

You should understand that accounting for income tax purposes and accounting for financial reporting purposes *are* and *should be* different. The goal of financial accounting is to provide information to financial statement users so that they may make decisions. The goal of income tax accounting is to legally minimize or postpone the payment of income taxes. Frequently, the goals of financial reporting and income tax reporting conflict. For this reason, in this book we are concerned with determining the proper *financial* accounting recording and reporting procedures. What is, or should be, proper under the

Internal Revenue Code is an entirely different question, which we only discuss when it has an impact on financial accounting and reporting. We discuss the impact of the Internal Revenue Code on financial accounting for income taxes in Chapter 19.

### **American Accounting Association (AAA)**

The AAA is an organization primarily of academics and practicing accountants. The mission of the AAA is to foster worldwide excellence in the creation, dissemination, and application of accounting knowledge and skills. Its goals are to encourage excellence in accounting research and accounting instruction, and to contribute to excellence in accounting practice. These goals are primarily implemented through various meetings; the AAA's journals—*The Accounting Review*, *Issues in Accounting Education*, and *Accounting Horizons*; and the work of various committees such as the AAA Financial Accounting Standards Committee (FAS). The FAS responds to various documents of the FASB relating to proposed statements of concepts and standards. The AAA has no official stature in the development of financial accounting practice, so its impact is through education and persuasion. However, its members have served on the APB, FAF, and the FASB, and have appeared before the FASB in its hearings on particular issues.

### **International Accounting Standards Board (IASB)**

Companies are becoming more international in their operations by producing, selling, and buying products and services in other countries. This globalization of business activity has led to increased information in a company's financial statements about its international operations. Investors and creditors in international markets, in turn, prefer that the information they use for decisions be internationally comparable from company to company across countries. The International Accounting Standards Committee (IASC) foundation is the parent organization of the International Accounting Standards Board (IASB). The objectives of the foundation are to: (1) develop high-quality, understandable, and enforceable global accounting standards that lead to useful, comparable financial reporting to help users in the world's capital markets make informed economic decisions, (2) promote the use and rigorous application of these standards, and (3) bring national accounting standards into agreement with international accounting standards.

The operating structure of the IASC Foundation consists of (1) a group of *Trustees* that is responsible for fund-raising, appointing IASB members, and overseeing the effectiveness of the IASB, (2) the *IASB*, which issues *International Financial Reporting Standards* and includes 12 full-time members (and 2 part-time members) from various countries, (3) an *International Financial Reporting Interpretations Committee* to interpret the application of the Standards, and (4) a *Standards Advisory Council* to give advice to the IASB on priorities and views of organizations on major standard setting projects. The operating procedure of the IASB is somewhat similar to that of the FASB and includes study of the topic, issuance of an Exposure Draft, evaluation of comments, and consideration of a revised draft. If approved by at least eight members of the IASB, the revised draft becomes an *International Financial Reporting Standard*. To date, the IASB (and its predecessor, the International Accounting Standards Committee) have issued 48 Standards.

There are, however, important differences between the environments in which the FASB and the IASB operate. The FASB operates as a private standard-setting organization, and focuses on setting accounting standards in the United States to improve the usefulness of accounting information to investors and creditors. On the other hand, in many other countries the emphasis in financial reporting is on meeting legal (e.g., tax) requirements, so that standard setting has evolved as a governmental rather than a private function. A role of the IASB, then, is to consolidate many countries' accounting regulations into international standards. In this regard, in response to an appeal from the International Organization of Securities Commissions, the IASB has developed a set of "core standards" of accounting principles for the financial statements of companies making "crossborder" offerings of their securities. As a result, the European Commission requires that listed European companies must

use international accounting standards. Although there are areas of difference, financial statements prepared according to U.S. generally accepted accounting principles usually will comply with international accounting standards. Furthermore, as we noted earlier, the FASB and IASB are working together to harmonize accounting standards. However, financial statements prepared according to international accounting standards may *not* comply with U.S. GAAP. In later chapters, where U.S. accounting principles differ from international principles, we will discuss those differences briefly as they relate to the topics being covered.

### **Governmental Accounting Standards Board (GASB)**

The GASB was established in 1984 and operates under the auspices of the Financial Accounting Foundation. The GASB operates in a manner similar to the FASB. It consists of a full-time chair and six other members, plus a supporting staff. The GASB's responsibility is to establish financial accounting standards for certain state and local governmental entities. Its impact on accounting principles for the private sector is minimal.

### **Public Company Accounting Oversight Board (PCAOB)**

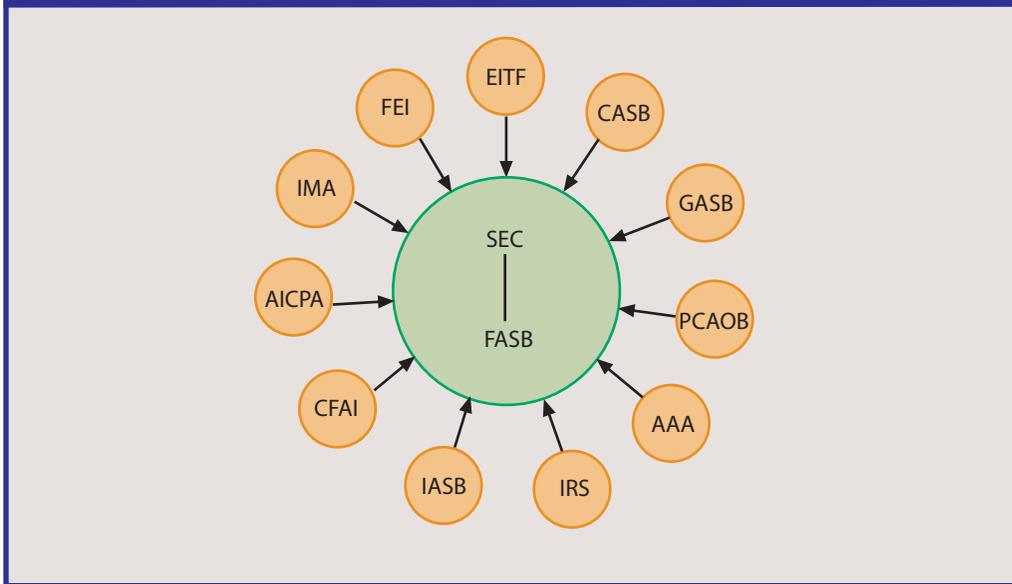

The PCAOB is a non-profit corporation that was created by Congress in the Sarbanes-Oxley Act of 2002. This was in response to fraudulent or misleading accounting practices by companies such as Enron and WorldCom. The PCAOB does not set generally accepted accounting principles. However, it indirectly influences public financial statements issued using GAAP. Its purpose is to protect the interests of investors by overseeing auditors of public companies in the preparation of informative, accurate, and independent audit reports for companies that sell securities to the public. The Board's responsibilities include registering public auditing firms; establishing auditing, quality control, and ethics standards; promoting high professional standards and improving the quality of audit services; and enforcing compliance with the securities laws as they relate to the preparation and issuance of audit reports. Any standards that the PCAOB proposes must be approved by the SEC.

### **Professional Associations**

There are also several professional organizations that play an important role in the accounting standard-setting process. The **Financial Executives International (FEI)** consists primarily of high-level financial executives (such as financial vice presidents, treasurers, and controllers) of major corporations. The FEI publishes a monthly journal called the *Financial Executive* and has sponsored research projects dealing with financial reporting issues. Membership in the **Institute of Management Accountants (IMA)** is open to anyone, although its primary focus is on management accounting and financial management issues. The IMA publishes a monthly journal called *Strategic Finance*, which includes articles involving strategies in accounting, finance, and information management. Members of the **CFA Institute (CFAI)** are financial analysts who use accounting information in various investment management and security analysis decisions. The CFAI publishes the *Financial Analysts Journal*, and its members participate in FASB research studies that deal with the impact of proposed accounting standards on users of financial accounting information. As we noted earlier, each of these organizations is also a member of the Financial Accounting Foundation. They provide input to the FASB through position papers and oral presentations in the public hearings process.

### **Relationship of Organizations in Current Standard-Setting Environment**

As we discussed earlier, accounting standards are set in a sociopolitical environment. Currently there are three major organizations in the private and public sector that develop GAAP for companies: the FASB, the AICPA, and the SEC. To a lesser extent, the other organizations we discussed in this section also are influential in the standard-setting process. We illustrate the relationship of the various participants in this process in Exhibit 1-8.

**EXHIBIT 1-8** Participants in the Development of GAAP

### SECURE YOUR KNOWLEDGE 1-2

- The guidelines, procedures, and practices that a company is required to use in recording and reporting accounting information in its financial statements (GAAP) have evolved over many years and were set by several policy-making bodies.
- The major standard-setting bodies responsible for the establishment of GAAP include the Securities and Exchange Commission (SEC) and the Financial Accounting Standards Board (FASB).
- Before issuing a final standard, a proposed topic undergoes an extensive due process procedure that includes considerable research, numerous public hearings, and frequent deliberations.
- While final standards are intended to provide users with relevant and reliable information for their decision-making needs, social and political differences in FASB's constituency often result in final standards that are a result of compromise.
- Numerous other bodies (shown in Exhibit 1-8) have also impacted the development of GAAP.

## ETHICS IN THE ACCOUNTING ENVIRONMENT

In recent years there have been an increasing number of news reports about unethical behavior on the part of companies or individuals acting in their own self-interest without regard to the impact on society. These unethical actions include, for instance, polluting lakes and streams, illegal shipments of weapons to foreign countries, savings and loan scandals, selling products that are hazardous to users' health, overcharging on government contracts, securities fraud, accounting fraud, false advertising, and "insider trading" activities. All of these unethical behaviors have a common theme: increased profits at the expense of some aspect of society. While these unethical actions often are sensational and capture the national headlines, there are also many situations of a smaller scale in which accountants face ethical dilemmas.

**7** Use ethical models for decision making about ethical dilemmas.

Earlier we mentioned that accountants who record and report financial information must follow generally accepted accounting principles, and that auditors must express an opinion as to the fairness (in accordance with GAAP) of the financial statements. Among other things, the financial statements of a company communicate how well the employees of the company at the department, division, and corporate levels have performed in operating the company. The results reported in the audited financial statements are likely to have an effect on the company's ability to sell stock or borrow money, as well as on employees' compensation and promotion opportunities. Consequently, these employees have a vested interest in showing their performances in the best light and may pressure accountants to do so. For instance, executives at Enron and WorldCom were successful at defrauding the public.

We also mentioned that in the FASB's public hearings and open meetings various parties attempt to influence the Board in their own self-interest. These are just a few examples of situations in which accountants may be faced with *ethical dilemmas* (*ethical conflicts*), situations in which an accountant must make a decision about what is the "right" (ethical) action to take in a given set of circumstances. Because accounting is a service activity that plays an important role in society, professional accounting organizations have established "codes of ethics" for their members. One of these applies to members of the AICPA.<sup>13</sup>

Members of the AICPA recognize that they have an obligation of self-discipline above and beyond the requirements of laws and regulations. To help guide members in public practice, industry, government, and education in performing their responsibilities, the AICPA adopted the **Code of Professional Conduct (CPC)**. The CPC includes six *Principles* that express the basic tenets of ethical and professional conduct and call for an unswerving commitment to honorable behavior, even at the sacrifice of personal advantage. Exhibit 1-9 summarizes these Principles.<sup>14</sup>

#### EXHIBIT 1-9 Principles of the AICPA Code of Professional Conduct

- I. **Responsibilities:** In carrying out their responsibilities as professionals, members should exercise sensitive professional and moral judgments in all their activities.
- II. **The Public Interest:** Members should act in a way that will serve the public interest, honor the public trust, and demonstrate commitment to professionalism.
- III. **Integrity:** To maintain and broaden public confidence, members should perform all professional responsibilities with the highest sense of integrity.
- IV. **Objectivity and Independence:** A member should be objective and free from conflicts of interest in discharging professional responsibilities. A member in public practice should be independent in fact and appearance when providing auditing and other attestation services.
- V. **Due Care:** A member should observe the profession's technical and ethical standards, strive continually to improve competence and the quality of services, and discharge professional responsibility to the best of the member's ability.
- VI. **Scope and Nature of Services:** A member in public practice should observe the Principles of the CPC in determining the scope and nature of services to be provided.

While this code of ethics establishes guidelines for accountants in performing their responsibilities, it does not provide a structured approach for "moral reasoning" in ethical dilemmas. Ethical behavior may be different from legally acceptable behavior. What is

13. For the code of ethics of the IMA, another professional accounting organization, see *Ethics Center*, IMA: [www.imanet.org](http://www.imanet.org).

14. *AICPA Code of Professional Conduct*, AICPA: [www.aicpa.org](http://www.aicpa.org).

legal may still be unethical in certain circumstances. Ethicists have developed alternative “models” to help individuals make sound moral judgments and guide their behavior when faced with ethical dilemmas involving various stakeholders. In the business environment of a company, the *stakeholders* may include past, current, and potential investors; creditors; employees; suppliers; competing companies; local, state, and federal governments; and citizens in the local, regional, national, and even international communities.

According to Manuel Velasquez, a noted ethicist, there are three basic approaches to moral reasoning. Each of these approaches uses a different set of moral standards in distinguishing between right and wrong. These approaches include (1) the *utilitarian* model, which evaluates actions based on the extent to which they result in the “greatest good for the greatest number,” (2) the *rights* model, which embraces actions that protect individual moral rights, and (3) the *justice* model, which emphasizes a fair distribution of benefits and burdens. In determining if an action is ethical or which of several alternative behaviors is the most ethical, Velasquez says that no single set of moral standards is sufficient. Instead, he recommends a several-step process that combines all three types of moral standards. This process includes

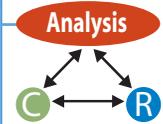

1. gathering the facts (e.g., Who are the “stakeholders?” What are my responsibilities?);
2. asking whether the action is acceptable according to three ethical criteria:
  - a. utility: Does the action optimize the satisfactions of all stakeholders?
  - b. rights: Does the action respect the rights of all individuals? and
  - c. justice: Is the action fair and just?;
3. considering whether there are any “overwhelming factors,” such as conflicts between criteria that may justify disregarding one or more of the ethical criteria; and
4. deciding whether the action is ethical (or what ethical action to take) based on an evaluation of the applicable ethical criteria.<sup>15</sup>

Accountants are noted to have high ethical standards.<sup>16</sup> Acting ethically is not always easy; sometimes it is very difficult. However, because of the important role of accounting in society, every accountant must have high moral standards and strive to behave at the highest ethical level. Throughout this book, you will be exposed to ethical dilemmas that we urge you to consider using the framework we just discussed.

## CREATIVE AND CRITICAL THINKING IN THE ACCOUNTING ENVIRONMENT

The business environment in which accountants work is constantly changing and becoming more complex. New products and services are continually introduced, and existing products are modified. Production techniques are changing, as are the channels of distribution and the approaches to promoting these products. There is an explosion of information technology as computers are networked, satellites allow global audiovisual communication, fax machines, the Internet, and e-mail enable nearly instantaneous information transmittal, and cell phones link customers and suppliers. More and more companies are becoming international in their operating activities by buying, producing, and selling products in foreign countries. Government regulations are increasing, as more concern is given to such issues as worker safety and environmental impacts.

In response to these changes, companies are becoming more innovative in the ways they manage their businesses, how they finance their activities, what they invest in to expand their operating capabilities, and what approaches they use in their credit and collection processes. They are restructuring their organizations and operations to increase

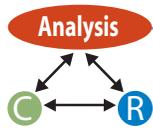

**8** Understand creative and critical thinking.

15. M. Velasquez, *Business Ethics: Concepts and Cases*, 4th ed. (Englewood Cliffs, N.J.: Prentice Hall, 1998), ch. 2.

16. “The CPA Span of Influence Study,” Research Study for AICPA by Peter W. Hart Research Associates (March 16, 2000).

efficiency, and are more sensitive to changing technology and product obsolescence. They are more creative in the ways they structure their executive and employee compensation packages. Accounting systems that are designed to accumulate, process, and communicate information for decision making in this changing environment must change to satisfy the needs of users. Accounting principles must evolve to reflect this changing environment. Accountants responsible for operating these systems, as well as for establishing and applying accounting principles, must be both *creative* thinkers and *critical* thinkers.

Research in psychology has found that each side of the brain deals with a different type of thinking. The right side focuses on creative thinking, involving visualizing and developing ideas. The left side focuses on critical thinking, involving analyzing and evaluating ideas. All individuals think creatively and critically, but they differ regarding the degree to which they use each side of the brain. However, through practice, it is possible for individuals to increase their ability to think creatively and critically.

Different aspects of creative thinking and critical thinking have been studied and discussed for many years and in numerous areas. Here, we discuss briefly what role these concepts play in financial accounting. There are many ways creative thinking and critical thinking are defined, in part because they are not mutually exclusive and the differences between the two types of thinking are not clear-cut. For our purposes, **creative thinking is the process of finding new relationships (ideas) among items of information that potentially can be used to solve a problem.** Creative thinking involves using imagination and insight to see issues in a different light. Terms that are used to describe a creative thinker include insightful, intuitive, imaginative, sensitive, flexible, original, adaptable, and tolerant of ambiguity.<sup>17</sup> In contrast, **critical thinking is the process of testing these new relationships (ideas) to determine how well they will work.** Critical thinking involves using inductive or deductive reasoning to analyze an issue logically. Terms that are used to describe a critical thinker include objective, independent, analytical, logical, rational, able to synthesize, consistent, and organized.<sup>18</sup>

In financial accounting, accountants tend to be “problem solvers.” When an accounting issue or problem arises, the accountant is responsible for its resolution. Several steps have been identified in the problem-solving process, as we show in Exhibit 1-10. These steps include

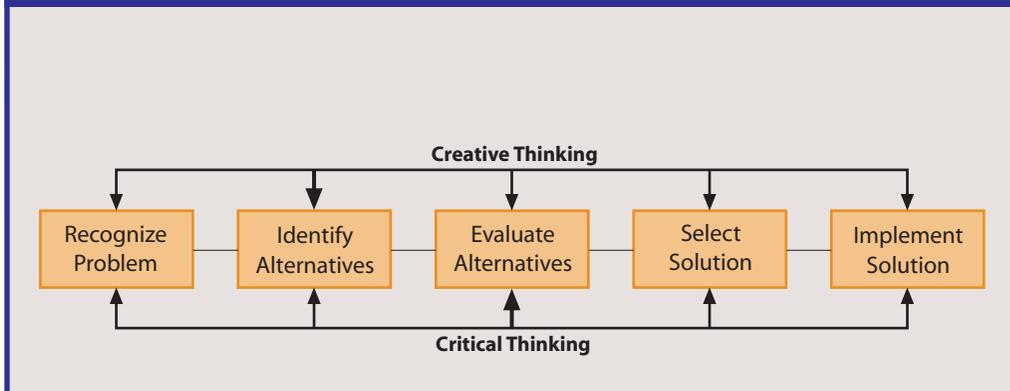

1. recognizing a problem,
2. identifying alternative solutions,
3. evaluating the alternatives,
4. selecting a solution from among the alternatives, and
5. implementing the solution.

Creative thinking and critical thinking both play a role in each step of the problem-solving process. However, creative thinking is probably most critical in the *identification* of alternative solutions, while critical thinking is most critical in the *evaluation* of the alternative solutions.

The degree of complexity may differ from one problem to another. Problems can range from structured problems to unstructured problems. For *structured* problems, virtually complete information is known about the alternatives (in fact, there may be only one alternative) so that identifying, evaluating, selecting, and implementing an alternative is straightforward. At the other extreme are *unstructured* problems where even the basic issue may not be readily apparent, the alternative solutions are unclear once the problem is

17. For a more extensive discussion of creative thinking, see S. F. Isaksen, K. Dorval, and D. Treffinger, *Creative Approaches to Problem Solving*, 2nd ed. (Williamsville, NY: Creative Problem Solving Group-Buffalo, 2000).

18. For a more extensive discussion of critical thinking, see J. Chaffee, *Thinking Critically*, 6th ed. (New York: Houghton Mifflin Company, 2000).

**EXHIBIT 1-10 Creative and Critical Thinking: Impact on Problem Solving**

identified, and there is a lack of information about the alternatives. Here the identification, evaluation, selection, and implementation process is much more complex. Between these extremes is the *partially structured* problem, where either the alternative solutions are unclear or there is a lack of information about the alternative solutions.

At the policy-making level, the FASB deals with complex unstructured problems. The Board members engage in higher-order creative thinking and critical thinking in their problem-solving processes involving the *establishment* of generally accepted accounting principles. In this book we discuss the major issues faced by the FASB in setting standards. However, our primary focus is on the *application* of generally accepted accounting principles in the recording and reporting of various topics. These topics may be general (e.g., income measurement) or specific (e.g., inventory). For each topic, we identify GAAP, discuss the related conceptual issues, and explain the recording and reporting procedures.

In the exercises and problems at the end of each chapter, we focus primarily on assignments intended to help you reinforce your understanding of the topical material. We do so by requiring you to prepare solutions to issues related to the chapter topics. These assignments generally involve structured problems for which there are only one or two correct solutions. Here the steps of identification, evaluation, and selection of alternatives in the problem-solving process are reduced or omitted. This approach does not mean that your creative thinking and critical thinking processes are not at work, however. In solving these assignments, you are practicing both creative and critical thinking, but at a lower level. It is important to master the understanding of basic recording and reporting issues in financial accounting. Then you can move on to more complex accounting issues that involve less structured problems and entail higher-level creative and critical thinking.

As a step in helping you develop your higher-level creative and critical thinking skills, there are also cases at the end of each chapter. These cases may require you to explain your understanding of interrelated concepts and practices. They may also require you to determine solutions to issues for which specific generally accepted accounting principles do not apply directly. These cases may deal with accounting issues that are emerging because of changes in the business environment we discussed earlier. They may focus on topics that are too “industry specific” to be included in the chapter material. In these latter situations, the cases (“research simulations”) will require you to “research GAAP” in documents such as the FASB’s *Current Text* or *Original Pronouncements* (or FARS) and, in so doing, stimulate your higher-level creative and critical thinking as you complete the problem-solving process. If your instructor does not assign these cases, you may still want to analyze them as a way of practicing creative and critical thinking. Your ability to think creatively and critically will be very important in your future accounting and business (as well as personal) activities.

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

1. **Understand capital markets and decision making.** Capital markets are organized exchanges such as the NYSE, AMEX, and NASDAQ, where the capital stock and bonds of publicly held corporations are purchased and sold. Investors make buy-hold-sell decisions in regard to securities traded on these capital markets based on accounting information.
2. **Know what is included in financial reporting.** Financial reporting involves communicating financial accounting information about a company to external users. An important way to do so is in a company's annual report. In its annual report, a company includes at least three financial statements—a balance sheet, income statement, and statement of cash flows—and may include a statement of changes in stockholders' equity. It also includes notes to the financial statements.
3. **Explain GAAP and its sources.** GAAP are the guidelines, procedures, and practices that a company is required to use in recording and reporting the accounting information in its audited financial statements. The sources of GAAP included pronouncements by the FASB, APB, CAP, and SEC in four categories of descending order of importance.
4. **Identify the types of pronouncements issued by the FASB.** The FASB issues several types of pronouncements including *Statements of Financial Accounting Standards*, *Interpretations*, *Staff Positions*, *Technical Bulletins*, *Statements of Financial Accounting Concepts*, and other pronouncements, such as *Guides for Implementation* and *FASB Q's and A's*.
5. **Understand how the FASB operates.** The FASB is a seven-member board. Before issuing a statement of concepts or standards, the FASB goes through several steps which include conducting research and issuing a Discussion Memorandum or Invitation to Comment, holding public hearing and deliberating on findings before issuing an Exposure Draft, holding more public hearings, modifying its tentative conclusions, voting (simple-majority), and issuing the Statement.
6. **Describe the relationship between the SEC and the FASB.** The SEC has the legal authority to prescribe accounting principles and practices for all publicly traded companies. It, however, endorsed the workings of the FASB by stating that the standards set by the FASB will be considered by the SEC to have substantial authoritative support.
7. **Use ethical models for decision making about ethical dilemmas.** Models for ethical decision making include the *utilitarian* model, the *rights* model, and the *justice* model. In using these models, one several-step approach includes (1) gathering the facts; (2) asking whether the action is acceptable according to utility, rights, and justice ethical criteria; (3) considering any "overwhelming factors"; and (4) deciding whether the action is ethical.
8. **Understand creative and critical thinking.** Creative thinking is the process of finding new relationships (ideas) among items of information that potentially can be used to solve a problem. Critical thinking is the process of testing these new relationships (ideas) to determine how well they will work. In problem solving, creative thinking is most important in the *identification* of alternative solutions, while critical thinking is most important in the *evaluation* of the alternative solutions.

## QUESTIONS

- Q1-1** Distinguish between primary markets and secondary markets.
- Q1-2** Distinguish between the categories of users of financial statements. Why might their decision-making needs be different?
- Q1-3** Compare and contrast financial and managerial accounting.
- Q1-4** What is financial reporting and what is an important way a company's financial information is reported?
- Q1-5** What are the three major financial statements of a company and what do they show? What is the fourth major financial statement that many companies present, and what does it show?
- Q1-6** What are generally accepted accounting principles? List the four accounting bodies that have established generally accepted accounting principles.
- Q1-7** How many "categories" are in the hierarchy of generally accepted accounting principles? List the pronouncements that are included in Category A.
- Q1-8** What are (were) the CAP, APB, and FASB? What documents that constitute generally accepted accounting principles have been issued by each of these organizations?
- Q1-9** Briefly discuss the procedures followed by the FASB for issuing a statement of concepts or standards.
- Q1-10** List and briefly discuss the types of pronouncements issued by the FASB.

**Q1-11** List several organizations other than the FASB that have had an impact on the development of generally accepted accounting principles.

**Q1-12** What is the IASB and how does it operate?

**Q1-13** List several professional organizations that play an important role in the accounting standard-setting process.

**Q1-14** What is the *Code of Professional Conduct* and what are the six areas covered in the Principles of this code?

**Q1-15** List the steps a person should follow to determine whether an action is ethical.

**Q1-16** What is creative thinking? How would you describe a creative thinker?

**Q1-17** What is critical thinking? How would you describe a critical thinker?

## CASES

### COMMUNICATION

#### C1-1 Pronouncements

Several accounting groups have issued various pronouncements establishing or relating to generally accepted accounting principles. The following is a list of six pronouncements, as well as a list of statements describing each pronouncement.

- A. Statements of Financial Accounting Standards
- B. Opinions
- C. Technical Bulletins
- D. Statements of Financial Accounting Concepts
- E. Interpretations
- F. Staff Positions
- G. Accounting Research Bulletins

- \_\_\_\_\_ 1. Pronouncements that provide clarification of conflicting or unclear issues relating to previously issued FASB *Statements of Standards*, APB *Opinions*, or *Accounting Research Bulletins*.
- \_\_\_\_\_ 2. Issued by the FASB to provide guidance on accounting and reporting problems related to *Statements of Standards* or *Interpretations*.
- \_\_\_\_\_ 3. Pronouncements of the APB that constitute generally accepted accounting principles unless specifically amended or rescinded, many of which were based on *Accounting Research Studies*.
- \_\_\_\_\_ 4. Issued by the FASB as a series establishing a theoretical foundation upon which to base financial accounting and reporting standards.
- \_\_\_\_\_ 5. Pronouncements of the Committee on Accounting Procedure (CAP) that constitute generally accepted accounting principles unless superseded or amended by other authoritative bodies.
- \_\_\_\_\_ 6. Pronouncements issued by the FASB that establish generally accepted accounting principles and indicate the methods and procedures required on specific accounting issues.
- \_\_\_\_\_ 7. Pronouncements issued to provide more timely and consistent application guidance in regard to FASB literature.

#### Required

Place the appropriate letter (A–G) identifying each pronouncement on the line in front of the statement describing the pronouncement.

#### C1-2 Organizations

Certain organizations have been influential in the establishment of accounting principles. The following is a list of abbreviations for several of these organizations, as well as a list of statements describing the organizations.

- |          |          |
|----------|----------|
| A. IRS   | G. CASB  |
| B. APB   | H. FASB  |
| C. CAP   | I. PCAOB |
| D. IASB  | J. GASB  |
| E. SEC   | K. AICPA |
| F. FASAC | L. EITF  |

- \_\_\_\_\_ 1. First organization in United States to be given authority to issue pronouncements on accounting procedures and practice. Issued *Accounting Research Bulletins*.
- \_\_\_\_\_ 2. Establishes cost accounting standards for U.S. government contracts.
- \_\_\_\_\_ 3. Administers the provisions of the Internal Revenue Code.
- \_\_\_\_\_ 4. Helps establish internationally comparable accounting principles.
- \_\_\_\_\_ 5. Establishes accounting standards for state and local governmental entities.
- \_\_\_\_\_ 6. Establishes generally accepted accounting principles in the private sector of the United States.
- \_\_\_\_\_ 7. Created by Congress in response to fraudulent accounting practices.
- \_\_\_\_\_ 8. Responsible for advising the FASB about technical areas, task forces, and other matters.
- \_\_\_\_\_ 9. Established 31 *Opinions*, many of which still constitute generally accepted accounting principles.

- \_\_\_\_\_ 10. Has legal authority to prescribe accounting principles and reporting practices for all corporations issuing publicly traded securities.
- \_\_\_\_\_ 11. Professional organization for all CPAs in the United States.
- \_\_\_\_\_ 12. Develops consensus positions on the implementation issues involving the application of standards.

**Required**

Place the appropriate letter (A–L) for each organization in front of the statement describing the organization. In addition, write out the full name of the organization.

**C1-3 Establishment of GAAP**

Since the late 1930s, three organizations have been primarily responsible for the establishment of generally accepted accounting principles in the private sector of the United States.

**Required**

Write a brief report that identifies the three organizations and provides a brief chronological history of each, including the pronouncements issued that still constitute generally accepted accounting principles.

**C1-4 Accounting Principles**

**AICPA Adapted** At the completion of the Darby Department Store audit, the president asks about the meaning of the phrase “in conformity with generally accepted accounting principles” that appears in your audit report on the management’s financial statements. He observes that the meaning of the phrase must include more than what he thinks of as “principles.”

**Required**

1. Explain the meaning of the term “accounting principles” as used in the audit report. (Do not discuss in this part the significance of “generally accepted.”)
2. The president wants to know how you determine whether or not an accounting principle is generally accepted. Discuss the sources of evidence for determining whether an accounting principle has substantial authoritative support. Do not merely list the titles of publications.

**C1-5 Standard Setting**

**CMA Adapted** When the Accounting Principles Board was founded in 1959, it planned to establish financial

accounting standards using empirical research and logical reasoning only; the role of political action was little recognized at that time. Today, there is wide acceptance of the view that political action is as much an ingredient of the standard-setting process as is research evidence. Considerable political and social influence is wielded by user groups—those parties who are most interested in or affected by accounting standards.

Two basic premises of the Financial Accounting Standards Board (FASB) are (1) that it should be responsive to the needs and viewpoints of the entire economic community, and (2) that it should operate in full view of the public, affording interested parties ample opportunity to make their views known. The extensive procedural steps employed by the FASB in the standard-setting process support these premises.

**Required**

Write a brief report that describes why financial accounting standards inspire or encourage political action and social involvement during the standard-setting process.

**C1-6 Organization of the FASB**

The FASB is organized to establish generally accepted accounting principles. It is assisted by various groups and operates under a set of procedures.

**Required**

Prepare a short written report that summarizes the structure, types of pronouncements, and operating procedures of the FASB.

**C1-7 GAAP and the AICPA**

The American Institute of Certified Public Accountants (AICPA) has been in existence for many years to help CPAs provide high-quality professional services. Among other activities, in certain circumstances the AICPA establishes or provides guidance on generally accepted accounting principles (GAAP).

**Required**

Summarize the GAAP-related documents that the AICPA publishes.

**C1-8 Code of Professional Conduct**

In a few years, you may become a member of the AICPA and be subject to its Code of Professional Conduct (CPC).

**Required**

Identify and briefly discuss the first five principles of the CPC. Provide examples that illustrate each principle.

**CREATIVE AND CRITICAL THINKING****C1-9 GAAP Hierarchy**

A friend of yours says, “I understand there are ‘rules’ for financial reporting. But what are these rules, where can a person find them, and which ones are more important?”

**Required**

Prepare an answer for your friend.

**C1-10 Lobbying the FASB**

One of your friends remarks, “I understand that before voting on a Statement of Standards the FASB allows written comments and oral presentations in which interested parties can lobby for a particular ruling. Do you think this is a good idea?”

**Required**

Prepare a written response that discusses the advantages and disadvantages of the FASB's allowing interested parties to provide input to its deliberative process.

**C1-11 Ethical Responsibilities**

Each person in one of your accounting classes is required to write a report on an accounting topic. Included in the report must be a discussion from a specific library book. When you go to the library, you find that the only copy of the book is missing. While sitting at a study desk, you overhear one of your classmates say that he has "misfiled" the book in the library so he can use it again later without having to wait for other students to finish using it.

**Required**

Discuss the steps you would take to address this ethical dilemma. It is not necessary to state what ethical action you

would take, but be prepared to discuss your reasoning for each step.

**C1-12 Ethical Responsibilities**

You and a friend are in the same accounting class. During the first test, you observe that your friend cheated by copying one of her answers from another student (who was unaware of the copying). When the exams are returned, your grade is a B, while your friend's grade is an A.

**Required**

Discuss the steps you would take to address this ethical dilemma. It is not necessary to state what ethical action you would take, but be prepared to discuss your reasoning for each step.

## 2

## OBJECTIVES

After reading this chapter, you will be able to:

- 1 Explain the FASB conceptual framework.
- 2 Understand the relationship among the objectives of financial reporting.
- 3 Identify the general objective of financial reporting.
- 4 Describe the three specific objectives of financial reporting.
- 5 Discuss the types of useful information for investment and credit decision making.
- 6 Explain the qualities of useful accounting information.
- 7 Understand the accounting assumptions and principles that influence GAAP.
- 8 Define the elements of financial statements.

## Financial Reporting: Its Conceptual Framework

### If It's Broken ... Fix It!

U.S. GAAP is widely considered the most complete and well-developed set of accounting standards in the world. However, because of the recent accounting scandals, U.S. accounting standards have come under increasing criticism as being too rules-based. Some have also questioned the role of accounting standards in facilitating these financial reporting failures. The criticisms of U.S. accounting standards are that they had become too long and complex, contained too many percentage tests (bright lines), and allowed numerous exceptions to the principles underlying the standards. Together, the rules-based nature of the standard is seen to have fostered a “check-the-box mentality” that allowed financial “engineers” to comply with the letter of the standard while not always showing the underlying reality of the transaction. In its review of U.S. accounting standards, the **Securities and Exchange Commission (SEC)** noted that the lease accounting rules are made up of approximately 16 FASB Statements and Interpretations, 9 Technical Bulletins, and more than 30 EITF Abstracts. Also, there are more than 800 pages of accounting guidance relating to derivatives. One prominent controller described recently issued accounting guidance as a mistake that was so complicated that organizations are uncertain if they can even follow the rules. What is the solution?

The SEC has recommended that future accounting standards should not follow a rules-based, nor principles-only approach, but

Credit: Image Source

should be “objectives-oriented.” This principles-based standard setting approach should be built on an improved and consistently applied conceptual framework. This framework should clearly state the accounting objective of the standard, provide sufficient detail and structure so that the standard can be applied consistently, minimize exceptions to the standard, and avoid the use of bright-line tests. The development of objectives-oriented standards should improve the relevance, reliability, and comparability of financial information resulting in more meaningful and informative financial statements.

### FOR FURTHER INVESTIGATION

For a discussion of principles-based accounting standards and the implications for accounting standard setting, consult the Business & Company Resource Center (BCRC) and the Internet:

- Defining Principles-Based Accounting Standards. Rebecca Toppe Shortridge, Mark Myring, *The CPA Journal*, 0732-8435, August 2004, v74 i8 p34(4).
- Study Pursuant to Section 108(d) of the Sarbanes-Oxley Act of 2002 on the Adoption by the United States Financial Reporting System of a Principles-Based Accounting System, Securities and Exchange Commission, <http://www.sec.gov/news/studies/principlesbasedstand.htm>.

As we saw in Chapter 1, accounting standards were developed in the United States by the Committee on Accounting Procedure (CAP) and the Accounting Principles Board (APB) before the inception of the Financial Accounting Standards Board (FASB). The CAP and the APB were not able to develop a broad, normative conceptual framework of accounting theory. The APB did issue **APB Statement No. 4**, “Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises.” However, this document described current practice instead of what *should* be appropriate accounting. Although the CAP and APB considered some accounting concepts in setting of accounting standards, generally this was limited to the concepts related to the particular accounting issue at hand. This led, at times, to accounting principles that were inconsistently applied from one issue to another. These inconsistencies led to political pressure on the FASB to develop a general set of concepts and principles to guide its standard setting. In this chapter we discuss the FASB’s conceptual framework of accounting theory. This framework includes:

- the objectives of financial reporting
- the types of useful accounting information
- the qualitative characteristics of accounting information
- accounting assumptions and principles

We also include a brief review of generally accepted accounting principles and financial statements.

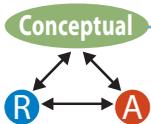

## FASB CONCEPTUAL FRAMEWORK

The FASB has been given two charges. First, it is to develop a conceptual framework of accounting theory. Second, it is to establish standards (generally accepted accounting principles) for financial accounting practice. The intent is to develop a **theoretical foundation of interrelated objectives and concepts that leads to the establishment of consistent financial accounting standards**. In other words, the conceptual framework should provide a logical structure and direction to financial accounting and reporting. This conceptual framework is expected to:

1. guide the FASB in establishing accounting standards
2. provide a frame of reference for resolving accounting questions in situations where a standard does not exist
3. determine the bounds for judgment in the preparation of financial statements
4. increase users’ understanding of and confidence in financial reporting
5. enhance comparability

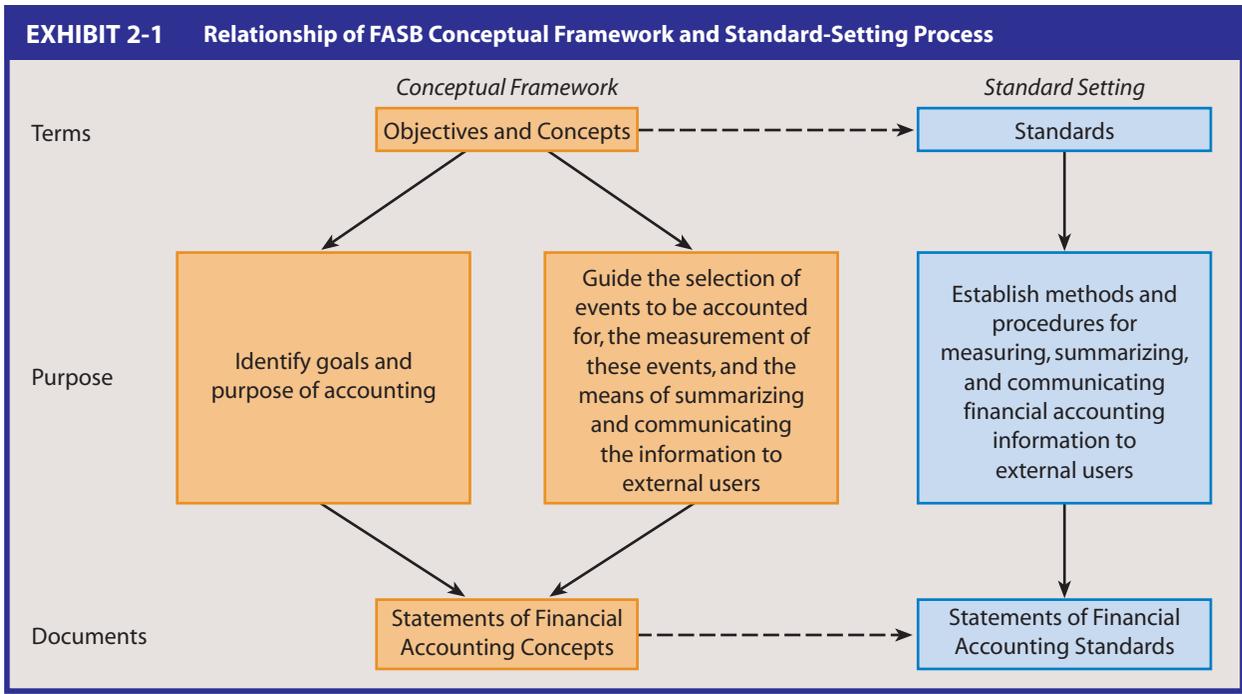

The FASB expects that the conceptual framework will encourage companies to provide financial (and related) information that is useful in efficiently allocating scarce economic resources in capital and other markets.<sup>1</sup>

Exhibit 2-1 shows the relationship among the objectives, concepts, and standards, their purposes, and the documents issued by the FASB. The outputs of the conceptual framework are *Statements of Financial Accounting Concepts*; to date, seven have been issued. The outputs of the standard-setting process are *Statements of Financial Accounting Standards*; to date 154 have been issued. The many “statements of standards” are required to identify the preferable accounting practice from the various alternatives that arise in response to the changing, dynamic business environment. As much as possible, the FASB considers its conceptual framework in establishing these standards.

1 Explain the FASB conceptual framework.

1. This discussion is based on a background paper, “The Conceptual Framework Project,” Financial Accounting Standards Board (Stamford, Conn., 1980).

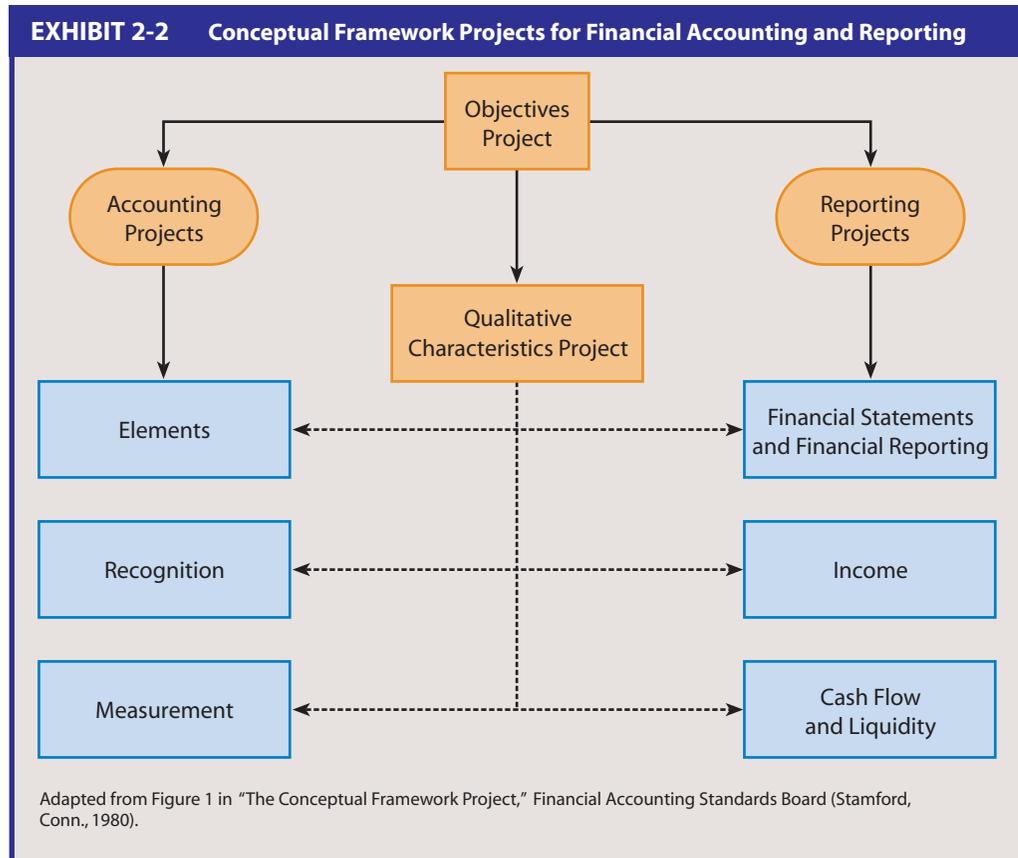

Because of the large task, the FASB divided its conceptual framework activities into several projects. Exhibit 2-2 shows these projects. The first project dealt with identifying the objectives of financial reporting. This project resulted in **FASB Statement of Financial Accounting Concepts No. 1**, “Objectives of Financial Reporting by Business Enterprises.” This document established the focus of the remaining projects, which are divided into two groups (accounting and reporting). The Qualitative Characteristics Project linked together the accounting and reporting projects, as illustrated by the dashed lines in Exhibit 2-2. It also resulted in **FASB Statement of Financial Accounting Concepts No. 2**, “Qualitative Characteristics of Accounting Information.”

The accounting projects define the accounting elements (e.g., assets, liabilities, revenues, expenses) and identify which elements should be reported, when they should be reported (recognized), and how they should be measured.<sup>2</sup> The reporting projects deal with how the elements of financial reports are “displayed.” Important issues include general questions such as what information should be provided, who should be required to provide the information, and where the information should be presented. Also included are more specific questions about income and its components, as well as cash flow and its components.

The FASB has issued several Statements of Concepts that deal with one or more of these accounting and reporting projects. **FASB Statement of Financial Accounting Concepts No. 3** was issued in 1980. However, this Statement of Concepts was replaced in 1986 by **FASB Statement of Financial Accounting Concepts No. 6**, “Elements of Financial Statements.” **FASB Statement of Financial Accounting Concepts No. 5**, “Recognition and Measurement in Financial Statements of Business Enterprises,” was issued in 1984.<sup>3</sup> **FASB Statement of Financial Accounting Concepts No. 7**, “Using Cash Flow Information and Present Value in Accounting Measurements,” was issued in 2000. An Exposure Draft, *FASB Proposed Statement*

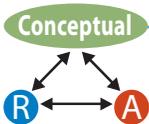

2. For a discussion of these and other issues, see L. T. Johnson and R. K. Storey, “Recognition in Financial Statements: Underlying Concepts and Practical Conventions,” *Research Report* (Stamford, Conn.: FASB, 1982).  
 3. **FASB Statement of Financial Accounting Concepts No. 4**, titled “Objectives of Financial Reporting by Nonbusiness Organizations,” has also been issued but is not discussed in this book.

of *Financial Accounting Concepts*, "Reporting Income, Cash Flows, and Financial Position of Business Enterprises," was issued regarding the reporting projects. In addition, several working documents dealing with both accounting and reporting issues were published that may eventually lead to the issuance of other statements of financial accounting concepts. We discuss the Statements of Concepts dealing with the elements, recognition and measurement, and reporting of income and cash flows in Chapters 4 and 5.

In this chapter we discuss the first two Statements of Concepts dealing with the objectives of financial reporting and the qualitative characteristics of accounting information. We also discuss parts of the Exposure Draft dealing with types of useful information.

## OBJECTIVES OF FINANCIAL REPORTING

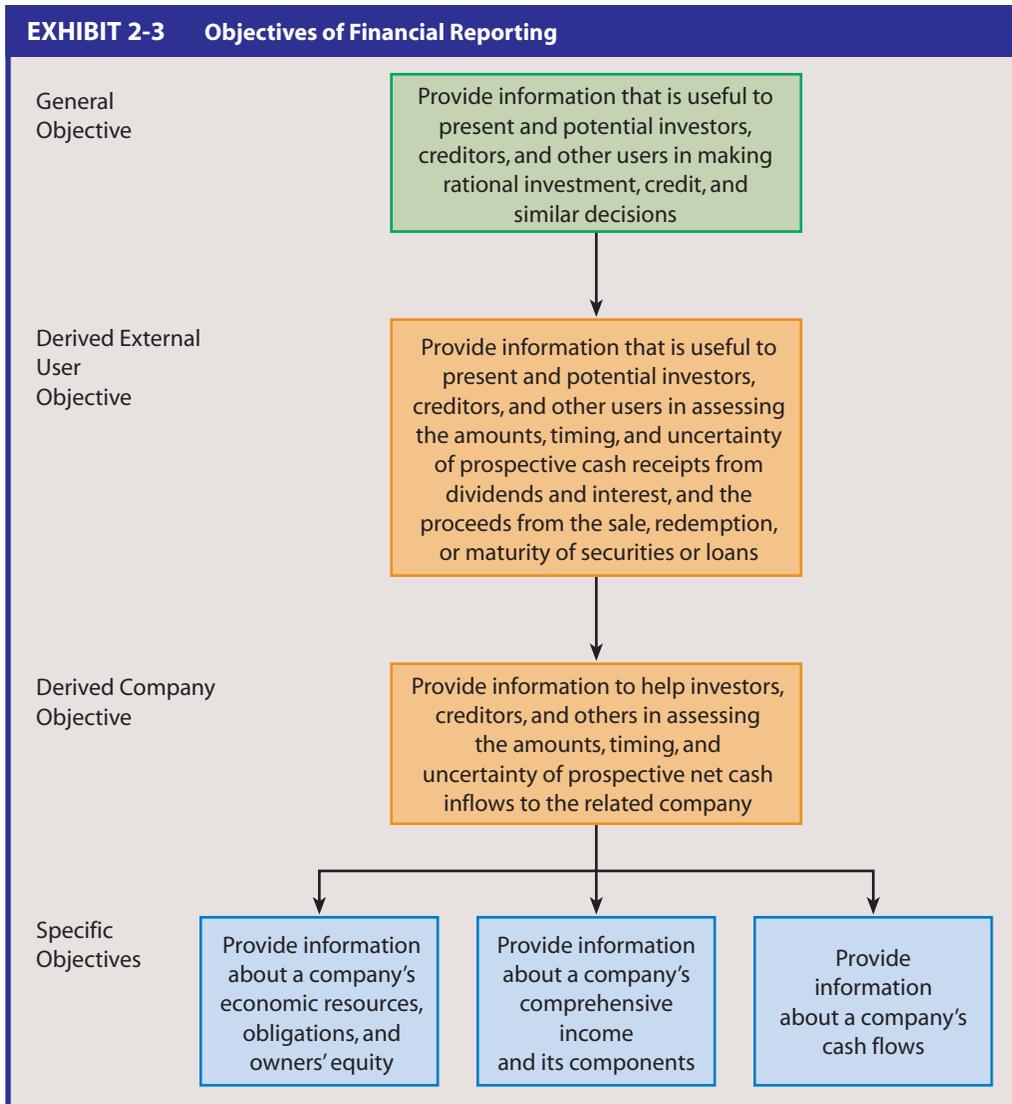

**2** Understand the relationship among the objectives of financial reporting.

In its first concepts statement, the FASB stated that the objectives of financial reporting are those of *general-purpose* external reporting by companies. That is, the objectives relate to a *variety* of *external* users as opposed to specific internal users, such as management. These external users do not have the authority to prescribe the financial information they desire from a particular company. Therefore, they must use the information that the management of the company communicates to them.<sup>4</sup>

The FASB identified several objectives of financial reporting. These objectives proceed from the more general to the more specific. We show these objectives in Exhibit 2-3 and discuss them in the following sections.<sup>5</sup>

4. "Objectives of Financial Reporting by Business Enterprises," *FASB Statement of Financial Accounting Concepts No. 1* (Stamford, Conn.: FASB, 1978), par. 28.

5. The discussion in this section primarily is a summary of that presented by the FASB in its "Objectives of Financial Reporting by Business Enterprises."

### Information Useful in Decision Making

The top of Exhibit 2-3 shows the most general objective. This objective states that **financial reporting should provide useful information for present and potential investors, creditors, and other external users in making their investment, credit, and similar decisions**. Investors include both equity security holders (stockholders) and debt security holders (bondholders). Creditors include suppliers, customers and employees with claims, individual lenders, and lending institutions. Other external users include brokers, lawyers, security analysts, and regulatory agencies. These external users are expected to have a reasonable understanding of business and economic activities. They are also expected to be willing to study carefully the information to comprehend it.

**3** Identify the general objective of financial reporting.

### Information Useful to External Users in Assessing Future Cash Receipts

The second objective shown in Exhibit 2-3 relates to external users' needs. It states that **financial reporting should provide information that is useful to external users in assessing the amounts, timing, and uncertainty of prospective cash receipts**. This objective is important because individuals and institutions make cash outflows for investing and lending activities primarily to increase their cash inflows. Whether or not

they are successful depends on the extent to which they receive a return of cash, goods, or services greater than their investment or loan. That is, they must receive not only a return *of* investment, but also a return *on* investment relative to the risk involved. Investment and credit decisions involve choices between present and prospective future cash flows. External users need financial information to help set expectations about the timing and amount of prospective cash receipts (e.g., dividends, interest, proceeds from resale, or repayment) and assess the risk involved.

### Information Useful in Assessing Company Cash Flows

Since investors invest in and creditors lend to a particular company, their current and prospective cash receipts are affected by the cash flows of the company. Thus, a third objective shown in Exhibit 2-3 is that **financial reporting should provide information to help external users in assessing the amounts, timing, and uncertainty of the prospective net cash inflows to the related company.** This objective logically flows from the second objective, because a company also invests cash in noncash resources to earn more cash and receive a return *on* its investment in addition to a return *of* its investment.

A company's investment activities are more complex, however, than those of external users. The company completes an "operating cycle" or cycles during which it acquires goods or services, increases their value, sells the goods or services, and collects the selling price. Within this operating cycle numerous cash receipts and payments are collected and paid, in no precise order. The company's ability to generate net cash inflows (i.e., cash inflows greater than cash outflows) affects both its ability to pay dividends and interest and the market prices of its securities. These, in turn, affect investors' and creditors' cash flows.

### Information About Economic Resources and Claims to These Resources

The most specific objectives in Exhibit 2-3 are those in the bottom tier, which indicate the types of information that a company should provide in its financial reports. A **specific objective of financial reporting is to provide information about a company's economic resources, obligations, and owners' equity.** This information is useful to external users for four reasons:

- to identify the company's financial strengths and weaknesses and to assess its liquidity
- to provide a basis for evaluating information about the company's performance during a given period
- to provide direct indications of the cash flow potentials of some resources and the cash needed to satisfy obligations
- to indicate the potential cash flows that are the joint result of combining various resources in the company's operations

### Information About Comprehensive Income and Its Components

Another specific objective of financial reporting is to provide information about a company's financial performance during a specified period to help external users form expectations about its future performance. The *primary* focus of financial reporting about a company's performance is information concerning the company's *comprehensive income and its components.* Information about comprehensive income is useful to external users in:

- evaluating management's performance
- estimating the company's "earning power," or other amounts that are representative of long-term income-producing ability
- predicting future income
- assessing the risk of investing in or lending to the company

4 Describe the three specific objectives of financial reporting.

We discuss comprehensive income in Chapter 5.

The measurement of comprehensive income should relate (i.e., match) the costs (sacrifices) of a company's operations to the benefits from its operations. The measurement should also include the benefits and costs of other nonoperating transactions, events, and circumstances. This is accomplished by using accrual accounting. Under **accrual accounting** the financial effects of a company's transactions, events, and circumstances having cash consequences are related to the period in which they occur instead of to when the cash receipt or cash payment takes place.<sup>6</sup>

### Information About Cash Flows

Although information about comprehensive income is important to external users, **another specific objective of financial reporting is to provide information about a company's cash flows.** Cash flow information shows how a company obtains and spends cash for its operations, investments, borrowings, and capital transactions, including cash dividends and other distributions of company resources to owners. External users use cash (or cash and cash equivalents) flow information about a company to:

- help understand its operations
- evaluate its financing and investing activities
- assess its liquidity
- interpret the comprehensive income information provided

### Other Issues

The FASB raised two other important issues in *FASB Statement of Concepts No. 1*. First, **financial reporting should provide information about how the management of a company has discharged its stewardship responsibility** to owners (stockholders) for using the company resources. The management is responsible to the owners for the custody and safekeeping of the resources, their efficient and profitable use, and their protection against unfavorable economic impacts, technological developments, and social changes.

Second, **a company's financial statements and other means of financial reporting should include explanations and interpretations by its management to help external users understand the financial information provided.** This is known as **full disclosure**. Since a company's management knows more about the company's activities than "outsiders," the usefulness of financial information can be enhanced by, for instance:

- explanations of certain transactions, events, and circumstances
- interpretations of the effects on the financial results of dividing continuous operations into accounting periods
- explanations of underlying assumptions or methods used and any related significant uncertainties

The FASB established the qualitative characteristics (e.g., relevance, reliability) that accounting information should possess to be included in financial reports in *FASB Statement of Concepts No. 2*. We include them in the next section of this chapter. The FASB includes definitions of the elements (e.g., assets, liabilities, revenues, and expenses) of financial statements in *FASB Statement of Concepts No. 6*. We include them later in this chapter. We discuss financial statement elements in Chapters 4 and 5.

The FASB's first step in developing its conceptual framework was to establish the objectives of financial reporting. The FASB intends that these objectives will be guidelines

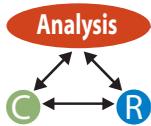

6. *FASB Statement of Concepts No. 1* originally used the term "earnings" instead of "comprehensive income." This latter term was substituted in *FASB Statement of Concepts No. 5* because comprehensive income includes more components. We discuss this issue more fully in Chapter 4.

for providing financial information for investment and credit decisions. Thus, these guidelines will help in the efficient operation of the capital markets and in promoting the efficient allocation of scarce resources.

5 Discuss the types of useful information for investment and credit decision making.

## TYPES OF USEFUL INFORMATION

The general objective of financial reporting is to provide information that is useful in investment and credit decision making. On a more specific level, a company's financial reports should provide information to help external users assess the amounts, timing, and uncertainty about its future net cash inflows. The FASB has identified five types of information as being useful in meeting this specific objective. Exhibit 2-4 shows the interrelationship of this useful information with financial reports and external decision making.

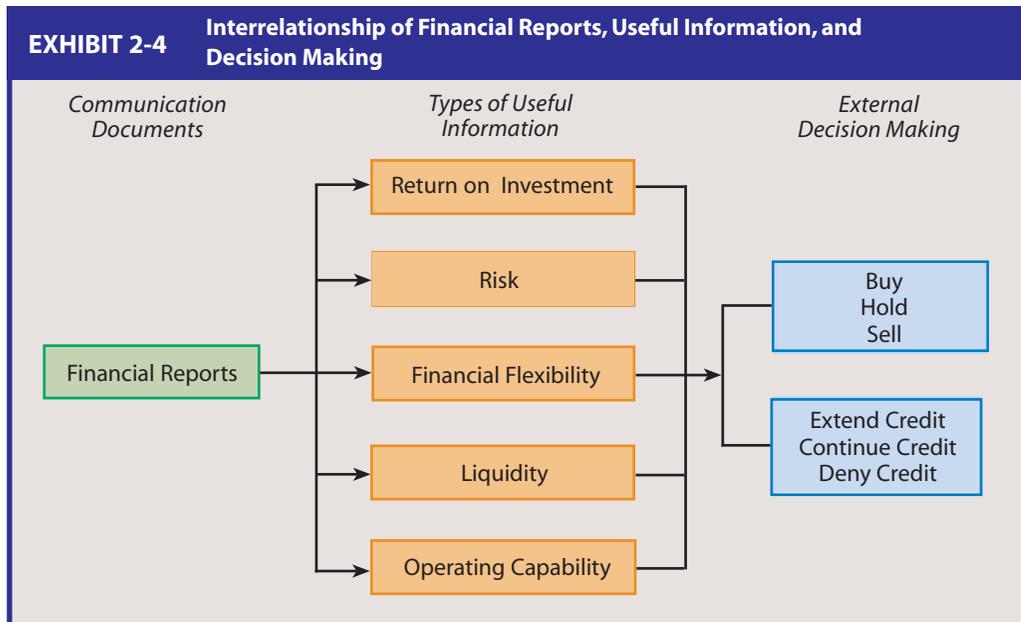

### Return on Investment

**Return on investment provides a measure of overall company performance.** Shareholders (stockholders) invest capital for a share of the equity (stockholders' equity) of a company. These investors are concerned with a return *on* capital. Before a company can provide a return on capital, its capital must be maintained or recovered (i.e., first there must be a return *of* capital to the company). Once a company's capital is maintained, the return *on* capital (i.e., comprehensive income) may be distributed to investors or may be retained by the company for reinvestment.

### Risk

**Risk is the uncertainty or unpredictability of the future results of a company.** The greater the range within which a company's future results are likely to fall, the greater the risk of an investment in or extension of credit to the company. Risk is caused by numerous factors including, for example, high rates of technological change, uncertainty about demand, exposure to the effects of price changes, and political changes in the United States and other countries. In general, the greater the risk of an investment in a particular company, the higher the rate of return expected by investors (or the higher the rate of interest charged by creditors).

## Financial Flexibility

**Financial flexibility is the ability of a company to use its financial resources to adapt to change.** Financial flexibility is important because it enables a company to respond to unexpected needs and opportunities. Financial flexibility comes from a company's ability to:

- adapt operations to increase net operating cash inflows
- raise new capital through, for instance, the sale of debt or stock securities at short notice
- obtain cash by selling assets without disrupting ongoing operations

Financial flexibility affects risk as well as cash flows. It reduces the risk of failure in the event of a shortage in net cash flows from operations.

## Liquidity

**Liquidity refers to how quickly a company can convert its assets into cash to pay its bills.** Liquidity reflects an asset's "nearness to cash." For operating assets, liquidity relates to the timing of cash flows in the normal course of business. For nonoperating assets, liquidity refers to marketability. The liquidity of a company is an indication of its ability to meet its obligations when they come due. Liquidity is positively related to financial flexibility but negatively related to both risk and return on investment. A more liquid company is likely to have a superior ability to adapt to unexpected needs and opportunities, as well as a lower risk of failure. On the other hand, liquid assets often offer lower rates of return than nonliquid assets.

## Operating Capability

**Operating capability refers to the ability of a company to maintain a given physical level of operations.** This level of operations may be indicated by (1) the quantity of goods or services (e.g., inventory) of a specified quality produced in a given period or (2) the physical capacity of the fixed assets (e.g., property, plant, and equipment). Information about operating capability is helpful in understanding a company's past performance and in predicting future changes in its volume of activities. Operating capability may be affected by changes in methods of operations, changes in product lines, and the timing of the replacement of the service potential used up in operations.<sup>7</sup>

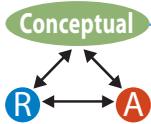

### SECURE YOUR KNOWLEDGE 2-1

- The conceptual framework consists of a coherent system of interrelated objectives and concepts that prescribes the nature, function, and limitations of financial reporting.
- The conceptual framework serves as a conceptual underpinning that provides a unified and consistent structure and direction to financial accounting and reporting that allows the FASB to effectively fulfill its mission.
- The objective of financial reporting is to provide information that is useful for external users in making investment, credit, and similar decisions. More specifically, financial reporting should provide information about a company's:
  - economic resources, obligations, and owners' equity;
  - financial performance during a specified period of time; and
  - cash flows.

(continued)

7. "Reporting Income, Cash Flows, and Financial Position of Business Enterprises," *FASB Proposed Statement of Financial Accounting Concepts* (Stamford, Conn.: FASB, 1981), par. 7–33.

- Financial reporting should provide information about how the management of a company has discharged its stewardship responsibility and include explanations and interpretations that help external users understand the financial information provided (full disclosure).
- Information relating to return on investment, risk, financial flexibility, liquidity and operating capability is considered to be useful in assessing the amounts, timing, and uncertainty of a company's future net cash flows.

## QUALITATIVE CHARACTERISTICS OF USEFUL ACCOUNTING INFORMATION

In the previous sections we discussed the types of information that are helpful in investment and credit decision making. But what are the characteristics of useful information? The purpose of *FASB Statement of Financial Accounting Concepts No. 2* is to specify the qualitative characteristics or “ingredients” that accounting information should have to be most useful.<sup>8</sup> These characteristics should be considered when choosing among accounting alternatives, because these qualities distinguish more useful from less useful information.

Each accounting alternative, however, may possess more of one quality and less of another. Although there is much agreement about the qualitative characteristics that “good” accounting information should possess, no “equation” can determine which information has the “best” combination of qualitative characteristics for decision-making purposes. Furthermore, the FASB strives to meet the needs of all users through *general-purpose* financial statements. However, the qualitative characteristics are still important for establishing common accounting standards. The qualitative criteria are helpful to the FASB in setting “minimum” and “maximum” limits of useful accounting information so that it can develop logical accounting standards consistent with these “limits.”

### Hierarchy of Qualitative Characteristics

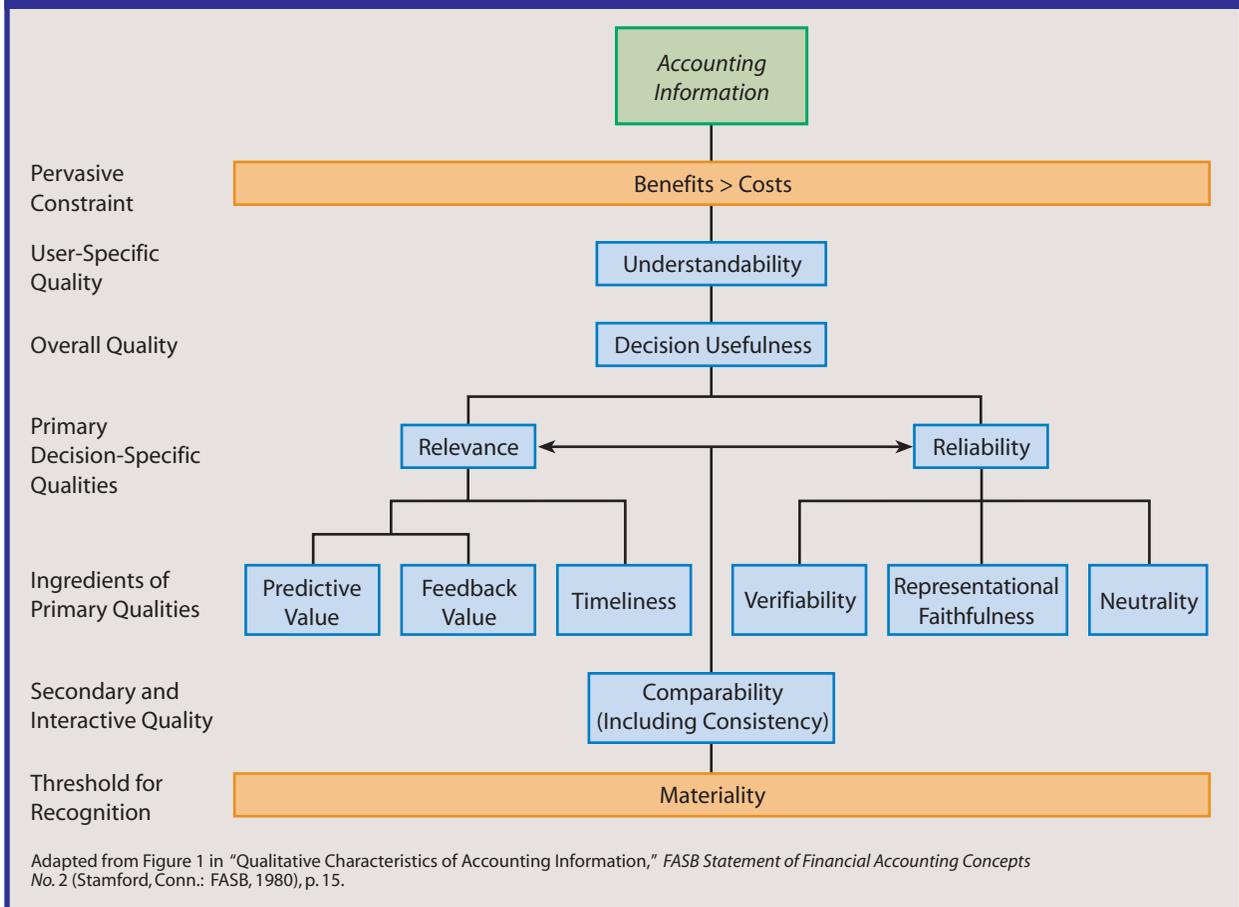

Exhibit 2-5 shows a hierarchy of the qualitative characteristics of accounting information. This section presents an overview of the hierarchy, after which we define and discuss the components in detail. The hierarchy is bounded by *two constraints*: (1) **the benefits must be greater than the costs** (to justify providing the accounting information); and (2) **the dollar amount of the information must be material** (i.e., large enough to make a difference in decision making). The hierarchy is not designed to assign priorities among the qualitative characteristics in all situations. To be useful, **accounting information must have each of the qualitative characteristics to a minimum degree**. However, different situations may require tradeoffs, where the level of one quality is sacrificed for an increase in that of another quality.

### Understandability

Accounting information should be **understandable to users who have a reasonable knowledge of business and economic activities and who are willing to study the information carefully**. *Understandability* serves as a “link” between the decision makers and the accounting information. Since the FASB establishes standards for general-purpose financial statements, it is concerned that *broad classes* of decision makers are able to understand the accounting information.

6 Explain the qualities of useful accounting information.

8. The discussion in this section primarily is a summary of that presented in “Qualitative Characteristics of Accounting Information,” *FASB Statement of Financial Accounting Concepts No. 2* (Stamford, Conn.: FASB, 1980).

**EXHIBIT 2-5 Hierarchy of Qualitative Characteristics of Accounting Information**

## Decision Usefulness

**Decision usefulness is the overall qualitative characteristic to be used in judging the quality of accounting information.** Whether or not information is useful depends on the decision to be made, the way in which it is made, the information already available, and the decision maker's ability to process the information. Since the FASB establishes standards for broad classes of users, however, it must consider the quality of decision usefulness in a broad context. This overall quality can be separated into the primary qualities of relevance and reliability.

## Relevance

**Accounting information is relevant if it can make a difference in a decision by helping users predict the outcomes of past, present, and future events or confirm or correct prior expectations.** In this context, an "event" is a happening that is significant to a company (e.g., the purchase of a building). An "outcome" is the effect or result of an event or series of events (e.g., cash flows generated by use of the building). To be relevant, accounting information does not have to be expressed as a prediction. Information about a company's current resources or obligations or about its past performance commonly is used as a basis for expectations. To be relevant, accounting information should have either predictive or feedback value, or both. In addition, it should be timely.

### Predictive Value and Feedback Value

Accounting information has **predictive value** when it helps decision makers forecast more accurately the outcome of past or present events. Accounting information has **feedback value** when it enables decision makers to confirm or correct prior expectations. Often, information has both predictive value and feedback value. This is because knowledge about a company's previous actions (i.e., feedback) generally will improve a decision maker's ability to predict the results of similar future actions. An example is an interim income statement, which provides feedback about a company's income to date and can be used to forecast its annual income.

### Timeliness

Accounting information is **timely** when it is available to decision makers before it loses its ability to influence decisions. Timeliness is an ingredient of relevance. If information is not available when it is needed, it lacks relevance and is not useful. Timeliness alone cannot make information relevant, but a lack of timeliness reduces its potential relevance. However, a gain in relevance resulting from increased timeliness may involve a sacrifice of other desirable qualitative characteristics (e.g., reliability). The SEC has defined timeliness, requiring that each company under its jurisdiction file a Form 10-K annual report within 60 days of its fiscal year-end and a Form 10-Q quarterly report within 35 days of the end of each quarter.

### Reliability

Accounting information is most useful when it is reliable as well as relevant. **Reliable information is reasonably free from error and bias, and faithfully represents what it is intended to represent.** That is, to be reliable, information must be verifiable, neutral, and possess representational faithfulness. Reliability does not necessarily imply certainty or precision. For instance, estimates may be reliable. Reliability has different degrees, and what is an acceptable degree of reliability will depend on the circumstances.

### Verifiability

Accounting information is **verifiable** (sometimes called **objective**) when measurers (i.e., accountants) can agree that the selected method has been used without error or bias. That is, the measurement results can be duplicated. Verification is useful in reducing *measurer bias*, because by using the same method to repeat measurements, both unintentional and intentional errors are reduced.

Verification is a primary concern of auditing. The **Certified Public Accountant (CPA)** is an independent professional who reviews (audits) the published financial statements of a company. The performance of this duty is termed the **attest function**. It involves a review of a sample of a company's transactions during a reporting period to provide assurance that the recording and reporting of its financial information can be duplicated substantially by an independent measurer. As a result of the review, the CPA issues an auditor's report. (We discuss audit reports in Chapters 4 and 6.) Verification does not, however, ensure the appropriateness of the accounting methods used. That quality of accounting information is representational faithfulness.

### Representational Faithfulness

Accounting information has **representational faithfulness** when there is a relationship between the reported accounting measurements or descriptions and the economic resources, obligations, and transactions and events causing changes in these items. Social scientists define this concept as "validity." For instance, a company may record an item leased on a long-term basis from another entity as an economic resource even though it does not own the item. This recording increases the representational faithfulness of the reported economic resources available to the company. Having a high degree of representational faithfulness is useful in reducing *measurement bias*. Having representational

faithfulness in one decision-making context, however, does not mean that accounting information will be relevant for other decisions. For instance, the current value of an economic resource that a company expects to replace in the near future would be useful information, but it might not be useful if the company has no intention of replacing it.

### Neutrality

Accounting information is **neutral** when it is not biased to attain a predetermined result or to influence behavior in a *particular* direction. Neutrality does not mean that accounting information has no purpose or does not influence human behavior. The purpose of providing accounting information is to serve different users with many interests. Furthermore, accounting information is intended to be useful in decision making, thereby influencing the decision makers' behavior, but not in a predetermined direction. Neutrality also implies *completeness* of information. An omission of information can lead to bias if it is intended to induce or inhibit a particular behavior. Sometimes, in conjunction with neutrality, you will hear that accounting information needs to be *transparent*. Transparent accounting information is clear and not distorted, which allows external users to clearly see the information they need to make decisions.

### Comparability and Consistency

A secondary qualitative characteristic of accounting information is comparability (including consistency). Information about a company is more useful if it can be compared with similar information from other companies (this is referred to as *intercompany* comparison) or with similar information from past periods within the company (*intracompany* comparison). Comparability is not a primary quality of useful information, like relevance and reliability, because it must involve more than one item of information. It is an *interactive quality* of the relationship between two or more items of information. **Comparability of accounting information enables users to identify and explain similarities and differences between two or more sets of economic facts.**

Closely linked to comparability is consistency. **Consistency means conformity from period to period, with accounting policies and procedures remaining unchanged.** Consistency, like comparability, is a quality of the relationship between numbers rather than a quality of the numbers themselves. Consistency helps enhance comparability across periods. Without consistency, it would be difficult for a user to determine whether differences in results were caused by economic differences or simply by differences in accounting methods. On the other hand, a change in accounting method is sometimes desirable. Economic situations may change, or more preferable new accounting methods may evolve. A company must make some sacrifice in consistency at certain times to improve the usefulness of its accounting information.

### Constraints to the Hierarchy

Two constraints to the hierarchy of qualitative characteristics help to identify further what accounting information should be disclosed in financial reports. The first is a benefit/cost constraint; the second is a threshold-for-recognition, or materiality, constraint.

### Benefits Greater Than Costs

Accounting information is a commodity. Unless the benefits expected to be received from a commodity exceed its costs, the commodity will not be sought after. The preparer (the company) initially incurs the costs of providing financial information and then passes the costs on to consumers (external users). These costs include the cost of collecting, processing, auditing, and communicating the information. The costs also include those associated with losing a competitive advantage by disclosing the information. The benefits are enjoyed by a diverse group of investors and creditors, by customers (because they are assured a steady supply of goods and services), and by the preparer itself (for use in internal decision

making). To be reported, accounting information not only must be relevant and reliable but it also must satisfy the benefit/cost constraint. That is, the FASB must have reasonable assurance that the costs of implementing a standard will not exceed the benefits.

### Materiality

The second constraint, that of materiality, is really a *quantitative* “threshold” constraint linked very closely to the qualitative characteristic of relevance. **Materiality refers to the magnitude of an omission or misstatement of accounting information that makes it likely the judgment of a reasonable person relying on the information would have been influenced by the omission or misstatement.** Materiality and relevance are both defined in terms of the influences that affect a decision maker, but there is a difference between the two terms. A company may make a decision to disclose certain information because users have a need for that information (it is relevant) *and* because the amount is large enough to make a difference (it is material). Alternatively, a decision not to disclose certain information may be made because the user has no need for the information (it is not relevant) *or* because the amount is too small to make a difference (it is not material).

The FASB did not set overall quantitative guidelines for materiality in the *Statements of Concepts*. It felt that materiality involves judgment, and that no general standards could be set that took into account all the elements of sound human judgment. Materiality judgments should be concerned with thresholds of recognition. Is an item large enough to pass over the threshold that separates material from immaterial items? To answer that question, the FASB suggested that a company give consideration to:

- the *nature* of the item (i.e., items considered too small to be significant when they result from routine transactions might be material if they arose from abnormal circumstances)
- the *relative size* rather than absolute size of an item (i.e., a \$10,000 error in inventory of a large company may be insignificant while a similar \$10,000 error by a small company may be material)

The FASB observed that quantitative guidelines have been and will continue to be set for specific accounting issues where appropriate.

In regard to the relative size of a misstatement, some companies establish an initial percentage threshold; for instance, 5% of net income for the income statement and 5% of total assets for the balance sheet. Thus, if the misstatement of an amount is less than 5% of net income it is not considered material for the income statement. External users feel that some companies are using a percentage threshold as an “absolute” cutoff without considering the qualitative factors of the information, such as the surrounding circumstances or the “total mix” of information. In response, several groups (the SEC, the AICPA, and the Big Five Audit Materiality Task Force) have provided guidance in assessing the materiality of a misstated item for a company. These include, for instance, whether the misstatement:

- has an effect on trends (particularly trends in profitability)
- masks a change in earnings (and earnings per share)
- is currently immaterial but may have a material impact in future periods because of a cumulative effect
- changes a loss into net income (or vice versa)
- misrepresents the company’s compliance with loan agreements
- relates to a segment of the company that is of particular importance to the company’s long-run profitability
- has the effect of increasing management’s compensation.<sup>9</sup>

9. For a more extensive discussion, see “Materiality,” *SEC Staff Accounting Bulletin No. 99* (Washington, D.C.: Securities and Exchange Commission, August 12, 1999) and “Audit Risk and Materiality in Conducting an Audit,” *AICPA Professional Standards*, Volume 1 (New York: AICPA, 2004), sec. 312.

Thus, companies may use a quantitative threshold as an initial step in assessing materiality, but need to consider qualitative factors in making the final judgment on the materiality of an item.

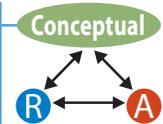

## SECURE YOUR KNOWLEDGE 2-2

- For accounting information to be useful for decision making, it must be understandable to users who possess a reasonable knowledge of business and economic activities and who are willing to study the information with reasonable diligence.
- The primary qualities that make accounting information useful for decision making are relevance and reliability.
  - Relevant information is available in a timely manner and assists users in predicting the outcome of past, present, or future events or confirming prior expectations.
  - Reliable information is reasonably free from error and bias, and faithfully represents what it is intended to represent.
- External decision makers need accounting information that is comparable across different companies and consistent within a company over time.
- Two constraints on the qualitative characteristics of accounting information are:
  - The costs of providing the information should not exceed the benefits received from the using the information; and
  - The information should be material (capable of influencing a decision).

## ACCOUNTING ASSUMPTIONS AND PRINCIPLES

Certain accounting assumptions and principles have had an important impact on the development of GAAP. Exhibit 2-6 is useful in understanding the relationship among the objectives, types of useful information, qualitative characteristics, accounting assumptions and principles, generally accepted accounting principles, financial reports, and elements of financial statements. We discuss the accounting assumptions and principles listed in Exhibit 2-6 in this section. We will discuss others later in the book as they apply to specific accounting standards.

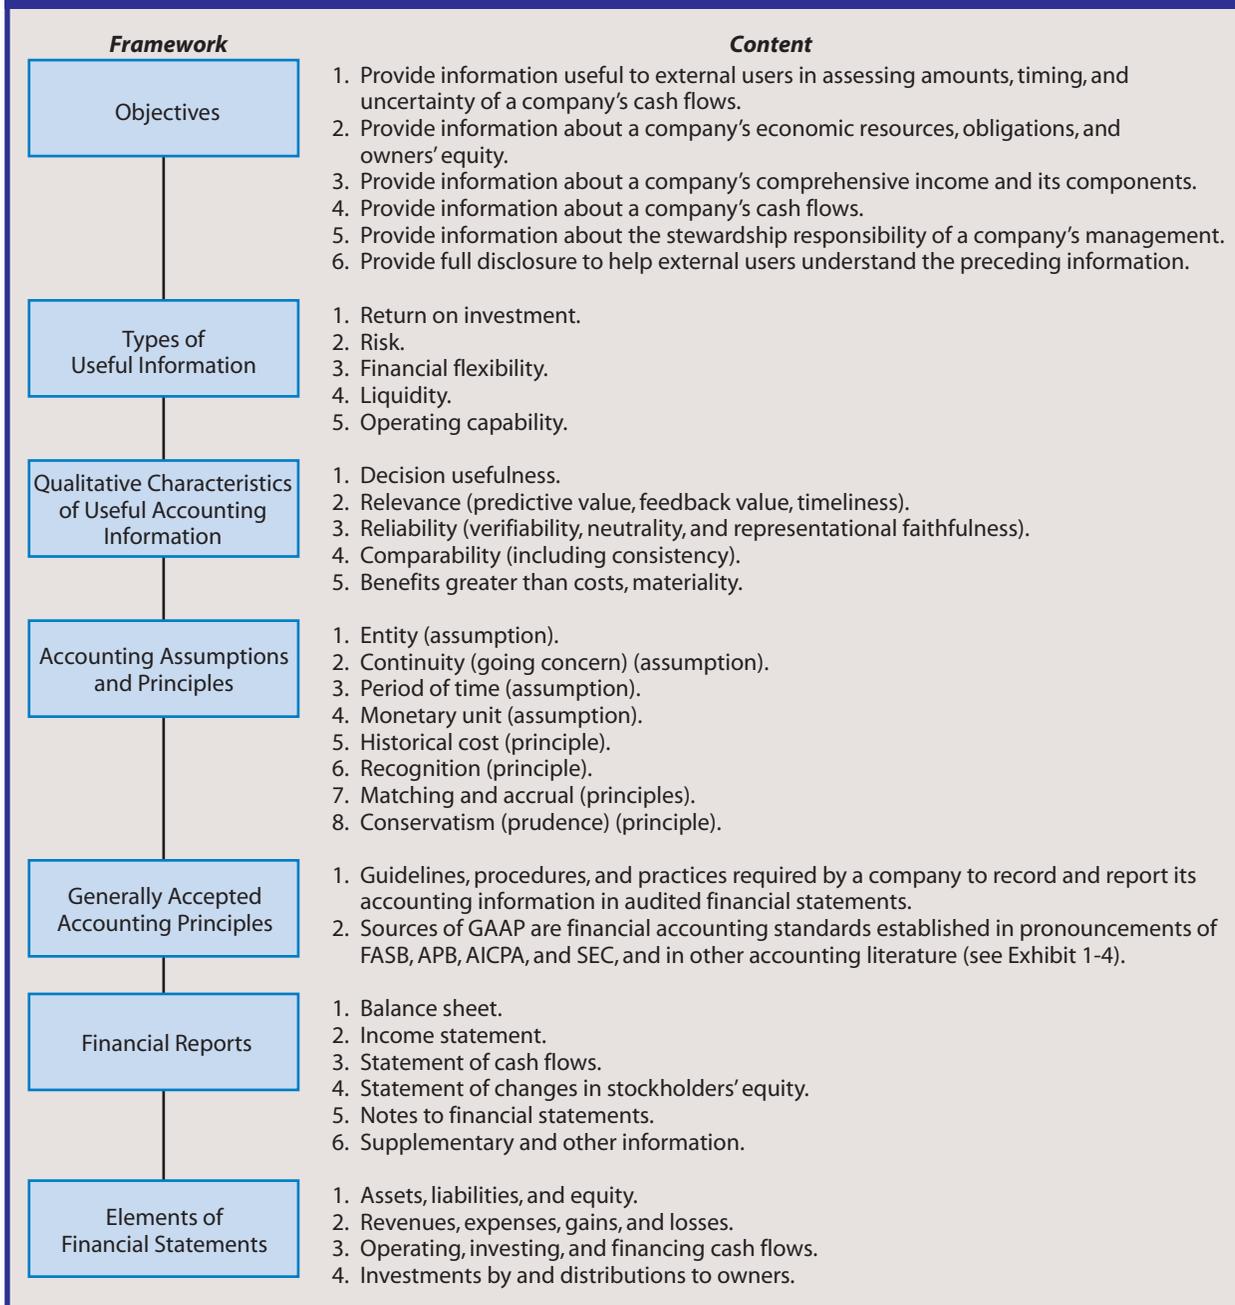

**7** Understand the accounting assumptions and principles that influence GAAP.

### Entity (Assumption)

Most of the economic activity in the United States can be directly or indirectly attributed to business enterprises, termed **economic entities**. These entities vary in size from small, one-owner companies such as hair salons or restaurants, to partnerships such as law or accounting firms, and to large multinational corporations such as **Wal-Mart**. Financial accounting is concerned with the economic activity of each of these entities, regardless of its size, and involves recording and reporting its transactions and events. A transaction involves the transfer of something of value between the entity and another party. In certain instances the financial records of related but separate legal entities may be *consolidated* (combined) to report more realistically the resources, obligations, and operating results of the overall economic entity.

Because the entity assumption distinguishes each organization from its owners, each separate entity prepares its own financial records and reports. The personal transactions of the owners are kept separate from those of the business enterprise. Throughout this book we refer to a business enterprise as a *company* (and when the discussion applies to a type of company, we use the specific type of entity, e.g., *corporation*).

**EXHIBIT 2-6 Framework of Financial Accounting Theory and Practice**

**Continuity (Assumption)**

The **continuity assumption** is also known as the **going-concern assumption**. This assumption is that the company will continue to operate in the near future, unless substantial evidence to the contrary exists. Obviously, not all companies are successful, and failures do occur. However, the continuity assumption is valid in most cases and is necessary for many of the accounting procedures used. For example, if a company is not regarded as a going concern, the company should not depreciate its fixed assets over their expected useful lives, nor should the company record its inventory at its cost, because the receipt of future economic benefits from these items is uncertain.

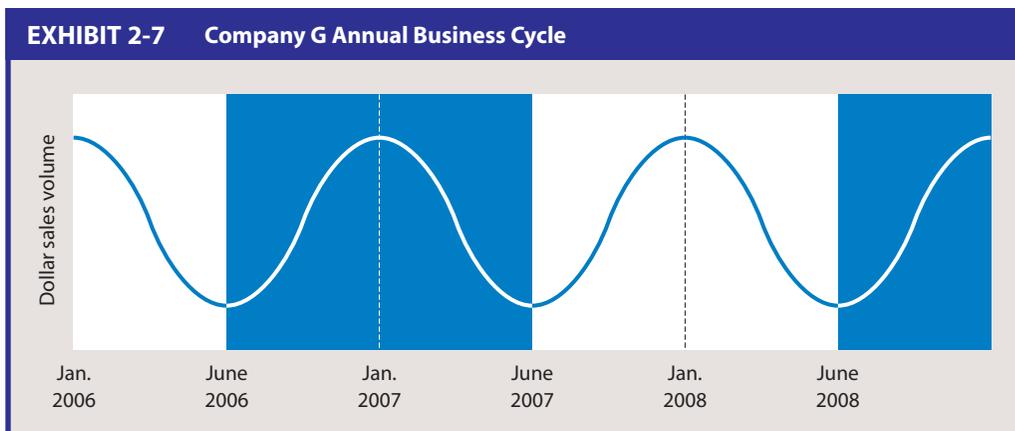

The continuity assumption does not imply permanence. It simply indicates that the company will operate long enough to carry out its existing commitments. If a company

appears to be going bankrupt, it must discard the continuity assumption. The company then reports its financial statements on a liquidation basis, with all assets and liabilities valued at the amounts estimated to be collected or paid when they are sold or liquidated.

### Period of Time (Assumption)

The profit or loss earned by a company cannot be determined *accurately* until it stops operating. At that time the total lifetime profit or loss may be determined by comparing the cash on hand after liquidating the business (plus any cash payments to the owners during the period of operations) with the amount invested by the owners during the company's lifetime. Obviously, financial statement users need more current information to evaluate a company's profitability. Companies primarily use a year as the reporting period. In accordance with the **period-of-time assumption**, a company prepares financial statements at the end of each year and includes them in its annual report. Furthermore, the annual reporting period (called the **accounting period** or **fiscal year**) is used for reports issued to government regulators such as the Internal Revenue Service (IRS) and the Securities and Exchange Commission (SEC).

The period-of-time assumption is the basis for the adjusting entry process in accounting. If companies did not prepare financial statements on a yearly (or shorter time) basis, there would be no reason to determine the time frame affected by particular transactions. Historically, most companies adopted the calendar year as the accounting period. However, many companies now choose a fiscal year that more closely approximates their annual *business cycle*. (The yearly period from lowest sales through highest sales and back to lowest sales is known as a business cycle.) For example, consider Exhibit 2-7, which shows the annual sales pattern for Company G. Notice that peak sales occur each year in January, while the lowest sales volume occurs in June. A company that sells ski equipment might have such a sales pattern. If Company G were to report on a calendar-year basis, its financial reports would be prepared at about the time of peak yearly sales (i.e., the midpoint of the business cycle). Alternatively, a fiscal year that ended on June 30 would include a single complete annual business cycle. Many large retail chains have a fiscal year-end that follows the peak Christmas selling season. For example, Wal-Mart's year-end is January 31, which is after most of the returns and allowances related to those sales have occurred. Fiscal-year reports that include an annual business cycle contain information that is more easily comparable to past and future periods because annual sales patterns are not broken by the reporting period.

In addition to annual reports, publicly traded companies issue financial statements for interim (quarterly) periods. These interim periods are integral parts of the annual period, and interim reports disclose summary information to provide investors with more timely information.

## Monetary Unit (Assumption)

Since the time when gold and other precious metals were accepted in exchange for goods and services, there has been a unit of exchange. This unit of exchange is different for almost every nation. Accountants generally have adopted the national currency of the reporting company as the unit of measure in preparing financial statements.

In using the dollar or any other currency as the unit of measure, accountants traditionally have assumed that it is a stable measuring unit. Prior to the FASB, accounting policy-making bodies had felt that fluctuations in the value of the dollar were not a serious enough problem to affect the comparability of accounting information. Therefore, any adjustment in the monetary unit assumption was not needed.

In today's world the assumption that the dollar or any other national currency is a stable measure over time is not necessarily valid. Consider the building you are now in. If you were to measure its width in feet and inches today, next year, and five years from now, an accurate physical measurement would yield the same results each time. In contrast, consider the monetary value of the same building. Real estate prices have changed (increased or decreased) during the past several years and undoubtedly will continue to vary, resulting in changing monetary measures of value even though the physical capacity remains the same.

There are two primary reasons for changes in reported values over time:

1. The real value of the item in question may change in relation to the real value of all other goods and services in the economy.
2. The purchasing power of the measuring unit (in this case the dollar) may change.

Currently the dollar is considered to be a stable monetary unit for preparing a company's financial statements. As we mentioned earlier, however, to enhance comparability the FASB encourages companies to make supplemental disclosures relating to the impacts of changing prices.

## Historical Cost (Principle)

The economic activities and resources of a company initially are measured using the exchange price at the time each transaction occurs. For many economic resources, usually the company retains the exchange price (the **historical cost**) in its accounting records as the value of the resource until the company consumes or sells it and removes it from the records. That is, a company usually delays recording gains and losses resulting from value changes of assets (or liabilities) until another exchange occurs. The reason for using historical cost (as opposed to other valuation methods such as current market value or appraisal value) is that it is reliable, and that source documents usually are available to confirm the recorded amount. Also, historical cost provides evidence that an independent buyer and seller were in agreement on the value of an exchanged good or service at the time of the transaction and thus has the qualities of representational faithfulness, neutrality, and verifiability.

One of the most frequently heard criticisms of accounting comes from those who prefer alternative valuation methods that they believe would report information more relevant for user decisions. Accountants understand that historical cost information may not always be completely *relevant* for all decisions, but it does have a significant degree of *reliability*. In certain cases accounting standards require the use of valuation methods other than historical cost to report the *fair value* of selected items in the financial statements. These methods are required when they provide more relevant information and possess an acceptable degree of reliability.<sup>10</sup> However, it is often felt that the measurement problems

---

10. See, for instance, "Fair Value Measurements," *FASB Proposed Statement of Financial Accounting Standards* (Norwalk, Conn.: FASB, 2004).

inherent in alternative valuation methods are greater than those of historical cost. That is, reliability often takes precedence over relevance. The FASB, however, understands the significance of this relevance/reliability tradeoff and encourages companies to disclose *supplemental* current value information in their annual reports. Also, you should understand that when a company changes the values of its assets and liabilities the company must include these value changes in its comprehensive income for the period. We discuss valuation methods in Chapter 4.

## LINK TO ETHICAL DILEMMA

You have been hired as an accounting consultant to review the financial reporting policies of Parker Company as it enters merger negotiations with an interested buyer. Of particular interest is the way in which Parker Company accounts for its property, plant, and equipment. As rumors of possible mergers began several years ago, the company's management periodically began using independent valuation experts to determine fair market values for the company's net assets. As a result of these analyses, management was able to determine that its long-term productive assets had book values that were significantly less than their market values. Citing the increased reliability provided by the valuation experts, management decided to write the company's assets up to market value to provide investors and creditors with the most relevant information possible and to be consistent with the FASB's increasing use of fair value measurements. Do you agree with this decision?

### Recognition (Principle)

**Recognition** means the process of formally recording and reporting an item in the financial statements of a company. A recognized item is shown in both words and numbers, with the amount included in the financial statement totals. The FASB has identified four fundamental recognition criteria. To be recognized, an item must:

- meet the definition of an element
- be measurable
- be relevant
- be reliable

In regard to revenues, two other factors provide guidance for revenue recognition. Revenues should be recognized when (1) realization has taken place, and (2) they have been earned. These factors provide acceptable assurance of the existence and amounts of revenues.

A company usually recognizes revenue at the time of sale because this is when realization occurs and its earning process is substantially complete. **Realization** means the process of converting noncash resources and rights into cash or rights to cash; that is, when the company receives cash or obtains a receivable. Actually, revenue is earned by a company throughout the earning process as it adds economic utility to goods. This **earning process** includes acquisition, production and/or distribution, sales, and the collection and payment of cash. A company could recognize revenue at one or more points in this process. In this regard, the FASB suggests that revenues are considered to be earned when a company has

substantially completed what it must do to be entitled to the benefits (i.e., assets) generated by the revenues. Usually, this is the point of sale.<sup>11</sup>

Occasionally a company may advance (accrue) or delay (defer) the recognition of revenue in the earning process to increase the relevance of its income statement. Thus, a company may not recognize (record) revenue at the same time as realization. A company might recognize revenue (1) during production, (2) at the end of production, or (3) after the sale. In the case of certain long-term construction contracts extending over more than one accounting period, a company usually recognizes revenue during production to better depict economic reality by the use of the **percentage-of-completion** method. Similarly, revenue usually is recognized for certain long-term service contracts by use of the **proportional performance** method. These methods allocate the revenues of each contract to each period, based on an estimate of the percentage completed during the period. We discuss these revenue recognition methods in Chapters 5 and 8.

A company might recognize revenue at the completion of production if there is a fixed selling price and there is no limit on the amount that it can sell. This situation might be the case for certain valuable minerals or for farm products sold on the futures market. Finally, revenue may be recognized after the sale if the ultimate collectibility of the revenue is highly uncertain. This situation might arise, for instance, in the case of real estate land sales where a very small down payment is required and the payment terms extend over many years. In situations of high uncertainty about collections, a company uses either the installment or the cost-recovery method to recognize revenue. Under the **installment** method, a portion of each receipt is recognized as revenue. Under the **cost-recovery** method, no revenue is recognized until the cost of the product has been recovered.

### Matching and Accrual Accounting (Principles)

Earlier, **accrual accounting** was defined as the process of relating the financial effects of transactions, events, and circumstances having cash consequences to the period in which they occur instead of to when the cash receipt or payment occurs. The **matching** principle is linked closely to accrual accounting and to revenue recognition. The matching principle states that to determine the income of a company for an accounting period, the company computes the total expenses involved in obtaining the revenues of the period and relates these total expenses to (matches them against) the total revenues recorded in the period. Thus, some expenses are advanced (accrued) or delayed (deferred) in a manner similar to revenues. The intent is to match the sacrifices against the benefits (i.e., the efforts against the accomplishments) in the appropriate accounting period.

A company recognizes and matches expenses against revenues on the basis of three principles:

- association of cause and effect
- systematic and rational allocation
- immediate recognition

Expenses recorded as a result of associating cause and effect include sales commissions and the **product costs** included in cost of goods sold. Expenses recorded on the basis of systematic and rational allocation include depreciation of property and equipment and amortization of intangibles. Immediate recognition is appropriate for **period costs**—those expenses related to a period of time, such as administrative salaries.<sup>12</sup>

Some smaller companies do not use accrual accounting and matching. Instead they use **cash basis** accounting for simplicity. In cash basis accounting, a company computes

11. "Recognition and Measurement in Financial Statements of Business Enterprises," *FASB Statement of Financial Accounting Concepts No. 5* (Stamford, Conn.: FASB, 1984), par. 63 and 83.

12. "Elements of Financial Statements," *FASB Statement of Financial Accounting Concepts No. 6* (Stamford, Conn.: FASB, 1985), par. 146–149.

its income for an accounting period by subtracting the cash payments from the cash receipts from operations. While this method may be convenient to use, it can lead to incorrect evaluations of a company's operating results. This may happen because the receipt and payment of cash may occur much earlier or later than the sale of goods or the providing of services to customers (benefits) and the related costs (sacrifices). Because cash basis accounting does not attempt to match expenses against revenues, it is not a generally accepted accounting principle.

### Conservatism (Principle)

The principle of **conservatism** states that when alternative accounting valuations are equally possible, the accountant should select the one that is least likely to overstate the company's assets and income in the current period. Over the years conservatism gained prominence because of the optimism of management and the tendency, during the first three decades of the twentieth century, to overstate assets and net income on financial statements. Recently, conservatism has been criticized for being "anticonservative" in the years following the conservative act. That is, a deliberate understatement of an asset with a corresponding loss and understatement of income in one year will result in an overstatement of income in a later year when the asset is sold because of the greater difference between the selling price and lower recorded value of the asset. Furthermore, conservatism can conflict with qualitative characteristics such as neutrality. For instance, conservative financial statements may be unfair to present stockholders and biased in favor of future stockholders because the net valuation of the company does not include some future expectations. This factor may result in a relatively lower current market price of the company's common stock. These criticisms notwithstanding, conservatism has played an important role in the establishment of certain generally accepted accounting principles.

The FASB has attempted to modify the principle of conservatism so that it is more synonymous with **prudence**. That is, conservatism should be a prudent reaction to uncertainty so as to ensure, to the extent possible, that the uncertainties and risks inherent in business situations are adequately considered. These uncertainties and risks should be reflected in accounting information to improve its predictive value and neutrality. Prudent reporting based on a healthy skepticism promotes integrity and best serves the various users of financial reports.<sup>13</sup>

## GAAP AND FINANCIAL STATEMENTS

As we noted in Chapter 1, generally accepted accounting principles (GAAP) are the guidelines, procedures, and practices that a company is required to use in recording and reporting its accounting information in its audited financial statements. In its *Conceptual Framework*, the FASB has identified various sources from which investors, creditors, and other users might obtain information useful in decision making. Exhibit 2-8 shows this model of financial reporting. We discuss components of this model in Chapters 4, 5, and 23.

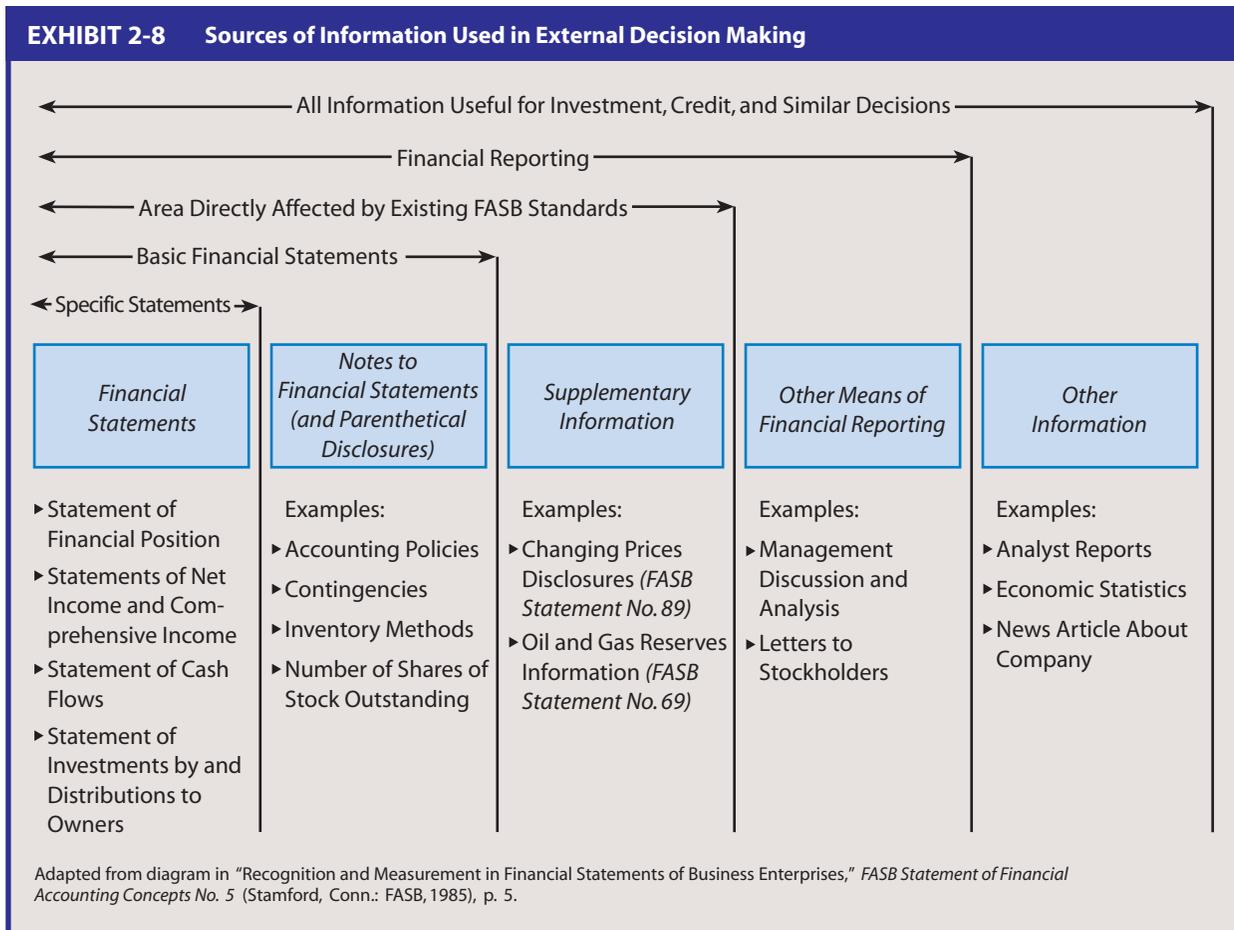

Conceptually, the FASB identified the four specific financial statements listed in Exhibit 2-8. In practice, companies prepare at least three major financial statements: (1) the balance sheet (statement of financial position), (2) the income statement, and (3) the statement of cash flows. Many companies also prepare a statement of changes in equity as a major financial statement (or in a note to the financial statements).<sup>14</sup> In this section we discuss briefly these financial statements and the elements of the financial

8 Define the elements of financial statements.

13. FASB *Statement of Financial Accounting Concepts No. 2, op. cit.*, par. 95–97.

14. Each company also must report its comprehensive income and may choose to do so on its income statement, a statement of comprehensive income, or on its statement of changes in stockholders' equity. We will discuss these alternatives in Chapter 5.

statements. The elements of each financial statement are the broad classes of items comprising it. In other words, they are the “building blocks” with which each financial statement is prepared.<sup>15</sup> We discuss the financial statements and their elements in more depth in later chapters.

### Balance Sheet

A **balance sheet** (or statement of financial position) is a financial statement that summarizes the financial position of a company on a particular date (usually the end of the accounting period). The financial position of a company includes its economic resources, economic obligations, and equity, and their relationships to each other. There are three elements of a balance sheet:

1. **Assets:** Assets are the probable future economic benefits obtained and controlled by a company as a result of past transactions or events.
2. **Liabilities:** Liabilities are the probable future sacrifices of economic benefits arising from present obligations of a company to transfer assets or provide services in the future as a result of past transactions or events.
3. **Equity:** Equity is the owners’ residual interest in the assets of a company that remains after deducting its liabilities.

15. The discussion in this section primarily is a summary of that presented in “Elements of Financial Statements of Business Enterprises,” *FASB Statement of Financial Accounting Concept No. 6* (Stamford, Conn.: FASB, 1985) and “Statement of Cash Flows,” *FASB Statement of Financial Accounting Standards No. 95* (Stamford, Conn.: FASB, 1987).

In other words, the assets of a company are its economic resources, and the liabilities are its economic obligations. The equity of a corporation is referred to as stockholders' equity because the owners are the stockholders.

## Income Statement

An **income statement** is a financial statement that summarizes the results of a company's operations (i.e., net income) for a period of time (generally a one-year or one-quarter accounting period). A company's operations (sometimes called the earning process) include its purchasing, producing, selling, delivering, servicing, and administrating activities. There are four elements of an income statement:

1. **Revenues:** Revenues are inflows of assets of a company or settlement of its liabilities (or a combination of both) during a period from delivering or producing goods, rendering services, or other activities that are the company's ongoing major or central operations. Revenues increase the equity of a company.
2. **Expenses:** Expenses are outflows of assets of a company or incurrences of liabilities (or a combination of both) during a period from delivering or producing goods, rendering services, or carrying out other activities that are the company's ongoing major or central operations. Expenses decrease the equity of a company.
3. **Gains:** Gains are increases in the equity of a company from peripheral or incidental transactions, and from all other events and circumstances during a period, except those that result from revenues or investments by owners.
4. **Losses:** Losses are decreases in the equity of a company from peripheral or incidental transactions, and from all other events and circumstances during a period, except those that result from expenses or distributions to owners.

Revenues may be thought of as measures of the accomplishments of a company during its accounting period, while expenses are measures of the efforts to achieve the revenues. Gains are similar to revenues and losses are similar to expenses, except that revenues and expenses relate to a company's primary operations, while gains and losses relate to its secondary activities.

## Statement of Cash Flows

A **statement of cash flows** is a financial statement that summarizes the cash inflows and outflows of a company for a period of time (generally one year or one quarter). There are three elements of a statement of cash flows:

1. **Operating Cash Flows:** Operating cash flows are the inflows and outflows of cash from acquiring, selling, and delivering goods for sale, as well as providing services.
2. **Investing Cash Flows:** Investing cash flows are the inflows and outflows of cash from acquiring and selling investments, property, plant, and equipment, and intangibles, as well as from lending money and collecting on loans.
3. **Financing Cash Flows:** Financing cash flows are the inflows and outflows of cash from obtaining resources from owners and paying them dividends, as well as obtaining and repaying resources from creditors on long-term credit.

In addition to these three elements, the statement of cash flows reconciles the amount of cash a company reports on its balance sheets at the beginning and end of the accounting period.

## Statement of Changes in Equity

A **statement of changes in equity** summarizes the changes in a company's equity for a period of time (generally one year or one quarter). For a corporation, the statement is called the statement of changes in stockholders' equity. There are two elements in a statement of changes in equity:

1. **Investments by Owners:** Investments by owners are increases in the equity of a company resulting from transfers of something valuable (usually cash) to the company in order to obtain or increase ownership interests.
2. **Distributions to Owners:** Distributions to owners are decreases in the equity of a company caused by transferring assets, rendering services, or incurring liabilities.

In addition to these elements, the statement of changes in equity also reconciles the amounts of the equity items a company reports on its beginning and ending balance sheets for such items as net income and other comprehensive income.

### Model of Business Reporting

The AICPA Special Committee on Financial Reporting issued a report that addressed concerns about the relevance and usefulness of reporting by companies. In this report the committee developed a comprehensive model of *business reporting*—the information that a company provides to help users with capital allocation decisions about the company. The model was designed to help focus attention on a broader, integrated range of information than that addressed in the FASB's conceptual framework. The goal was to provide the foundation for future improvement in business reporting. The model includes 10 items within five categories of information. These categories are designed to fit the decision processes of users to make projections, value companies, or assess the likelihood of loan repayments. The framework of the model is as follows:

1. *Financial and nonfinancial data* including (a) financial statements and related disclosures and (b) high-level operating data and performance measurements that a company's management uses to manage the business.
2. *Management's analysis of the financial and nonfinancial data*, including (a) reasons for changes in the financial, operating, and performance-related data and (b) the identity and past effect of key trends.
3. *Forward-looking information*, including (a) the assessment of opportunities and risks, including those resulting from key trends, (b) management's plans, including critical success factors, and (c) a comparison of actual business performance to previously disclosed opportunities, risk, and management's plans.
4. *Information about management and shareholders*, including (a) directors, management, compensation, and major shareholders and (b) transactions and relationships among related parties.
5. *Background about the company*, including (a) broad objectives and strategies, (b) scope and description of the company's business and properties, and (c) the impact of industry structure on the company.

The model is responsive to users' needs, but includes practical constraints to balance the costs and benefits of reporting. Since the AICPA committee is not a standard-setting body, the model is a recommendation to standard setters who have an interest in improving the cost-effective quality of business reporting.<sup>16</sup> We discuss components of this model in Chapters 4, 5, and 6.

16. "Improving Business Reporting—A Customer Focus," *AICPA Special Committee on Financial Reporting* (New York: AICPA, 1994), pp. 2–9.

## SECURE YOUR KNOWLEDGE 2-3

- Four basic assumptions underlie GAAP. These are:
  - The entity assumption, which relates economic activities to a particular economic entity;
  - The continuity (going concern) assumption, which states that with no evidence to the contrary, a company will continue to operate in the near future;
  - The period of time assumption which allows the life of a company to be divided into artificial time periods and serves as the basis for the adjusting entry process; and
  - The monetary unit assumption, which requires financial statement elements to be expressed in terms of the dollar.
- Four broad principles have greatly influenced the development of GAAP. These are:
  - The historical cost principle, which provides highly reliable, although not always the most relevant, information by measuring economic activities at their historical exchange price;
  - The recognition principle, which determines when an item is to be reported in the financial statements (revenue recognition usually occurs when revenue is realized and the earnings process is complete);
  - The matching principle, which applies accrual accounting by stating that expenses should be recognized in the same period as the related revenues; and
  - The conservatism principle, which states that when given alternative accounting valuations, the accountant should select the one that is least likely to overstate current period assets and income.
- The FASB identified four basic financial statements (the balance sheet, the income statement, the statement of cash flows, and the statement of changes in stockholders' equity) as sources of useful information.

## IASB FRAMEWORK

The International Accounting Standards Board (IASB) has issued a **Framework for the Preparation and Presentation of Financial Statements** that is similar, in many respects, to the FASB Conceptual Framework.

The IASB Framework states that the objective of financial statements is to provide information about the financial position, performance, and changes in financial position of a company that is useful to a wide range of users in making economic decisions. The Framework has two underlying assumptions; that a company is a going concern and uses accrual accounting. It identifies four qualitative characteristics of financial statements—understandability, relevance (including materiality), reliability (including faithful presentation, substance over form, neutrality, prudence, and completeness), and comparability. Three constraints on relevant and reliable information are identified; they include timeliness, balance between benefit and cost, and balance between the qualitative characteristics. The Framework calls for financial statements that present a true and fair view of the company and a fair presentation of the company's activities.

The IASB Framework identifies and defines the elements of a statement of financial position (i.e., assets, liabilities, and equity) and a statement of performance (i.e., income and expenses). It also discusses conceptual issues dealing with the recognition of the elements of financial statements, measurement of the elements, and concepts of capital and capital maintenance.

The IASB Framework is designed (1) to help the Board in developing future International Accounting Standards and reviewing existing Standards and (2) to promote the harmonization of regulations, accounting standards, and accounting procedures regarding the preparation of financial statements.<sup>17</sup>

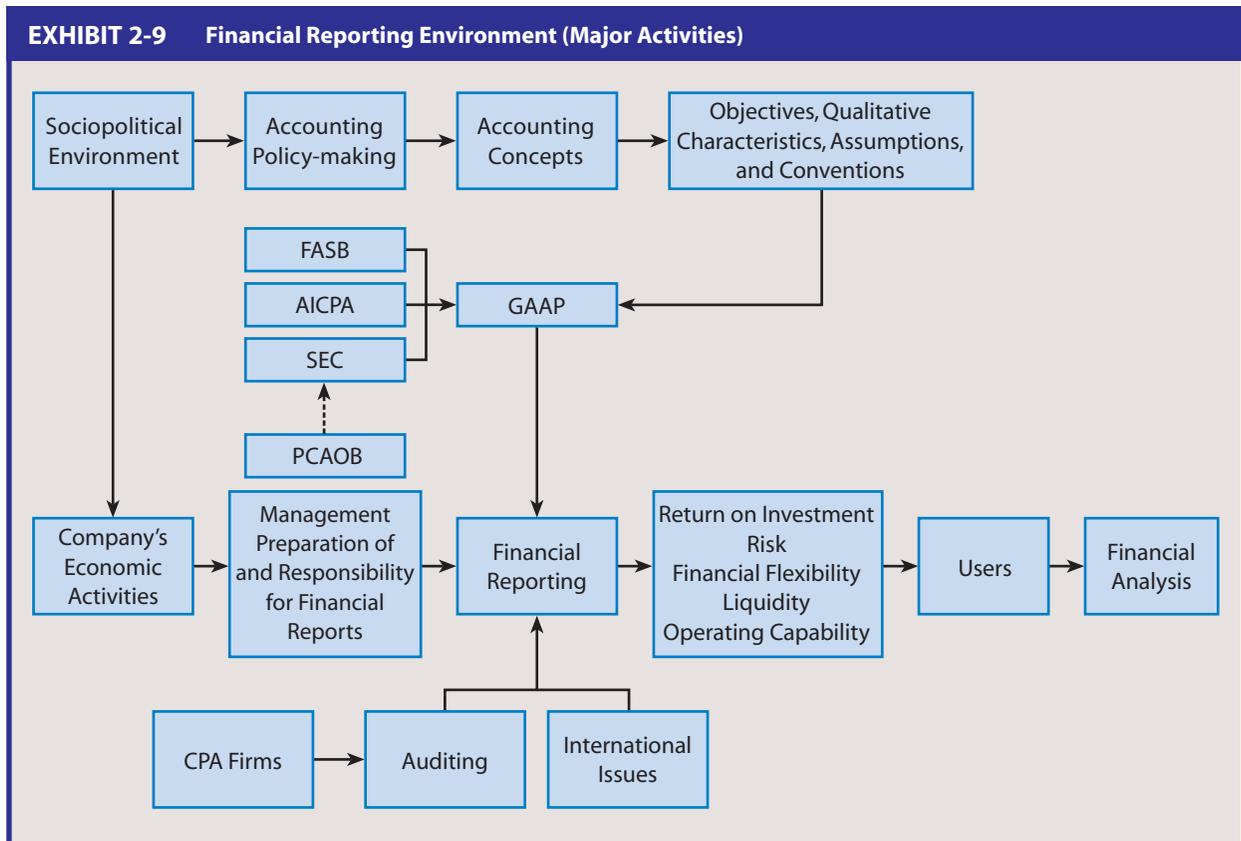

In 2004, the FASB and the IASB added to their respective agendas a project to develop a common conceptual framework that is based on, and builds on, their existing frameworks. The Boards will focus on issues that are more likely to yield near term standard-setting benefits and cut across several current standard-setting projects. Issues relating to the definitions of assets and liabilities, historical cost versus fair value measurements, and relevance versus reliability will all be key concerns as the conceptual framework project progresses. In addition to promoting international harmonization of future accounting standards, the end result of this project should provide a more consistent and unified set of concepts that will result in accounting standards that are principles-based.

## OVERVIEW

We discuss the financial statements and their elements, as they fit into the FASB's model of financial reporting and the AICPA's model of business reporting in depth in the later chapters of this book. In addition, we discuss supplementary schedules and notes to the financial statements, along with various recognition and measurement issues. As you read the discussions, it may be helpful for you to place them in the context of the *FASB Conceptual Framework* as we summarized in Exhibit 2-6, as well as the financial reporting environment as we summarize in Exhibit 2-9.

---

17. For further discussion, go to *International Accounting Reporting Standards* (London: IASCF, 2004).

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

1. **Explain the FASB conceptual framework.** The FASB conceptual framework is a theoretical foundation of interrelated objectives and concepts that leads to the establishment of consistent financial accounting standards. It provides a logical structure and direction to financial accounting and reporting.
2. **Understand the relationship among the objectives of financial reporting.** The FASB conceptual framework consists of four levels of objectives that proceed from the more general to the more specific. The top level is the general objective of financial reporting, the next level is the derived external user objective, the third level is the derived company objective, and the final level includes the specific objectives.
3. **Identify the general objective of financial reporting.** The general objective states that financial reporting should provide useful information for present and potential investors, creditors, and other external users in making their investment, credit, and similar decisions.
4. **Describe the three specific objectives of financial reporting.** The three specific objectives are to provide information about a company's: (1) economic resources, obligations, and owners' equity; (2) comprehensive income and its components; and (3) cash flows.

5. **Discuss the types of useful information for investment and credit decision making.** For investment and credit decision making, a company's financial reports should provide useful information about its return on investment, risk, financial flexibility, liquidity, and operating capability.
6. **Explain the qualities of useful accounting information.** Accounting information should be understandable and have decision usefulness. The two primary decision-specific qualities are relevance and reliability. To be relevant, accounting information must have predictive value, feedback value, and timeliness. To be reliable, it must have verifiability, representational faithfulness, and neutrality. In addition, accounting information should be comparable and consistent. Two constraints in preparing and reporting accounting information are that the benefits must be greater than the costs of preparing the information and that the information must be material.
7. **Understand the accounting assumptions and principles that influence GAAP.** Certain assumptions and principles play an important role in the development of GAAP. These include the entity, continuity (going-concern), accounting period, historical cost, monetary unit, recognition and realization, accrual accounting and matching, and conservatism (prudence) assumptions and principles.
8. **Define the elements of financial statements.** The elements of each financial statement are the broad classes of items comprising it. For a balance sheet, the elements are assets, liabilities, and equity. For an income statement, they are revenues, expenses, gains, and losses. For a statement of cash flows, they are operating, investing, and financing cash flows. For a statement of changes in equity, they are investments by and distributions to owners.

## QUESTIONS

- Q2-1** What is the "conceptual framework" of the FASB? What are the titles of the *Statements of Concepts* issued by the FASB?
- Q2-2** What is the most general objective of financial reporting? Who are investors and creditors?
- Q2-3** What is the "derived external user objective" and why is it important?
- Q2-4** What is the "derived company objective" and what types of information about a company should be reported to satisfy this objective?
- Q2-5** List the reasons why external users use information about a company's (a) economic resources and claims to these resources, (b) comprehensive income and its components, and (c) cash flows.
- Q2-6** Define (a) return on investment, (b) risk, (c) financial flexibility, (d) liquidity, and (e) operating capability.
- Q2-7** What is the overall qualitative characteristic of useful accounting information and what are its two primary qualities?
- Q2-8** What is relevant accounting information? Identify and define the ingredients of relevant accounting information.
- Q2-9** What is reliable accounting information? Identify and define the ingredients of reliable accounting information.
- Q2-10** Identify the secondary quality of useful accounting information. Why is this important and how does it relate to consistency?
- Q2-11** What is materiality and how does it relate to relevance?
- Q2-12** What is the continuity assumption and why is it important in financial accounting?
- Q2-13** What is the period-of-time assumption and why is it important in financial accounting?
- Q2-14** Discuss the relationship between historical cost and reliability.
- Q2-15** What is recognition? What is realization? What two factors provide guidance for revenue recognition? Why is revenue usually recognized at the time of sale?
- Q2-16** What is accrual accounting and how does it relate to the matching principle?
- Q2-17** List the three principles for matching expenses against revenues.
- Q2-18** What is conservatism and how might it conflict with neutrality?
- Q2-19** Define a balance sheet and list its three elements.
- Q2-20** Define an income statement and list its four elements.
- Q2-21** Define a statement of cash flows and list its three elements.
- Q2-22** Define a statement of changes in equity and list its two elements.
- Q2-23** For the IASB Framework, list the objective of financial statements and identify the underlying assumptions, qualitative characteristics, and constraints.

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

**M2-1** Accruing net losses on non-cancelable purchase commitments for inventory is an example of the accounting concept of

- a. Conservatism
- b. Realization
- c. Consistency
- d. Materiality

**M2-2** The information provided by financial reporting pertains to

- a. Individual companies, rather than to industries or the economy as a whole or to members of society as consumers.
- b. Individual companies and industries, rather than to the economy as a whole or to members of society as consumers.
- c. Individual companies and the economy as a whole, rather than to industries or to members of society as consumers.
- d. Individual companies, industries, and the economy as a whole, rather than to members of society as consumers.

**M2-3** According to **Statement of Financial Accounting Concepts No. 2**, an interim earnings report is expected to have which of the following?

	Predictive value	Feedback value
a.	No	No
b.	Yes	Yes
c.	Yes	No
d.	No	Yes

**M2-4** A patent, purchased in 2004 and being amortized over a 10-year life, was determined to be worthless in 2007. The write-off of the asset in 2007 is an example of which of the following principles?

- a. Associating cause and effect
- b. Immediate recognition
- c. Systematic and rational allocation
- d. Objectivity

**M2-5** An accrued expense is an expense

- a. Incurred but not paid
- b. Incurred and paid
- c. Paid but not incurred
- d. Not reasonably estimable

**M2-6** Which of the following accounting concepts states that an accounting transaction should be supported by sufficient evidence to allow two or more qualified individuals to arrive at essentially similar measures and conclusions?

- a. Matching
- b. Verifiability
- c. Periodicity
- d. Stable monetary unit

**M2-7** Which of the following is considered a pervasive constraint by **Statement of Financial Accounting Concepts No. 2**?

- a. Benefits/costs
- b. Conservatism
- c. Timeliness
- d. Verifiability

**M2-8** The valuation of a promise to receive cash in the future at present value on the financial statements of a company is valid because of the accounting concept of

- a. Entity
- b. Materiality
- c. Going concern
- d. Neutrality

**M2-9** Under **Statements of Financial Accounting Concepts No. 2**, which of the following relates to both relevance and reliability?

- a. Timeliness
- b. Neutrality
- c. Feedback value
- d. Consistency

**M2-10** Under **Statement of Financial Accounting Concepts No. 6**, which of the following, in the most precise sense, means the process of converting noncash resources and rights into cash or claims to cash?

- a. Allocation
- b. Recordation
- c. Recognition
- d. Realization

## CASES

### COMMUNICATION

#### C2-1 Qualitative Characteristics

In *FASB Statement of Concepts No. 2*, several qualitative characteristics of useful accounting information were identified. The following is a list of these qualities as well as a list of statements describing the qualities.

- A. Comparability
- B. Decision usefulness
- C. Relevance
- D. Reliability

- E. Predictive value
- F. Feedback value
- G. Timeliness
- H. Verifiability

- I. Neutrality
- J. Representational faithfulness
- K. Consistency
- L. Materiality

- \_\_\_\_\_ 1. Ability of measurers to form a consensus that the selected accounting method has been used without error or bias.
- \_\_\_\_\_ 2. Making information available to decision makers before it loses its capacity to influence decisions.
- \_\_\_\_\_ 3. Capacity to make a difference in a decision.
- \_\_\_\_\_ 4. Overall qualitative characteristic.
- \_\_\_\_\_ 5. Absence of bias intended to influence behavior in a particular direction.
- \_\_\_\_\_ 6. Reasonably free from error and bias.
- \_\_\_\_\_ 7. Helps decision makers forecast correctly.
- \_\_\_\_\_ 8. Validity.
- \_\_\_\_\_ 9. Interactive quality; helps explain similarities and differences between two sets of facts.
- \_\_\_\_\_ 10. Quantitative “threshold” constraint.
- \_\_\_\_\_ 11. Conformity from period to period.
- \_\_\_\_\_ 12. Helps decision makers confirm or correct prior expectations.

**Required**

Place the appropriate letter identifying each quality on the line in front of the statement describing the quality.

**C2-2 Accounting Assumptions and Principles**

Certain accounting assumptions and principles have had an important impact on the development of generally accepted accounting principles. The following is a list of these assumptions and principles as well as a list of statements describing certain accounting practices.

- |                    |                  |
|--------------------|------------------|
| A. Entity          | E. Monetary unit |
| B. Continuity      | F. Realization   |
| C. Period of time  | G. Matching      |
| D. Historical cost | H. Conservatism  |
- \_\_\_\_\_ 1. The business, rather than its owners, is the reporting unit.
- \_\_\_\_\_ 2. Depreciation costs are expensed in the periods of use rather than at the time the asset is acquired.
- \_\_\_\_\_ 3. Accounting measurements are reported in dollars.
- \_\_\_\_\_ 4. The year is the normal reporting unit.
- \_\_\_\_\_ 5. In the absence of evidence to the contrary, the business will operate long enough to carry out its existing commitments.
- \_\_\_\_\_ 6. Revenue is usually recognized at the time of sale.
- \_\_\_\_\_ 7. Exchange price is retained in the accounting records.
- \_\_\_\_\_ 8. An accounting alternative is selected that is least likely to overstate assets and income.

**Required**

Select the accounting assumption or principle that justifies each accounting practice and place the appropriate letter on the line preceding the statement.

**C2-3 Objectives of Financial Reporting**

The FASB has identified several objectives of financial reporting. These objectives proceed from the more general to the more specific and are intended to act as guidelines for providing accounting information in financial reports.

**Required**

Starting with the most general objective, prepare a written report that identifies and briefly explains the objectives of financial reporting.

**C2-4 Qualities of Useful Accounting Information**

A friend of yours, who is not an accounting major, is concerned about the “usefulness” of accounting information. The friend states: “I have watched you prepare many financial statements in completing your homework assignments. But how do you determine whether the information in these financial statements is useful? What are the characteristics or qualities of useful accounting information?”

**Required**

Prepare a written response for your friend that identifies and explains the qualitative characteristics of useful accounting information.

**C2-5 Cost and Expense Recognition**

**AICPA Adapted** An accountant must be familiar with the concepts involved in determining earnings of a company. The amount of earnings reported for a company is dependent on the proper recognition, in general, of revenue and expense for a given time period. In some situations costs are recognized as expenses at the time of product sale; in other situations guidelines have been developed for recognizing costs as expenses or losses by other criteria.

**Required**

1. Explain the rationale for recognizing costs as expenses at the time of product sale.
2. What is the rationale underlying the appropriateness of treating costs as expenses of a period instead of assigning the costs to an asset? Explain.
3. Some expenses are assigned to specific accounting periods on the basis of systematic and rational allocation of asset cost. Explain the underlying rationale for recognizing expenses on this basis.

**C2-6 Characteristics of Useful Information**

**CMA Adapted** Financial accounting and reporting provide information that is used in decision making regarding the allocation of resources. In **Statement of Financial Accounting Concepts No. 1**, “Objectives of Financial Reporting by Business Enterprises,” the FASB defined the following basic objectives of financial reporting:

Financial reporting should provide understandable information to present and potential users:

- That is useful in making rational decisions.
- That facilitates assessing the amounts, timing, and uncertainty related to the company’s cash flows.
- About the company’s economic resources, its claims to those resources, and the changes in its resources and obligations occurring from earnings and other operating activities.

The qualitative characteristics of useful accounting information were identified in the FASB's **Statement of Financial Accounting Concepts No. 2**, "Qualitative Characteristics of Accounting Information." These characteristics distinguish better information (more useful) from inferior information (less useful).

#### Required

1. For the primary quality relevance,
  - a. define relevance
  - b. explain the meaning and importance of each of the three ingredients of relevance
2. For the primary quality reliability,
  - a. define reliability
  - b. explain the meaning and importance of each of the three ingredients of reliability
3. Explain the concepts of
  - a. comparability
  - b. consistency
  - c. materiality

### C2-7 Objectives, Users, and Stewardship

**CMA Adapted** The owners of CSC Inc., a privately held company, are considering a public offering of the company's common stock as a means of acquiring additional funds. Prior to making a decision about a public offering, the

owners had a lengthy conversation with John Duncan, CSC's chief financial officer. Duncan informed the owners of the reporting requirements of the Securities and Exchange Commission, including the necessity for audited financial statements. At the request of the owners, Duncan also discussed the objectives of financial reporting, the sophistication of users of financial information, and the stewardship responsibilities of management, all of which are addressed in **Statement of Financial Accounting Concepts No. 1**, "Objectives of Financial Reporting by Business Enterprises."

#### Required

1. Discuss the primary objectives of financial reporting.
2. Describe the level of sophistication that can be expected of the users of financial information.
3. Explain the stewardship responsibilities of management.

### C2-8 Segment Reporting

The FASB requires that a company organized in different "operating segments" disclose the revenues, profits, and assets of each of its major operating segments.

#### Required

Prepare a short memo that briefly explains what types of useful information for investment decision making is provided by requiring these disclosures.

## CREATIVE AND CRITICAL THINKING

### C2-9 Relevance versus Reliability

You are listening to two accounting majors, both of whom are seniors. They are debating the merits of having relevant versus reliable accounting information for external decision making. One student states: "In my decision making, if given a choice between relevant and reliable accounting information, I would prefer to have relevant information." The other student replies: "Nonsense! If you cannot rely on the information, then of what use is it?"

#### Required

Based on your knowledge of the FASB's conceptual framework, define the qualitative characteristics of relevance and reliability. Include definitions of the ingredients of each. Which do you think is more important?

### C2-10 Inconsistent Statements on Accounting Principles

**AICPA Adapted** The following two statements have been taken directly or with some modification from the accounting literature. Each of them is either taken out of context, involves circular reasoning, and/or contains one or more fallacies, half-truths, erroneous comments, conclusions, or inconsistencies (internally or with generally accepted principles or practices).

**Statement 1** Accounting is a service activity. Its function is to provide quantitative financial information that is intended

to be useful in making economic decisions about and for economic entities. Thus the accounting function might be viewed primarily as being a tool or device for providing quantitative financial information to management to facilitate decision making.

**Statement 2** Financial statements that were developed in accordance with generally accepted accounting principles, which apply the conservatism convention, can be free from bias (or can give a presentation that is fair with respect to continuing and prospective stockholders as well as to retiring stockholders).

#### Required

Evaluate each of the preceding numbered statements as follows:

1. List the fallacies, half-truths, circular reasoning, erroneous comments or conclusions, and/or inconsistencies.
2. Explain by what authority and/or on what basis each item listed in (1) can be considered to be fallacious, circular, inconsistent, a half-truth, or an erroneous comment or conclusion. If the statement or a portion of it is merely out of context, indicate the context(s) in which the statement would be correct.

### C2-11 Accounting Entity

**AICPA Adapted** The concept of the accounting entity often is considered to be the most fundamental of accounting concepts, one that pervades all of accounting.

**Required**

- What is an accounting entity? Explain.
  - Explain why the accounting entity concept is so fundamental that it pervades all of accounting.
- For each of the following indicate whether the accounting concept of entity is applicable; discuss and give illustrations.
  - A unit created by or under law
  - The product-line operating segment of an enterprise
  - A combination of legal units and/or product-line operating segments
  - All of the activities of an owner or a group of owners
  - An industry
  - The economy of the United States

**C2-12 Timing of Revenue Recognition**

**AICPA Adapted** Revenue usually is recognized at the point of sale. Under special circumstances, however, bases other than the point of sale are used for the timing of revenue recognition.

**Required**

- Why is the point of sale usually used as the basis for the timing of revenue recognition?
- Disregarding the special circumstances when bases other than the point of sale are used, discuss the merits of each of the following objections to the sales basis of revenue recognition:
  - It is too conservative because revenue is earned throughout the entire process of production.
  - It is not conservative enough because accounts receivable do not represent disposable funds; sales returns and allowances may be made; and collection and bad debt expenses may be incurred in a later period.
- Revenue may also be recognized (a) during production and (b) when cash is received. For each of these two bases of timing revenue recognition, give an example of the circumstances in which it is properly used and discuss the accounting merits of its use in lieu of the sales basis.

**C2-13 Accruals and Deferrals**

**AICPA Adapted** Generally accepted accounting principles require the use of accruals and deferrals in the determination of income.

**Required**

- How does accrual accounting affect the determination of income? Include in your discussion what constitutes an accrual and a deferral, and give appropriate examples of each.
- Contrast accrual accounting with cash accounting.

**C2-14 Revenue Recognition**

The following are brief descriptions of several companies in different lines of business.

- Company A is a construction company. It has recently signed a contract to build a highway over a three-year period. A down payment was collected; the remaining

collections will occur periodically over the construction period based upon the degree of completion.

- Company B is a retailer. It makes sales on a daily basis for cash and on credit cards.
- Company C is a health spa. It has recently signed contracts with numerous individuals to use its facilities over a two-year period. The contract price was collected in advance.
- Company D is a land development company. It has recently begun developing a “retirement community” and has sold lots to senior citizens. The sales contract requires a small down payment and periodic payments until completion of the roads and a clubhouse, after which the remainder of the purchase price is due. Prior to this point, a purchaser may cancel the contract and receive a refund of all payments.

**Required**

Describe when revenue should be recognized by each company. If revenue should not be recognized at the time of sale, indicate what method should be used to recognize the revenue. Justify your decision.

**C2-15 Violations of Assumptions and Principles**

The following are accounting procedures and practices used by several companies.

- As soon as it purchases inventory, Sokolich Company records the purchase price as cost of goods sold to simplify its accounting procedures.
- At the end of each year Sloan Company records and reports its economic resources based on appraisal values.
- Ebert Company prepares financial statements only every two years to reduce its costs of preparing the statements.
- Guthrie Company sells on credit and records revenue at that time, even though it knows that collection is highly uncertain and very significant efforts have to be made to collect the accounts.
- Because of inflation, Cross Company adjusts its financial statements each year to show the current purchasing power for all items.
- David Thomas combines his personal transactions and business transactions when he prepares his company’s financial statements so that he can tell how well he is doing on an “overall” basis.
- At the end of each year Vann Company reports its economic resources on a liquidation basis even though it is likely to operate in the future.

**Required**

Identify what accounting assumption or principle each procedure or practice violates, and indicate what should be done to rectify the violation.

**C2-16 Conceptual Framework**

**CMA Adapted** The Financial Accounting Standards Board has developed a conceptual framework for financial accounting and reporting. The FASB has issued **7 Statements of Financial Accounting Concepts**. These statements set

forth objectives and fundamentals that will be the basis for developing financial accounting and reporting standards. The objectives identify the goals and purposes of financial reporting. The fundamentals are the underlying concepts of financial accounting concepts that guide the selection of transactions, events, and circumstances to be accounted for; their recognition and measurement; and the means of summarizing and communicating them to interested parties.

The purpose of **Statement of Financial Accounting Concepts No. 2**, "Qualitative Characteristics of Accounting Information," is to examine the characteristics that make accounting information useful. The characteristics or qualities of information discussed in *Concepts No. 2* are the ingredients that make information useful and are the qualities to be sought when accounting choices are made.

#### Required

1. Identify and discuss the benefits which can be expected to be derived from the FASB's conceptual framework study.
2. What is the most important quality for accounting information as identified in **Statement of Financial Accounting Concepts No. 2**? Explain why it is the most important.
3. **Statement of Financial Accounting Concepts No. 2** describes a number of key characteristics or qualities for

accounting information. Briefly discuss the importance of understandability, relevance, and reliability for financial reporting purposes.

#### C2-17 Ethics and Income Reporting

You have been hired as an "accounting consultant" by Watson Company to evaluate its financial reporting policies. Watson is a small corporation with a few stockholders owning stock that is not publicly traded. In a discussion with you, Chris Watson, the company president, says "For the Watson Company's annual income statement, it is our policy to always record and report revenues when we collect the cash and to record and report expenses when we pay the cash. I like this approach and I think our stockholders and creditors do too. This policy results in income that is reliable and conservative, which is the way accounting should be. Besides, it is easy to keep track of our income. All I need are the receipts and payments recorded in the company's checkbook."

#### Required

From financial reporting and ethical perspectives, how would you reply to Chris?

## 3

# Review of a Company's Accounting System

## OBJECTIVES

After reading this chapter, you will be able to:

- 1 Understand the components of an accounting system.
- 2 Know the major steps in the accounting cycle.
- 3 Prepare journal entries in the general journal.
- 4 Post to the general ledger and prepare a trial balance.
- 5 Prepare adjusting entries.
- 6 Prepare financial statements.
- 7 Prepare closing entries.
- 8 Complete a worksheet (spreadsheet).
- 9 Prepare reversing entries.
- 10 Use subsidiary ledgers.
- 11 Understand special journals.
- 12 Convert cash-basis financial statements to accrual-basis (Appendix).

## Houston, We Have a Problem!

Maintaining an accounting information system is essential to ensuring that economic transactions and financial information are properly entered into the accounting records and that financial reports are prepared in an accurate and timely fashion. The consequences of a dysfunctional accounting system can lead to widespread organizational problems. For example, at **NASA**, problems with the implementation of an enterprise-wide accounting system were blamed for more than \$565 billion of inadequately documented year-end adjustments. A 2003 Government Accounting Office (GAO) report indicated that the existing accounting system impaired NASA's ability to collect, maintain, and report the full costs of its projects and programs. Further, the GAO noted that NASA's accounting system could not provide adequate cost data for planning purposes nor did it enable effective monitoring of work performed. Instances such as this illustrate the critical need of a well-functioning accounting system as an ingredient to any successful business endeavor.

In addition to organizational problems caused by sloppy bookkeeping, well-known cases such as **Enron**, **WorldCom**, and **HealthSouth** have shown how inadequate controls over accounting systems can result in massive financial frauds. To address these concerns, Section 404 of the **Sarbanes-Oxley Act** requires management to take responsibility for establishing and maintaining adequate internal controls over financial reporting

Credit: © Getty Images/PhotoDisc

as well as providing an assessment of the effectiveness of the internal controls. The existence of effective internal controls over financial reporting, coupled with independent verification of these controls, should reduce the probability of accounting irregularities occurring while improving transparency of the financial reporting process. A 2004 survey by Financial Executives International (FEI) estimates that first-year compliance costs with Section 404 will average \$4.6 million and 35,000 hours of internal manpower for each of the largest U.S. companies. While the costs and benefits of the internal control reporting responsibilities are controversial, one goal of these new regulations is to ensure that each company's accounting system produces relevant and reliable financial reports.

### FOR FURTHER INVESTIGATION

For a discussion of the effects of Sarbanes-Oxley Act on the accounting profession, consult the Business & Company Resource Center (BCRC):

- *Revenge of the Bean Counters: No longer frail in the face of fraud, accounting firms are thriving on new laws that give them real clout.* Daren Fonda, *Time*, 0040-781X, March 29, 2004, v163, i13, p38.

A primary objective of financial reporting is to provide information that is useful to present and potential investors, and to creditors and other users in making rational investment, credit, and similar decisions.<sup>1</sup> A company provides this information in its financial statements and the accompanying notes. These statements are the result of the company's financial accounting process, which we discuss throughout this book. To understand financial accounting, you need to be familiar with the accounting system that a company uses to accumulate the information in its financial statements. This system is the topic of this chapter.

## THE ACCOUNTING SYSTEM

A major purpose of a company's accounting system is to provide useful information to both external users and to the company's managers for making operating decisions. Many transactions result in important financial and managerial accounting information. **An accounting system is the means by which a company records and stores the financial and managerial information from its transactions so that it can retrieve and report the information in an accounting statement.** All companies have accounting systems, ranging from the very simple, such as a checkbook, to the very complex, involving the use of networked computers.

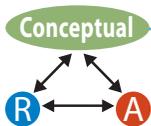

In this chapter we present the basics of a *financial* accounting system that a company can use in either a manual or a computer accounting process. For convenience, our discussion is primarily in terms of a manual system. The components of an accounting system include (1) the framework for operation of the system, (2) the input source documents, (3) the records used to store accounting information, and (4) the output reports. We discuss each of these components in later sections.

1 Understand the components of an accounting system.

### Accounting Equation

The steps in a company's accounting system include:

- identifying the events occurring within its economic environment that are financial transactions,
- gathering the documents related to these transactions,
- analyzing the documents to determine the relevant financial information to be recorded,
- recording the financial information, and
- storing this information for future retrieval and use.

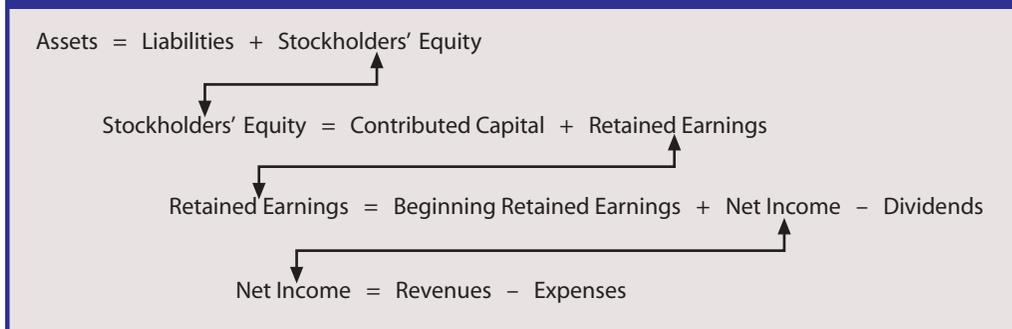

A basic accounting model provides a framework for the accounting system and is the basis for recording transactions. This model for a corporation, called the **residual equity theory** model, is usually expressed in an equation as follows:

$$\text{Assets} = \text{Liabilities} + \text{Stockholders' Equity}$$

where **assets** are the corporation's economic resources, **liabilities** are its obligations owed to creditors, and **stockholders' equity** is the owners' residual interest in its assets. This equation must remain in balance at all times because each side presents a different "picture" of the same information. That is, the left side summarizes the corporation's economic resources while the right side summarizes the sources of (or claims to) the economic resources. Other equations related to information wanted by external users evolve from this basic equation. We show these interrelated equations in Exhibit 3-1.

1. "Objectives of Financial Reporting by Business Enterprises," *FASB Statement of Financial Accounting Concepts No. 1* (Stamford, Conn.: FASB, 1978), par. 34.

**EXHIBIT 3-1 Interrelated Accounting Equations**

**Contributed capital** includes the amounts of stockholder investments resulting from the sale of shares of stock by the corporation, while **retained earnings** is the lifetime amount of net income reinvested in the corporation and not distributed to stockholders.<sup>2</sup> **Dividends** (which are *not* expenses) are the amounts distributed to stockholders as a return on their investment. **Revenues** are charges to customers for goods or services provided and **expenses** are the costs incurred by the corporation to provide the goods or services.<sup>3</sup>

### Transactions, Events, and Supporting Documents

For financial accounting purposes, a change in a company's economic resources (assets), obligations (liabilities), or residual interest (stockholders' equity) may be caused by a transaction or an event. A **transaction** involves the transfer of something valuable between the company and another party. An **event** is a "happening" that affects the company. The event may be *internal*, such as using equipment in operations, or *external*, such as a decline in the value of an asset. The company records the transactions and events affecting its economic resources and obligations in its accounting system. The company uses business documents, or **source documents**, relating to these transactions and events as initial information for the recording process. These documents (such as sales invoices, checks, and freight bills) normally contain information about the monetary amount to be recorded, the parties involved, the terms of the transactions, and other relevant information. After the company records a transaction or event, it stores the supporting source documents to verify its accounting records.

### Accounts

Within the accounting system, a company uses accounts to store the recorded monetary information from its transactions and events. It keeps a separate account for each asset, liability, revenue, expense, and other stockholders' equity item. Examples of these accounts include Cash, Accounts Receivable (amounts due from customers), Buildings, Accounts Payable (amounts owed to suppliers), Mortgage Payable, Sales Revenue, Cost of Goods Sold, Salaries Expense, Capital Stock, Retained Earnings, and Dividends Distributed. The company assigns each account a number in its **chart of accounts**, a numbering system designed to organize its accounts efficiently and to minimize errors in the recording process.

2. A company may also have accumulated other comprehensive income which we discuss in Chapters 4 and 5.
3. In this chapter, for simplicity, we include *gains* (those revenues from other than the sale of goods or services) in revenues and we include *losses* (those costs incurred that provide no revenues) in expenses. Throughout the book, we discuss and classify gains and losses separately from revenues and expenses.

An account can be in several physical forms. It might be a location on a computer disk or a standardized business form in a manual system. A single logical format is used for all accounts. The format for the accounts in a manual system is called a *T-account*. Each T-account has a left (or *debit*) and a right (or *credit*) side for storing monetary information. Since each account accumulates information about both increases and decreases resulting from various transactions or events, there is a “double-entry” rule for recording these changes. **In the double-entry system, for each transaction or event that a company records, the total dollar amount of the debits entered in all the related accounts must be equal to the total dollar amount of the credits.**

The framework of an accounting system includes the accounts in the basic accounting equation as well as the double-entry system. In an accounting system, all accounts on the left side of the equation (assets) are increased by debits (entries on the left side of the accounts) and decreased by credits, while accounts on the right side of the equation (liabilities and stockholders' equity) are increased by credits (entries on the right side of the accounts) and decreased by debits. The left side of Exhibit 3-2 shows this relationship.

**EXHIBIT 3-2 Accounting Equation and Double-Entry System**

Permanent Accounts						Temporary Accounts			
Assets		=	Liabilities		+	Stockholders' Equity			
<b>Asset Accounts</b>			<b>Liability Accounts</b>			<b>Capital Stock Accounts</b>		<b>Revenue Accounts</b>	
(debit)	(credit)		(debit)	(credit)	(debit)	(credit)	(debit)	(credit)	
Increase	Decrease		Decrease	Increase	Decrease	Increase	Decrease	Increase	
+	-		-	+	-	+	-	+	
						<b>Retained Earnings</b>		<b>Expense Accounts</b>	
					(debit)	(credit)	(debit)	(credit)	
					Decrease	Increase	Increase	Decrease	
					-	+	+	-	
							<b>Dividend Accounts</b>		
							(debit)	(credit)	
							Increase	Decrease	
							+	-	

For example, suppose that stockholders invest \$20,000 in a corporation by purchasing 2,000 shares of its no-par stock at \$10 per share. The corporation records this transaction as a debit (increase) of \$20,000 to an asset account, Cash, and as a \$20,000 credit (increase) to a contributed capital account in stockholders' equity, Capital Stock. Note that the accounting equation remains in balance (both sides increase by \$20,000) and that the total debits equal the total credits.

Assets		=	Liabilities		+	Stockholders' Equity	
<b>Cash</b>						<b>Capital Stock</b>	
(debit)						(credit)	
+						+	
20,000						20,000	

Accounts are classified as permanent (or real) accounts and temporary (or nominal) accounts. The **permanent accounts** are the asset, liability, and stockholders' equity accounts whose balances at the *end* of the accounting period are carried forward into the

next accounting period. The accounts on the far right of Exhibit 3-2, namely the revenue, expense, and dividend accounts, are **temporary accounts**. They are “temporarily” used to determine the changes in retained earnings that occur *during* an accounting period, and their account balances are *not* carried forward into the next period. Exhibit 3-2 also shows the rules for recording transactions in temporary accounts. Because an increase in revenues causes an increase in retained earnings, the rules for recording transactions in revenue accounts are the same as those for retained earnings. However, because an increase in temporary accounts such as expenses and dividends causes a decrease in retained earnings, the rules for recording transactions in these accounts are the *opposite* of those for retained earnings.<sup>4</sup> For instance, since the payment of dividends reduces retained earnings, an increase in a Dividend account is recorded as a debit.

Sometimes a company will use a **contra** (or negative) account to show a reduction in a related account. The rules for increasing or decreasing a contra account are also exactly the *opposite* of those for the related account. A contra account may be related to a permanent account or to a temporary account. For instance, a company uses an Accumulated Depreciation account to accumulate the depreciation recorded for Buildings. We illustrate contra accounts in a later section.

**The balance of an account on a particular date is the difference between the total debits and credits recorded in that account.** A company uses these balances in the preparation of its financial statements.

## Financial Statements

A company’s financial statements are summary reports from its accounting system. These statements are based on the interrelated equations presented earlier. As we introduced in Chapter 2, the major financial statements of a company include (1) the income statement, (2) the balance sheet (alternatively called the statement of financial position), and (3) the statement of cash flows.<sup>5</sup> A company prepares its financial statements at the end of each fiscal year, called the **accounting period**. The set of financial statements and accompanying supporting schedules and notes, along with other information distributed to the various external users, is called the company’s **annual report**. A company often prepares financial statements for a shorter time period, such as three months. These are called **interim** (or quarterly) statements.

**The income statement summarizes the results of a company’s income-producing activities for the accounting period.** In the income statement, the company’s net income is determined by subtracting the total expenses from the total revenues. A supporting schedule (statement) is usually prepared to tie the income statement to the balance sheet. **The statement of retained earnings summarizes the amount of a company’s net income retained in the business.** This procedure involves adding the net income for the period to the balance in the retained earnings account at the beginning of the period, and subtracting the dividends distributed to stockholders.

**The balance sheet summarizes the amounts of a company’s assets, liabilities, and stockholders’ equity at the end of the accounting period.** The stockholders’ equity section includes the ending retained earnings balance from the statement of retained earnings. The balance sheet is so named because it is an expansion of the basic accounting equation, which always remains in balance. Because of the “linkage” between the income statement, statement of retained earnings, and balance sheet due to net income and retained earnings, these financial statements are said to be **articulated**. We illustrate these statements later in Examples 3-5, 3-6, and 3-7.

4. Since *gains* are similar to revenues and *losses* are similar to expenses, the rules for increasing these accounts are the same as those for revenues and expenses, respectively.

5. Some companies also have a fourth major financial statement for reporting their “comprehensive income.” We discuss this topic in Chapters 4 and 5.

The third major statement, **the statement of cash flows, summarizes a company's cash receipts and cash payments during the accounting period.** We do not show it here but briefly discuss it in Chapter 4 and more fully in Chapter 22. The statement of cash flows articulates with the balance sheet because it reconciles the beginning cash balance with the ending cash balance. We also discuss other supporting schedules, such as the schedule of changes in stockholders' equity and the schedule of investing and financing activities not involving cash receipts or cash payments, in Chapters 4 and 22.

### SECURE YOUR KNOWLEDGE 3-1

- The framework of the financial accounting system is based on an equality between the corporation's resources (assets) and the claims on those resources (liabilities and stockholders' equity).
- The inputs to this accounting system are source documents that contain information about transactions (internal or external) that affect a corporation's economic resources or obligations.
- The monetary information from transactions is recorded and stored in accounts so that each transaction has a dual effect on the accounting system (debits equal credits).
- The output of a financial accounting system is the financial statements: the income statement, the statement of retained earnings, the balance sheet, and the statement of cash flows.

## THE ACCOUNTING CYCLE

A company completes a series of steps during each accounting period to record, store, and report the accounting information contained in its transactions. These steps are referred to as the **accounting cycle**. The *major* steps include:

1. Record the daily transactions in a journal
2. Post the journal entries to the accounts in the ledger
3. Prepare and post adjusting entries
4. Prepare the financial statements
5. Prepare and post closing entries for the revenue, expense, and dividend accounts

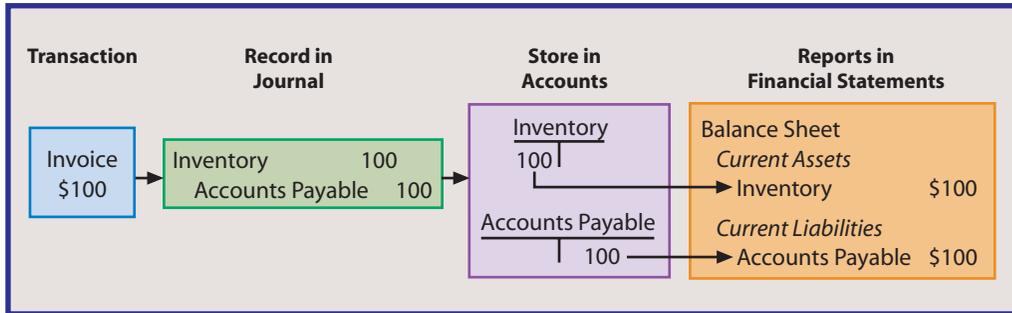

We explain each of the steps in the accounting cycle in the following sections. We explain the steps in terms of a manual accounting system, but most companies use a computer system based on accounting software. This software follows the same procedures as a manual system. We briefly discuss this software at the end of the chapter.

Before we discuss these steps, on the top of the next page we show a diagram so you can see how accounting information from one transaction "flows through" a company's accounting system. For simplicity, the diagram assumes the company purchases inventory of \$100 on credit, but has not yet sold or paid for the inventory by the end of the accounting period. You can see that the accounting cycle starts with the company recording the transaction based on the information in a source document (in this case, an invoice). The information is then stored in the company's accounts until needed. Finally, the cycle ends with reporting the information on one of the company's financial statements (in this case, its balance sheet).

### Recording in the General Journal (Step 1)

A company initially records its transactions (and events) in a journal. A company *could* record all its transactions in a single journal, called the **general journal**. We use a general

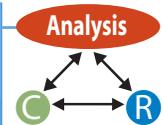

2 Know the major steps in the accounting cycle.

journal in this chapter. However, many companies have a number of different **special journals**, each designed to record a particular type of transaction. We briefly discuss special journals in a later section of this chapter.

The general journal consists of a date column, a column to list the accounts affected by each transaction, a column to list the account numbers (to save space, we do *not* use account numbers in the subsequent comprehensive illustration), a debit column, and a credit column to list the amounts recorded as a debit or credit to each account. Just below each journal entry is a written explanation of the transaction. **The process of recording the transaction in the journal is called journalizing. The resulting entry is referred to as a journal entry.** We show a general journal in Example 3-2 later in this chapter.

There are a number of advantages to using a general journal. First, it helps prevent errors. Because the accounts and debit and credit amounts for each transaction are initially recorded on a single journal page, rather than directly in the numerous accounts, it is easier to verify the equality of the debits and credits. Second, all the transactional information (including the explanation) is recorded in one place, thereby providing a complete “picture” of the transaction. This is especially useful during the auditing process, or if an error is discovered later in the accounting cycle, because the general journal can be reviewed to determine the nature of the transaction. Finally, since the transactions are recorded as they occur, the journal provides a chronological record of the company’s financial transactions.

To show the entire accounting cycle, we present a comprehensive example throughout this section. Dapple Corporation incorporates on January 1, 2007 as a wholesaler. It purchases one product from suppliers and resells this inventory to commercial customers. It opens for business on April 1, 2007. The company uses a perpetual inventory system. Under a **perpetual inventory system**, the inventory account is updated each time the company makes a purchase or sale. When the company purchases inventory, it records the increase (debit) directly in its Inventory account. When it makes a sale, it makes *two* journal entries. The first entry records the sales revenue at the retail price. The second entry records an increase (debit) in the Cost of Goods Sold account (a major expense) and a decrease (credit) in the Inventory account for the cost of the inventory.<sup>6</sup> During 2007, the company engages in several transactions. Example 3-1 lists these transactions and an analysis of the accounts and amounts to be debited and credited. This analysis is based on a review of the related source documents. Some of these transactions are partially condensed and overly simplified so that we may show a variety of transactions.

Based on the transactional analysis listed in Example 3-1, the company prepares the general journal entries shown in Example 3-2. Traditionally, for each entry, the accounts to be debited are listed first. The accounts to be credited are listed next and indented. Finally, a brief explanation of the journal entry is made.

**3** Prepare journal entries in the general journal.

6. Some small companies use a periodic inventory system. We briefly discuss the periodic inventory system later in this chapter. We also discuss both the perpetual and periodic inventory systems more fully in Chapter 8.

**EXAMPLE 3-1 2007 Transactions and Analyses (Dapple Corporation)**

<b>Date</b>	<b>Transaction</b>	<b>Analysis</b>
01/01	Various stockholders invest in Dapple by purchasing 2,000 shares of no-par stock at \$10 per share.	Asset account Cash increased (debited) by \$20,000; stockholders' equity account Capital Stock increased (credited) by \$20,000.
01/16	Dapple purchases 2 acres of land as a building site, paying \$1,500 an acre.	Asset account Land increased (debited) by \$3,000; asset account Cash decreased (credited) by \$3,000.
03/30	A building is built and equipment purchased for \$15,320 and \$2,120, respectively. Dapple pays \$10,840 and signs a 12% note (interest and principal to be paid after 2 years) for the \$6,600 balance.	Asset accounts Building and Equipment increased (debited) by \$15,320 and \$2,120, respectively; asset account Cash decreased (credited) by \$10,840; liability account Notes Payable increased (credited) by \$6,600.
03/30	Dapple purchases a 1-year comprehensive insurance policy for \$360.	Asset account Prepaid Insurance increased (debited) by \$360; asset account Cash decreased (credited) by \$360.
03/31	Dapple purchases \$7,300 of inventory on credit from Bark Company.	Asset account Inventory increased (debited) by \$7,300; liability account Accounts Payable increased (credited) by \$7,300.
04/02	Dapple sells inventory at total cash selling price of \$8,000. The cost of the inventory was \$5,090.	Asset account Cash increased (debited) by \$8,000; revenue account Sales Revenue increased (credited) by \$8,000. Expense account Cost of Goods Sold increased (debited) by \$5,090; Asset account Inventory decreased (credited) by \$5,090.
04/08	Dapple pays \$7,300 to Bark for inventory purchase on 03/31.	Liability account Accounts Payable decreased (debited) by \$7,300; asset account Cash decreased (credited) by \$7,300.
07/15	Dapple makes \$3,300 cash purchase of inventory.	Asset account Inventory increased (debited) by \$3,300; asset account Cash decreased (credited) by \$3,300.
09/01	Dapple sells one acre of land (original cost \$1,500) for \$1,320. It accepts a 6-month, 15% note from buyer.	Asset account Notes Receivable increased (debited) by \$1,320; loss account Loss on Sale of Land increased (debited) by \$180; asset account Land decreased (credited) by \$1,500.
10/01	Dapple pays the first 6 months' salaries (April through September) totaling \$1,800 to employees.	Expense account Salaries Expense increased (debited) by \$1,800; asset account Cash decreased (credited) by \$1,800.
11/23	Dapple makes sales on credit of \$5,000 to Frank Company and \$4,000 to Knox Company. The cost of the inventory was \$5,400.	Asset account Accounts Receivable increased (debited) by \$9,000; revenue account Sales Revenue increased (credited) by \$9,000. Expense account Cost of Goods Sold increased (debited) by \$5,400; Asset account Inventory decreased (credited) by \$5,400.
12/01	Dapple rents part of its building to Fritz Company, receiving 3 months' rent in advance at \$150 per month.	Asset account Cash increased (debited) by \$450; liability account Unearned Rent increased (credited) by \$450.
12/02	Dapple collects \$2,000 of accounts receivable from Frank Company.	Asset account Cash increased (debited) by \$2,000; asset account Accounts Receivable decreased (credited) by \$2,000.
12/27	Dapple purchases \$1,900 of inventory on credit from Ajax Company.	Asset account Inventory increased (debited) by \$1,900; liability account Accounts Payable increased (credited) by \$1,900.
12/28	Dapple pays \$428 of miscellaneous operating expenses.	Expense account Other Expenses increased (debited) by \$428; asset account Cash decreased (credited) by \$428.
12/29	Dapple distributes dividends of \$500 (\$0.25 per share for 2,000 shares) to stockholders.	Dividends Distributed account increased (debited) by \$500; asset account Cash decreased (credited) by \$500.

**EXAMPLE 3-2 General Journal Entries (Dapple Corporation)**

Date	Account Titles and Explanations	Debit	Credit
2007			
Jan. 1	Cash Capital Stock Issued 2,000 shares of no-par stock at \$10 per share.	20,000	20,000
16	Land Cash Purchased 2 acres of land at \$1,500 per acre.	3,000	3,000
Mar. 30	Building Equipment Cash Notes Payable Purchased a building and equipment. The note bears annual interest of 12% and the principal and interest are due on March 30, 2009.	15,320 2,120	10,840 6,600
30	Prepaid Insurance Cash Purchased a 1-year comprehensive insurance policy.	360	360
31	Inventory Accounts Payable Purchased inventory for resale on credit from Bark Company.	7,300	7,300
Apr. 2	Cash Sales Revenue To record cash sales.	8,000	8,000
2	Cost of Goods Sold Inventory To record cost of sales.	5,090	5,090
8	Accounts Payable Cash Paid Bark Company for purchases made on credit on March 31.	7,300	7,300
July 15	Inventory Cash Purchased inventory for resale.	3,300	3,300
Sept. 1	Notes Receivable Loss Land Sold 1 acre of land at less than its cost, incurring a loss. Buyer issued a note due in 6 months and bearing 15% annual interest.	1,320 180	1,500
Oct. 1	Salaries Expense Cash Paid 6 months' of employees' salaries.	1,800	1,800
Nov. 23	Accounts Receivable Sales Revenue Made sales on credit to the Frank Company (\$5,000) and Knox Company (\$4,000).	9,000	9,000
23	Cost of Goods Sold Inventory To record cost of sales.	5,400	5,400

(continued)

**Posting to the Ledger (Step 2)**

A general ledger is the entire group of accounts for a company. It might take several forms, such as a storage location on a computer disk, or in the case of our manual system, a loose-leaf binder with a page for each T-account. After a company journalizes its transactions and events in a general journal, it updates each account in the general ledger. This is done through the process of **posting**. Posting involves transferring the date and debit and credit amounts from the journal entries in the general journal to the debit and credit

**4** Post to the general ledger and prepare a trial balance.

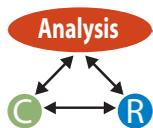

**EXAMPLE 3-2 (Continued)**

Date	Account Titles and Explanations	Debit	Credit
Dec. 1	Cash Unearned Rent Received 3 months' rent in advance at \$150 per month. Company owes use of portion of building to Fritz Company for the 3-month period.	450	450
2	Cash Accounts Receivable Frank Company paid a portion of its accounts receivable.	2000	2000
27	Inventory Accounts Payable Purchased inventory on credit from Ajax Company.	1,900	1,900
28	Other Expenses Cash Paid miscellaneous operating expenses.	428	428
29	Dividends Distributed Cash Distributed dividends of \$0.25 per share to stockholders.	500	500

sides of the accounts in the general ledger. Thus, **after posting, the general ledger accounts contain the same information as in the general journal, just in a different format.** Example 3-3 shows *all* the accounts in the general ledger of the Dapple Corporation. To conserve space, these accounts include the postings not only for the journal entries shown in Example 3-2, but also for the *adjusting* entries (*Adj* is shown in the account) and the *closing* entries (*Cl*) discussed later in Examples 3-4 and 3-9.<sup>7</sup>

### Trial Balance

After a company prepares and posts its journal entries for the accounting period, it determines the balance in each account. Then a trial balance is often prepared. A **trial balance is a working paper that lists all the company's general ledger accounts and their account balances.** These account balances are listed in either the debit or the credit column. The trial balance is used to verify that the total of the debit balances is equal to the total of the credit balances. This working paper is not shown here but is included on the worksheet in Example 3-10.

If a trial balance does not balance, there is an error. To find the error, add the debit and credit columns of the trial balance again. If the column totals do not agree, check the amounts in the debit and credit columns to be sure that a debit or credit account balance was not mistakenly listed in the wrong column. If the error is still not found, compute the difference in the column totals and divide by 9. When the difference is evenly divisible by 9, there is a good chance that a *transposition* or a *slide* has occurred. A transposition occurs when two digits in a number are mistakenly reversed. For instance, if the \$1,500 Land balance is listed as \$5,100 on the trial balance in Example 3-10, the debit column would total \$49,550 instead of \$45,950. The difference, \$3,600, is evenly divisible by 9. A slide occurs when the digits are listed in the correct order but are mistakenly moved one decimal place to the left or right. For instance, in Example 3-10 if the \$1,900 Accounts Payable balance is listed as \$190, the credit column would total \$44,240 instead of \$45,950. The \$1,710 difference is evenly divisible by 9.

7. A company may also use subsidiary ledgers, such as an accounts receivable subsidiary ledger and an accounts payable subsidiary ledger. We discuss subsidiary ledgers later in this chapter.

**EXAMPLE 3-3 General Ledger (Dapple Corporation)**

<b>Cash</b>				<b>Accumulated Depreciation: Building</b>				<b>Interest Revenue</b>	
01/01	20,000	01/16	3,000			12/31 Adj	264	12/31 Cl	66
04/02	8,000	03/30	10,840	<b>Equipment</b>				<b>Rent Revenue</b>	
12/01	450	03/30	360	03/30	2,120			12/31 Cl	150

<b>Building</b>								12/31 Cl	17,000
03/30	15,320							04/02	8,000
								11/23	9,000

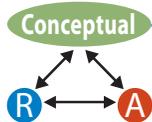

If a transposition or slide has occurred, the error may have occurred when the account balances were transferred from the accounts to the trial balance or when the account balances were computed initially. To find the error, first compare the account balances listed on the trial balance with the account balances listed in the ledger. Then recompute the ledger account balances, and if no error is found, double-check the postings. Finally, review the journal entries for accuracy.

If the trial balance is in balance, it is likely that (1) equal debit entries and credit entries were recorded for each transaction; (2) the debit and credit entries are posted to the accounts; and (3) the account balances are correctly computed. The equality of the debit and credit totals, however, does not necessarily mean that the information in the accounting system is error-free. A trial balance does not pick up several types of errors. First, an entire transaction may not have been journalized. Second, an entire transaction may not

have been posted to the accounts. Third, equal debits and credits, but of the wrong amount, may have been recorded for a transaction. Fourth, a transaction may have been journalized to a wrong account. Finally, a journal entry may have been posted to the wrong account.

### Preparation of Adjusting Entries (Step 3)

#### 5 Prepare adjusting entries.

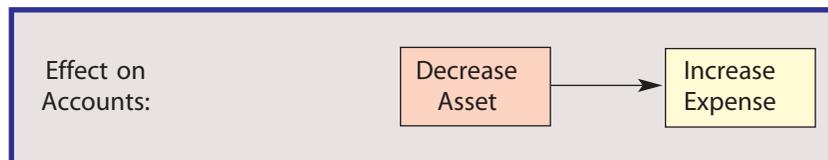

Most companies use generally accepted accounting principles which require the accrual method of accounting. Under *accrual accounting*, a company records revenues in the accounting period in which they are earned and realized (or realizable). The company also records (matches) expenses in the accounting period in which they are incurred, regardless of the inflow or outflow of cash. In many instances, not all accounts are up to date at the end of the accounting period. A company must *adjust* certain amounts so that all its revenues and expenses are recorded and its balance sheet accounts have correct ending balances. **Adjusting entries are journal entries made at the end of the accounting period so that a company's financial statements include the correct amounts for the current period.**

An adjusting entry ordinarily affects both a permanent (balance sheet) and a temporary (income statement) account. Adjusting entries may be classified into three categories. These categories and the types of balance sheet accounts involved in the adjusting entries are:

1. Apportionment of prepaid and deferred items
  - a. Prepaid expenses
  - b. Deferred revenues
2. Recording of accrued items
  - a. Accrued expenses
  - b. Accrued revenues
3. Recording estimated items

### Prepaid Expenses

A prepaid expense (sometimes called a prepaid asset) is a good or service purchased by a company for its operations but not fully used up by the end of the accounting period. When the company initially purchases the good or service, it records the *cost* as an asset (prepaid expense). At the end of the accounting period, the company has used some of these goods or services to generate revenues. The costs are systematically *matched*, as expenses, against the current revenues, while the unused cost remains as an asset on the balance sheet. Examples of prepaid expenses include prepaid rent, office supplies, and prepaid insurance. Below we show the effect of a prepaid expense adjusting entry on a company's accounts. Then we explain Dapple Corporation's related adjusting entry.

In the Dapple Corporation example, it purchased a one-year comprehensive insurance policy on March 30, 2007. It recorded an asset, Prepaid Insurance, for \$360. At the end of the year, nine months of insurance coverage has expired while three months of coverage remains in force. The cost is apportioned as an expense on a straight-line basis (an equal amount each month). Insurance Expense is increased (debited) by \$270 (\$30 per month for nine months) and Prepaid Insurance decreased (credited) by \$270. The result is a \$270 increase in expenses and a \$90 remaining balance in the asset Prepaid Insurance. Example 3-4 shows this adjusting entry which is posted to the ledger accounts shown in Example 3-3. Since the December 31 date of the adjusting entries is the same as

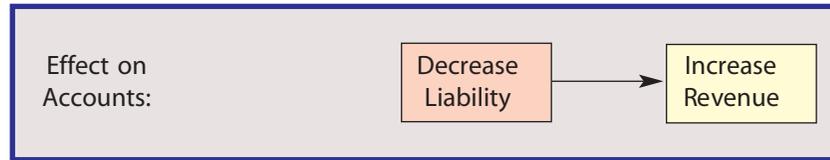

**EXAMPLE 3-4 Adjusting Entries for 2007 (Dapple Corporation)**

Date	Account Titles and Explanations	Debit	Credit
<i>Adjusting Entries</i>			
Dec. 31	Insurance Expense Prepaid Insurance To record expiration of 9 months of insurance coverage purchased on March 30.	270	270
31	Unearned Rent Rent Revenue To record earning of 1 month of rent revenue from receipt collected in advance on December 1.	150	150
31	Salaries Expense Salaries Payable To record 3 months' salaries earned by employees but not yet paid.	900	900
31	Interest Expense Interest Payable To record interest accumulated on the note payable issued on March 30 and due March 30, 2009.	594	594
31	Interest Receivable Interest Revenue To record interest accumulated on the note receivable accepted on September 1.	66	66
31	Depreciation Expense: Building Accumulated Depreciation: Building To record 9 months' depreciation on building acquired March 30.	264	264
31	Depreciation Expense: Equipment Accumulated Depreciation: Equipment To record 9 months' depreciation on equipment acquired March 30.	120	120
31	Bad Debts Expense Allowance for Doubtful Accounts To record estimated uncollectible accounts receivable.	170	170
31	Income Tax Expense Income Taxes Payable To record income taxes for the period.	600	600

the December 31 date for the closing entries (which we discuss in Example 3-9), each adjusting entry date is followed by the abbreviation *Adj* to clarify the postings.

### Deferred Revenues

Deferred (or unearned) revenue is payment received by a company in advance for the future sale of inventory or performance of services. Initially the company usually records a liability because it has an obligation to provide the goods or services. When the company has provided the goods or services to the customer, it eliminates the liability and records the revenue in an adjusting entry. Although the adjusting entry may be made at the time the goods or services are provided, it may also be made at the end of the accounting period. Below we show the effect of a deferred revenue adjusting entry on a company's accounts. Then we explain Dapple Corporation's related adjusting entry.

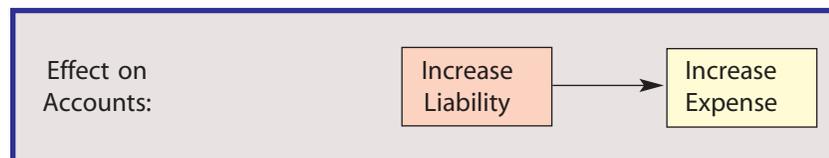

On December 1, Dapple Corporation received \$450 for three months' rent in advance. It recorded the receipt as a liability, Unearned Rent. On December 31 it must make an adjusting entry because it has now earned one month of rent. The adjusting entry is a debit (decrease) of \$150 to Unearned Rent and a credit (increase) of \$150 to Rent Revenue. The result is a \$150 increase in revenues and a \$300 remaining balance in the liability Unearned Rent. Example 3-4 shows this adjusting entry.

A company might *initially* record the entire prepayment of a cost as an expense (instead of as an asset) or the entire receipt in advance as a revenue (instead of a liability). In this case the company must still make adjusting entries at the end of the accounting period, but they are different in form and amount. For example, Dapple Corporation *could* have recorded the March 30 payment as a \$360 debit to Insurance Expense (instead of Prepaid Insurance) and it *could* have recorded the December 1 receipt of \$450 as a credit to Rent Revenue (instead of Unearned Rent). In this case the adjusting entry procedure is to calculate the appropriate ending balances in the permanent accounts and adjust the accounts accordingly. For instance, Prepaid Insurance should have an ending balance of \$90. The year-end adjusting entry must *reduce* the expense and *increase* the Prepaid Insurance account by this amount. The adjusting entry is a debit (increase) to Prepaid Insurance for \$90 and a credit (decrease) to Insurance Expense for \$90. Similarly, Unearned Rent should have an ending balance of \$300. The year-end adjusting entry must *reduce* the revenue and *increase* the Unearned Rent account by this amount. The adjusting entry is a debit (decrease) to Rent Revenue for \$300 and a credit (increase) to Unearned Rent for \$300. The results of these adjusting entries are the *same* balances in the respective accounts as we show in the comprehensive illustration. Be careful to determine how advance payments and receipts were initially recorded before determining the adjusting entry.

### Accrued Expenses

An accrued expense is an expense that a company has incurred during the accounting period but has neither paid nor recorded. To match expenses against revenues and to reflect the proper liabilities at the end of the period, a company must make an adjusting entry for each accrued expense. Below we show the effect of an accrued expense adjusting entry on a company's accounts. Then we explain Dapple Corporation's related adjusting entries.

Dapple Corporation has three accrued expenses it has not yet recorded: employees' salaries, interest, and income taxes.

**Accrued Salaries** For simplicity, assume the company pays employees' salaries every six months, making the last \$1,800 payment on October 1. At the end of December, its employees have earned salaries for three months (October through December) although they have not been paid. The adjusting entry is a debit (increase) to Salaries Expense for \$900 and a credit (increase) to Salaries Payable for \$900. The result is a \$900 increase in expenses and a \$900 ending balance in the liability, Salaries Payable. Example 3-4 shows this adjusting entry.

**Accrued Interest** On March 30, Dapple Corporation issued a \$6,600, 12% note payable due at the end of two years. Although it will not *pay* the principal and interest until 2009,

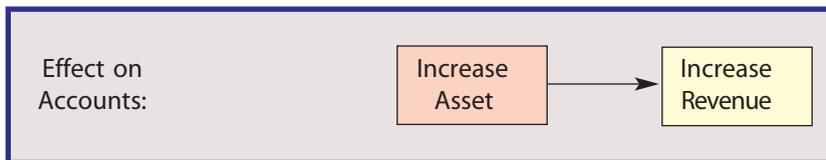

Credit: ©Getty Images/PhotoDisc

nine months of interest expense has accumulated and is a liability at the end of 2007. The interest is computed using the equation:  $\text{Interest} = \text{Principal} \times \text{Rate} \times \text{Time}$ , where time is expressed as a fraction of a year. The adjusting entry involves a debit (increase) to Interest Expense for \$594 ( $\$6,600 \times 0.12 \times 9/12$ ) and a credit (increase) to Interest Payable for \$594, as we show in Example 3-4.

**Accrued Income Taxes** Corporations are subject to a federal (and often state) income tax. Although a corporation may not pay its income taxes until the following period, they are an expense and year-end obligation of the period in which the corporation earned the income. The adjusting entry for income taxes is prepared *after* all the other adjusting entries because the amount is computed by multiplying the income tax rate times the current income before income taxes. Based on its current income before income taxes and on the current tax rate,<sup>8</sup> Dapple Corporation calculates that its 2007 income taxes are \$600, with the entire amount payable in 2008. The adjusting entry is a debit (increase) to Income Tax Expense for \$600 and a credit (increase) to Income Taxes Payable for \$600, and is shown as the last item in Example 3-4.

**Accrued Revenues** An accrued revenue is a revenue that a company has earned during the accounting period but has neither received nor recorded. The company must make an adjusting entry to increase its assets and revenues at the end of the period. Below we show the effect of an accrued revenue adjusting entry on a company's accounts. Then we explain Dapple Corporation's related adjusting entry.

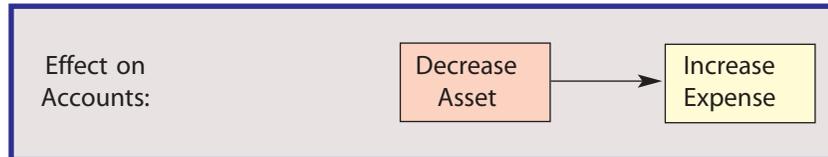

On September 1, Dapple Corporation accepted a \$1,320, 15% note as payment when it sold an acre of land. Although it will not collect the note and interest until 2008, the company has earned four months of interest in 2007. The company records the \$66 of interest ( $\$1,320 \times 0.15 \times 4/12$ ) as a debit (increase) to Interest Receivable and a credit (increase) to Interest Revenue. The result is a \$66 increase in revenues and a \$66 increase in the asset Interest Receivable. Example 3-4 shows this adjusting entry.

8. As we show in Example 3-6, the Dapple Corporation's income before income taxes is \$2,000. Multiplying this amount by an assumed tax rate of 30% yields income taxes of \$600.

### Estimated Items

Certain other adjusting entries are based on estimated amounts because they relate, at least in part, to expected future events. Adjustments involving (1) the depreciation on assets such as buildings and equipment, and (2) the uncollectibility of some accounts receivable are both based upon estimates. Below we show the effect of an estimated item adjusting entry on a company's accounts. Then we explain Dapple Corporation's related adjusting entries.

**Depreciation Expense** When a company acquires an asset such as a machine, sales fixture, or building to use in its operations, the company records the cost as an economic resource (asset). The company expects to use the asset for several periods after which it will dispose of the asset at a value much less than its original cost. The difference between the original cost and an estimate of this later value (alternatively called residual value, salvage value, scrap value, or trade-in value) is the asset's **depreciable cost**. This depreciable cost is allocated as an expense to each accounting period in which the asset is used. This cost allocation process is referred to as **depreciation**. One depreciation method is straight-line depreciation, which allocates a proportionate amount as an expense to each accounting period. Its computation is as follows:

$$\text{Annual Depreciation Expense} = \frac{\text{Cost} - \text{Estimated Residual Value}}{\text{Estimated Service Life}}$$

The company records depreciation at the end of the accounting period in an adjusting entry. The entry increases Depreciation Expense and decreases the remaining depreciable cost of the asset. However, the company does *not* record this decrease directly in the asset account. Instead it *increases* a contra (negative) asset account entitled Accumulated Depreciation. This contra account is subtracted from the asset account on the company's balance sheet. The resulting balance is referred to as the *book value* (or carrying value) of the asset.

Dapple Corporation has two depreciable assets, the building and equipment acquired on March 30, 2007. The company estimates that these assets will have lives of 35 years and 12 years, respectively. The company estimates that the residual value of the building will be \$3,000 and the residual value of the equipment will be \$200 at the end of these lives. Since it used the building and equipment for only nine months during 2007, the depreciation expense is \$264  $\{[(\$15,320 - \$3,000) \div 35] \times 9/12\}$  on the building and \$120  $\{[(\$2,120 - \$200) \div 12] \times 9/12\}$  on the equipment. The adjusting entry for the building is a debit (increase) to Depreciation Expense: Building for \$264 and a credit (increase) to the contra-asset Accumulated Depreciation: Building for \$264. The adjusting entry for the equipment is a debit to Depreciation Expense: Equipment for \$120 and a credit to the contra-asset Accumulated Depreciation: Equipment for \$120. The result is an increase in expenses and a *decrease* in the book value that the company reports on its balance sheet for the building and the equipment. Example 3-4 shows these adjusting entries.

**Bad Debt Expense** Many companies make a large amount of their sales on credit. Regardless of a company's collection efforts, it is likely to have a certain amount of bad debts—customer accounts that will not be collected. Although a company may not know which specific customers will not pay their accounts until a later accounting period, it must match bad debt expense against revenues in the *period of the sale*. Furthermore, the company must reduce its assets so that at the end of the period its accounting records show the amount of accounts receivable that it expects to collect. The adjusting entry to record the increase in expenses and the decrease in assets requires an estimate of future uncollectible accounts. However, since the company does not know in the period of sale

which specific customers will default on their accounts, it does not directly reduce Accounts Receivable. Instead it *increases* a contra-asset account, Allowance for Doubtful Accounts. This account is deducted from Accounts Receivable on the company's balance sheet to report the estimated collectible amount.

For example, assume for simplicity that Dapple Corporation estimates its bad debts to be 1% of total sales. Since the balance in the Sales Revenue account totals \$17,000, the adjusting entry is a debit (increase) to Bad Debts Expense for \$170 and a credit (increase) to the contra-asset Allowance for Doubtful Accounts for \$170. The result is an increase in expenses and a *decrease* in the collectible accounts receivable shown on the company's balance sheet. Example 3-4 shows this adjusting entry.

**Summary** We show the basic framework for adjusting entries in Exhibit 3-3. This framework will be helpful to you in visualizing the appropriate debit and credit entry for each type of adjusting entry. However, you must be careful to identify the proper accounts to use in each adjusting entry. Note that for an estimated item, under the Accounts Credited column, we show the use of a contra-account because typically a company credits (increases) such an account (e.g., accumulated depreciation) to decrease the book value of the related asset.

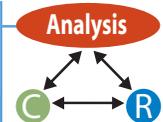

EXHIBIT 3-3 Framework for Adjusting Entries		
Type of Adjusting Entry	Accounts Debited	Accounts Credited
Prepaid Expense:	Debit (increase) Expense	Credit (decrease) Asset
Deferred Revenue:	Debit (decrease) Liability	Credit (increase) Revenue
Accrued Expense:	Debit (increase) Expense	Credit (increase) Liability
Accrued Revenue:	Debit (increase) Asset	Credit (increase) Revenue
Estimated Item:	Debit (increase) Expense	Credit (decrease) Asset [credit (increase) contra account]

## LINK TO ETHICAL DILEMMA

As a newly hired accountant at a Fortune 500 company, you were excited when the controller showed confidence in your abilities by delegating to you the responsibility to make many of the routine adjusting entries related to the preparation of the year-end financial statements. The controller was pleased with the diligence with which you completed the task and assured you that he would not hesitate to increase your responsibilities in the financial reporting department. You were on the fast-track to a promotion. However, three months later, as you were preparing the adjusting entries for the next fiscal quarter, you realized that you had overlooked several adjustments that you should have recorded at year-end. While the overlooked adjustments would most likely not be considered material to last year's financial statements, you are certain that your boss would lose confidence in your abilities. Realizing that you can easily fix the mistake by incorporating the overlooked adjustments into the first quarter adjusting entries for this year, what course of action should you take?

### Preparation of the Financial Statements (Step 4)

After a company prepares and posts the adjusting entries to the general ledger accounts, it prepares its financial statements. This procedure involves several steps. First, the balance

**EXAMPLE 3-5 Adjusted Trial Balance (Dapple Corporation)****Adjusted Trial Balance  
December 31, 2007**

	Debit	Credit
Cash	\$ 2,922	
Accounts receivable	7,000	
Allowance for doubtful accounts		\$ 170
Notes receivable	1,320	
Interest receivable	66	
Inventory	2,010	
Prepaid insurance	90	
Land	1,500	
Building	15,320	
Accumulated depreciation: building		264
Equipment	2,120	
Accumulated depreciation: equipment		120
Accounts payable		1,900
Notes payable		6,600
Salaries payable		900
Interest payable		594
Income taxes payable		600
Unearned rent		300
Capital stock		20,000
Retained earnings		0
Dividends distributed	500	
Sales revenue		17,000
Interest revenue		66
Rent revenue		150
Cost of goods sold	10,490	
Salaries expense	2,700

Loss on sale of land	180	
Depreciation expense: building	264	
Depreciation expense: equipment	120	
Bad debts expense	170	
Insurance expense	270	
Interest expense	594	
Income tax expense	600	
Totals	<u>\$48,664</u>	<u>\$48,664</u>

of each account in the ledger is recomputed if necessary. Next, an adjusted trial balance is frequently prepared; it is similar to a trial balance. **An adjusted trial balance lists all the accounts and the account balances of a company after adjustments (but before closing) in either a debit or a credit column.** The adjusted trial balance is used to verify that the total of the debit balances is equal to the total of the credit balances. This working paper also helps in the preparation of the company's financial statements because all the accounts and amounts included in the financial statements are listed on the adjusted trial balance. Example 3-5 shows the Dapple Corporation's adjusted trial balance. Finally, the company prepares its income statement, statement of retained earnings, and balance sheet in sequential order directly from the information in the adjusted trial balance.

**Income Statement**

Example 3-6 shows Dapple Corporation's income statement for 2007. Sales revenue is listed first. Because the cost of goods sold is directly related to sales, it is shown next. Cost of Goods Sold is deducted to determine the Gross Profit. Operating Expenses (often classified into two groups, Selling Expenses and Administrative Expenses) are deducted next

to determine the Income from Operations. The total of the Other Items section (for recurring items that are not directly related to ongoing operations) is deducted to determine the Income Before Income Taxes. Finally the Income Tax Expense is deducted to determine the Net Income of \$1,400. The \$0.70 Earnings Per Share is computed by dividing the \$1,400 net income by the 2,000 shares owned by the stockholders.

**Retained Earnings Statement**

Example 3-7 shows the retained earnings statement of the Dapple Corporation for 2007. Because 2007 is its first year of operations, the company did not have a beginning retained earnings balance. It did, however, earn net income of \$1,400 and distributed dividends of \$500, resulting in ending retained earnings (the excess of total earnings over total dividends) of \$900.

**EXAMPLE 3-6 Income Statement**

**DAPPLE CORPORATION**

**Income Statement**  
**For Year Ended December 31, 2007**

Sales revenue		\$17,000
Cost of goods sold		<u>(10,490)</u>
Gross profit		\$ 6,510
Operating expenses		
Salaries expense	\$ 2,700	
Other expenses	428	
Depreciation expense: building	264	
Depreciation expense: equipment	120	
Bad debts expense	170	
Insurance expense	<u>270</u>	
Total operating expenses		<u>(3,952)</u>
Income from operations		\$ 2,558
Other items		
Loss on sale of land	\$ (180)	
Interest revenue	66	
Rent revenue	150	
Interest expense	<u>(594)</u>	<u>(558)</u>
Income before income taxes		\$ 2,000
Income tax expense		<u>(600)</u>
Net Income		<u>\$ 1,400</u>
Earnings per share (2,000 shares)		<u>\$ 0.70</u>

**EXAMPLE 3-7 Retained Earnings Statement**

**DAPPLE CORPORATION**

**Statement of Retained Earnings**  
**For Year Ended December 31, 2007**

Retained earnings, January 1, 2007	\$ 0
Add: Net income for 2007	<u>1,400</u>
	\$1,400
Less: Dividends for 2007	<u>(500)</u>
Retained earnings, December 31, 2007	<u>\$ 900</u>

**Balance Sheet**

Example 3-8 shows the Dapple Corporation's balance sheet at the end of 2007. It includes three sections: assets, liabilities, and stockholders' equity. The assets are divided into current assets and property and equipment. The *current assets* are cash and those assets that are expected to be converted into cash or consumed within one year or the operating cycle, whichever is longer. Current assets generally include cash, receivables, temporary investments in marketable securities, inventories, and prepaid items such as insurance and office supplies. *Property and equipment* contains the longer-lived operational assets of the company. This section includes both nondepreciable assets and depreciable assets listed at their book values. The liabilities are divided into current liabilities and long-term liabilities. *Current liabilities* are those obligations that will become due within one year or the operating cycle, whichever is longer, and are expected to be paid with current assets or the creation of other current liabilities. *Long-term liabilities* are obligations that do not meet the current liability criteria. Stockholders' equity includes contributed capital (capital stock) and retained earnings. Total assets amount to \$31,794, and equal the total of liabilities plus stockholders' equity.

**EXAMPLE 3-8 Balance Sheet**

**DAPPLE CORPORATION**

**Balance Sheet  
December 31, 2007**

<b>Assets</b>		<b>Liabilities</b>	
<b>Current Assets</b>		<b>Current Liabilities</b>	
Cash	\$ 2,922	Accounts payable	\$ 1,900
Accounts receivable	\$ 7,000	Salaries payable	900
Less: Allowance for doubtful accounts	(170)	Income taxes payable	600
	6,830	Unearned rent	300
Notes receivable		<b>Total current liabilities</b>	<b>\$ 3,700</b>
(due March 1, 2008)	1,320	<b>Long-Term Liabilities</b>	
Interest receivable	66	Notes payable (due March 30, 2009)	\$ 6,600
Inventory	2,010	Interest payable (due March 20, 2009)	594
Prepaid insurance	90	<b>Total long-term liabilities</b>	<b>\$ 7,194</b>
<b>Total current assets</b>	<b>\$13,238</b>	<b>Total Liabilities</b>	<b>\$10,894</b>
<b>Property and equipment</b>		<b>Stockholders' Equity</b>	
Land	\$ 1,500	Contributed Capital

Less: Accumulated depreciation	(120)	<b>Total Liabilities and Stockholders' Equity</b>	<b>\$31,794</b>
	2,000		
<b>Total property and equipment</b>	<b>\$18,556</b>		
<b>Total Assets</b>	<b>\$31,794</b>		

**Preparation of Closing Entries (Step 5)**

The next step in the accounting process involves preparing and posting closing entries. Closing entries are journal entries that a company makes at the end of the accounting period (1) to reduce the balance in each temporary account to zero, and (2) to update the retained earnings account.

A company uses the temporary accounts (namely, all the revenue, expense, and dividend accounts) during each accounting period to accumulate and summarize information for its

**7** Prepare closing entries.

net income and dividends *for that period*. After the period is over and the company's financial statements are prepared, the balances in these accounts are no longer needed. Furthermore, these accounts must begin the *next* accounting period with a zero balance to summarize the company's net income and dividend information for the next period. Also, the company's permanent stockholders' equity account, Retained Earnings, must be updated for the net income and dividend information contained in the temporary accounts.

The revenue and expense accounts are closed to a temporary closing account called Income Summary. The resulting balance in this account is the company's net income (or loss) for the period. This balance is then transferred to Retained Earnings.

The closing process is straightforward. Each temporary income statement account is debited or credited for the amount that will result in a zero balance in that account. The total of the credits to these accounts is recorded as a debit to the Income Summary account, and the total of the debits is recorded as a credit to Income Summary. A resulting *credit* balance in the Income Summary account is the net income for the period, and is the same amount as that shown on the company's income statement. This credit balance is closed to zero with a debit entry to Income Summary and a credit entry to Retained Earnings for the amount of the net income. If, on the other hand, there is a *debit* balance in the Income Summary account, this means there is a net loss for the period. This debit balance is closed to zero with a debit entry to Retained Earnings and a credit entry to Income Summary for the amount of the net loss. Finally, the Dividends Distributed account is credited for the amount necessary to reduce its balance to zero; the corresponding debit to Retained Earnings reduces it for the amount of the dividends.

Example 3-9 shows the closing entries for the Dapple Corporation which are posted to the ledger accounts shown in Example 3-3. The abbreviation *Cl* is used to identify each December 31 closing entry. The temporary income statement accounts that have a credit balance are closed first. These include all the revenue accounts. The total credit to Income Summary is \$17,216.

The temporary income statement accounts that have a debit balance are closed next. These include all the expense accounts. The total debit to Income Summary is \$15,816.

**EXAMPLE 3-9 Closing Entries for 2007 (Dapple Corporation)**

Date	Account Titles and Explanations	Debit	Credit
<b>Closing Entries</b>			
Dec. 31	Sales Revenue	17,000	
	Interest Revenue	66	
	Rent Revenue	150	
	Income Summary		17,216
	To close the temporary accounts with credit balances.		
31	Income Summary	15,816	
	Cost of Goods Sold		10,490
	Salaries Expense		2,700
	Other Expenses		428
	Loss on Sale of Land		180
	Depreciation Expense: Building		264
	Depreciation Expense: Equipment		120
	Bad Debts Expense		170
	Insurance Expense		270
	Interest Expense		594
	Income Tax Expense		600
	To close the temporary accounts with debit balances.		
31	Income Summary	1,400	
	Retained Earnings		1,400
	To close the income summary balance (net income) to retained earnings.		
31	Retained Earnings	500	
	Dividends Distributed		500
	To close the dividends to retained earnings.		

The Income Summary account now has a credit balance of \$1,400 (\$17,216 credit less the \$15,816 debit). This amount is the net income we computed on the income statement (Example 3-6). It is transferred to Retained Earnings by a debit to Income Summary for \$1,400 (which creates a zero balance in this account) and a credit to Retained Earnings for \$1,400 (which increases this account for the amount of the net income). Finally, the debit balance in the Dividends Distributed account is reduced to zero by a debit to Retained Earnings for \$500 and a credit to Dividends Distributed for \$500.

The result of the closing entries is that (1) all of the company's revenue, expense, and dividend accounts are closed (have zero balances) and are ready to accumulate the net income and dividend information for the next accounting period, (2) the ending balance in its Retained Earnings account is increased by \$900 because of the excess of net income over dividends, and (3) only the permanent balance sheet accounts are open (have nonzero account balances).

After the closing entries are prepared and posted, many companies will prepare a post-closing trial balance. A **post-closing trial balance is prepared to verify that the total of the debit balances is equal to the total of the credit balances in all of the company's permanent accounts.** We do not show this working paper here. The accounting cycle is now complete and a new cycle for the next accounting period begins.

### SECURE YOUR KNOWLEDGE 3-2

- An accounting cycle is composed of five key steps:
  - Recording in a journal
  - Posting to the ledger
  - Preparing and posting adjusting entries
  - Preparing financial statements
  - Preparing and posting closing entries
- Adjusting entries apply accrual accounting concepts to ensure that all revenues earned and all expenses incurred during a period are recorded, regardless of the inflow or outflow of cash.
- Deferred revenues and prepaid expenses result when the cash inflow or outflow occurs prior to the recognition of the revenue or the expense.
- Accrued revenues and expenses result when the recognition of the revenue or expense occurs prior to the cash inflow or outflow.
- Closing entries are required at the end of the accounting cycle to reduce the temporary accounts to zero and to update the retained earnings account for changes that have occurred during the period.

### Additional Issues

For simplicity, we ignored several common items in the Dapple Corporation example. In this section we briefly discuss returns, allowances, and discounts, as well as the periodic inventory system.

#### Returns, Allowances, and Discounts

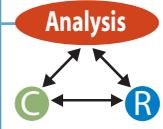

Most companies have sales returns and allowances, as well as purchases returns and allowances. Some also have sales discounts and purchases discounts. How a company records them depends on its accounting system.

When a customer returns merchandise and receives a refund, this is called a **sales return**. When a customer agrees to keep damaged merchandise and the company refunds a portion of the selling price, this is called a **sales allowance**. In either case, these are a reduction in the company's sales revenue. To record these transactions, some companies will create an account, Sales Returns and Allowances, which is a contra-account to the Sales Revenue account. Others will record these transactions directly as a reduction in the

Sales Revenue account. For instance, suppose that Dapple Corporation had previously made a \$500 credit sale to a customer, but the customer returned the item because it was defective. We show both ways of recording this return below<sup>9</sup>:

<i>Using Contra-Account</i>		<i>Reducing Sales Revenue account</i>	
Sales Returns & Allowances	500	Sales	500
Accounts Receivable	500	Accounts Receivable	500

Note that by using a contra-account, Dapple can determine its total sales returns and allowances simply by looking at the account balance. However, this approach requires an additional account in the company’s accounting system. If Dapple records the return directly as a reduction in the sales revenue account, it has one less account in its accounting system. However, it will have to examine the details of the sales revenue account to determine its sales returns and allowances. In a computerized accounting system it is not difficult, however, to design a program to do this.

Some companies offer a discount on credit sales for prompt payment within a discount period. If a customer pays within the discount period, the company receives an amount that is less than the original selling price. This difference is called a **sales (or cash) discount**. A sales discount is also a reduction in the company’s sales revenue. We show how to record sales discounts in Chapter 7.

When a company has sales returns and allowances (and sales discounts), the company must report its net sales on its income statement. **Net sales** are a company’s sales less its sales returns and allowances and sales discounts. For instance, we will slightly modify the amounts in the Dapple Corporation example. Still assume that Dapple Corporation had sales revenue of \$17,000, but that it had sales returns and allowances of \$250 and sales discounts of \$40. In this case, its net sales would be \$16,710 (\$17,000 – \$250 – \$40) and it would report this amount on its 2007 income statement as follows:

Sales (net of \$250 returns and \$40 discounts)            \$16,710

A company usually also has purchases returns and allowances. When the company returns inventory to its supplier, this is called a **purchases return**. When the company agrees to keep damaged inventory and receives a refund from its supplier, this is called a **purchases allowance**. In either case, these are a reduction in the cost of the company’s inventory. To record these transactions, some companies will create an account, Purchases Returns and Allowances, which is a contra-account to the Inventory account. Other companies will record these transactions directly as a reduction in the Inventory account. For instance, suppose that Dapple returned \$300 of inventory that it had purchased on credit from its supplier. We show both ways of recording the return as follows:

<i>Using Contra-Account</i>		<i>Reducing Inventory Account</i>	
Accounts Payable	300	Accounts Payable	300
Purchases Returns & Allowances	300	Inventory	300

Some suppliers offer a discount on credit sales for prompt payment within the discount period. To the purchasing company, this is a **purchases discount**. A purchases discount is also a reduction in the company’s inventory. We show how to record purchases discounts in Chapter 8.

### Periodic Inventory System

As we noted earlier in the chapter, some small companies use a periodic inventory system. Under a **periodic inventory system**, a company records its purchases of inventory using a Purchases account, so that the Inventory account balance does not change during the

9. Since the inventory was returned by the customer, Dapple Corporation would also “reverse” its original Cost of Goods Sold entry by debiting Inventory and crediting Cost of Goods Sold for the cost of the returned inventory.

accounting period. Also, at the time of sale, the company does not make a second journal entry to record the increase in cost of goods sold and decrease in inventory. Instead, it takes a physical inventory at the end of the accounting period. The company then *derives* its cost of goods sold by first computing its cost of goods available for sale. The cost of goods available for sale is the beginning inventory plus the net purchases (purchases less returns and allowances and any purchases discounts). The company then deducts its ending inventory from the cost of goods available for sale to determine its cost of goods sold.

For instance, assume that Dapple Corporation uses a periodic inventory system instead of a perpetual inventory system, and that it also had purchases returns and allowances as well as purchases discounts. Using slightly different numbers than we did in the original example, assume that Dapple made purchases of \$12,600, had purchases returns and allowances of \$300, and had taken purchases discounts of \$100. Also assume that Dapple takes a physical inventory at the end of 2007 to determine that its ending inventory is \$2,140. On Dapple Corporation's income statement for 2007, it would show cost of goods sold of \$10,060, computed as follows:

Inventory, 1/1/2007	\$ 0
Purchases	12,600
Purchases returns and allowances	(300)
Purchases discounts	(100)
Cost of goods available for sale	<u>\$12,200</u>
Less: Inventory, 12/31/2007	<u>(2,140)</u>
Cost of goods sold	\$10,060

Even though a company uses a perpetual inventory system, in certain situations it may use a periodic inventory approach like we show above to estimate its inventory, as we discuss in Chapter 9.

We used a relatively simple accounting system to show a company's accounting cycle. Certain additional complexities are common in companies today. These include a worksheet (spreadsheet), reversing entries, subsidiary ledgers, special journals, and computer software. We discuss each of these topics in the sections that follow.

## WORKSHEET (SPREADSHEET)

### 8 Complete a worksheet (spreadsheet).

At the end of an accounting period, a company prepares adjusting entries, closing entries, and its financial statements. A company often first prepares a worksheet to minimize errors, simplify recording of adjusting and closing entries in the general journal, and make it easier to prepare the financial statements. A worksheet is *not* a substitute for any accounting records or financial statements; it is merely a working paper designed for these purposes.

A worksheet may be a large sheet of multicolumn accounting paper. A common way of preparing an electronic worksheet is to use a software package such as Microsoft Excel®. Example 3-10 shows a worksheet for the Dapple Corporation. This worksheet is based on the same information as we presented earlier in the chapter. It has a column for listing all the ledger accounts, plus debit and credit columns for the trial balance, adjustments, adjusted trial balance, income statement, retained earnings statement, and balance sheet. There are five steps in completing a worksheet.

**Step 1:** The process of completing the worksheet begins with preparing the trial balance. All of the company's accounts and account balances (prior to adjustments) are listed and the debit and credit columns of the trial balance are totaled to verify the equality of the debits and credits. Note that since this is the first year of operations for the Dapple Corporation, the Inventory, Accumulated Depreciation: Building, Accumulated Depreciation: Equipment, and Retained Earnings accounts do not have balances (prior to adjustments). Normally these accounts *do* have balances so we include them in the illustrated trial balance.

**EXAMPLE 3-10 Worksheet (Dapple Corporation)**

	A	B	C	D	E	F	G	H	I	J	K	L	M

49								1,400	1,400			32,348	32,348
50													
51	(a) To record 9 months of insurance expense												
52	(b) To record 1 month of rent revenue												
53	(c) To record 3 months of accrued salaries expense												
54	(d) To record 9 months of accrued interest expense												
55	(e) To record 9 months of accrued interest revenue												
56	(f) To record 9 months depr expense on building												
57	(g) To record 9 months depr expense on equipment												
58	(h) To record estimated bad debts expense												
59	(i) To record income tax expense												

**Step 2:** The accounts are analyzed to determine the necessary adjustments, which are initially entered in the adjustments columns on the worksheet. If an adjustment involves an account that does not currently have a balance, the account title is entered on the first available line below the other account titles. Each of the adjusting journal entries we show in Example 3-4 is initially prepared as shown on the worksheet. Note that the adjusting entry for income taxes is not made until after the income before income taxes is computed. Note also that the accounts in each adjusting entry are *keyed* with the same letter of the alphabet to reduce the likelihood of error. Explanations keyed to these entries are entered at the bottom of the worksheet. They are similar to the adjusting entry explanations that we included in Example 3-4. The adjustments columns are subtotaled to prove the equality of the debits and credits. At this point, some companies prepare an adjusted trial balance in a next set of columns. For an adjusted trial balance, the adjustment amounts are combined with the trial balance amounts to determine the new account balances. This step may be omitted as we did in the Dapple Corporation worksheet. If we had included adjusted trial balance columns, they would look like Example 3-5.

**Step 3:** The trial balance amount of each account is combined with the adjustments to that account and carried over to the proper column of the financial statement in which the account is located. For instance, the \$360 debit balance in Prepaid Insurance is combined with the \$270 credit adjustment, and the new balance of \$90 is carried over to the debit column of the balance sheet.

**Step 4:** The income statement debit and credit columns are subtotaled. Ordinarily the debit column total differs from the credit column total, the difference being the income (or loss) before income taxes. For the Dapple Corporation the \$17,216 credit total exceeds the \$15,216 debit total, indicating income before income taxes of \$2,000. At this point, the applicable tax rate (30% in this case) is multiplied by the income before income taxes to determine the income taxes (\$600). The adjusting entry for income taxes is recorded, and the amounts are carried to the proper columns of the financial statements.

**Step 5:** The financial statement debit and credit columns are totaled in sequential order. First the income statement columns are totaled. The difference between the debit and credit totals is the net income or loss for the period. For the Dapple Corporation the net income is \$1,400. This amount is used to balance the income statement columns. It is also entered in the retained earnings statement credit column. We use the arrows in Example 3-10 for illustrative purposes; they ordinarily are not included on the worksheet. The beginning retained earnings balance (\$0 in this case) is combined with the net income to determine the \$1,400 credit total. The \$500 debit total is the dividends distributed. The \$900 difference is the ending retained earnings. It is used to balance the retained earnings statement columns and is also transferred to the balance sheet credit column. Finally, the balance sheet debit and credit columns are totaled. The \$32,348 total of the debit and credit columns indicates that the system is in balance and the worksheet is complete.

The worksheet is prepared as a preliminary step, before recording the adjusting and closing entries in the general journal and preparing the financial statements. A brief review of the Dapple Corporation worksheet indicates how a worksheet helps in the accounting process. All the adjusting entries are developed and shown on the worksheet in their basic format. They now must be recorded in the general journal. The closing entries are also simplified. The \$17,216 total of the income statement credit column is credited to Income Summary, while the individual accounts with credit balances are debited. Similarly, the \$15,816 debit subtotal is debited to Income Summary, while the individual accounts with debit balances are credited. The remaining closing entries involve closing both net income and dividends to Retained Earnings. Finally, the worksheet helps in preparing the actual financial statements. The amounts from the worksheet columns for each financial statement are rearranged in the proper order on that financial statement. For instance, note how easy it would be to prepare the income statement, retained earnings statement, and balance sheet shown in Examples 3-6, 3-7, and 3-8 from the respective worksheet columns. The worksheet is very useful in preparing *interim* (such as quarterly) financial statements when a company does not actually adjust or close its accounts. The adjusting entries needed to update the financial statements may be made on the worksheet only, thereby enabling the company to keep its accounts on an annual basis.

## REVERSING ENTRIES

### 9 Prepare reversing entries.

After a company adjusts and closes its accounts for the current period, it begins a new accounting cycle for the next accounting period. Prior to journalizing the daily transactions of the new accounting period in the general journal, most companies prepare reversing entries. **A reversing entry is the exact reverse (accounts and amounts) of an adjusting entry.** A company usually makes reversing entries at the same time as closing entries but dates them the first day of the *next* accounting period. A reversing entry is

*optional* and has one purpose: to simplify the recording of a later transaction related to the adjusting entry. A reversing entry enables a company to routinely record the later transaction, without having to consider the possible impact of the prior adjusting entry.

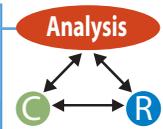

As a general guideline, reversing entries *should* be made for any adjusting entry that creates a new balance sheet account as follows:

1. Adjusting entries that create accrued revenues or expenses to be collected or paid in the next accounting period
2. Adjusting entries related to prepayments of costs initially recorded as expenses or receipts-in-advance initially recorded as revenues

Reversing entries *should not* be made for:

1. Adjusting entries related to prepayments of costs initially recorded as assets or receipts-in-advance initially recorded as liabilities
2. Adjusting entries related to estimated items such as depreciation or bad debts

These guidelines are just that, *guidelines*. They are no substitute for good accounting judgment.

### Example: Reversing Entry

The Dapple Corporation should consider reversing two of the adjusting entries recorded in Example 3-4. That is, the entries to record accrued interest revenue and accrued salaries expense. Each of these is related to a transaction that will occur in the *next* accounting period. The entry to record income taxes is generally not reversed because complex tax laws require careful analysis for each journal entry. Although the adjusting entry for interest expense created an accrued expense, Interest Payable, this entry is not reversed because the subsequent transaction will not occur until 2009. Example 3-11 illustrates reversing entries and how they simplify the recording of subsequent transactions for Interest Revenue and Salaries Expense.

For each of these accounts, in the left column we first assume a reversing entry is *not* made so you can see the complex subsequent journal entry and analysis that is needed. In the right column we assume a reversing entry is made so you can see the much simpler subsequent journal entry and analysis.

Whether or not it makes reversing entries, the Dapple Corporation will collect \$1,419 on March 1, 2008 for the 15%, six-month note receivable accepted on September 1, 2007. The \$1,419 includes the \$1,320 note and \$99 of interest ( $\$1,320 \times 0.15 \times 6/12$ ). If it does not make a reversing entry, when Dapple records this collection it must determine what portion of the interest relates to 2007 (\$66 of Interest Receivable) and what portion is Interest Revenue for 2008 (\$33 for two months). Often this analysis is complex and impractical. The use of a reversing entry eliminates this analysis. The entire amount of the \$99 received in excess of the face value of the note is credited to Interest Revenue. Since the reversing entry created a \$66 *debit* balance in Interest Revenue, the \$99 credit results in a \$33 *credit* balance, the two months of interest for 2008, in the Interest Revenue account.

Similarly, on April 1, 2008 the Dapple Corporation will pay its employees another 6 months of salaries, or \$1,800. If Dapple does not make a reversing entry, when it pays the salaries it must determine what portion of the salary payment relates to 2007 (\$900 of Salaries Payable) and what portion is Salaries Expense for 2008 (\$900 for 3 months). The use of a reversing entry eliminates this analysis. The entire \$1,800 payment is debited to Salaries Expense. When combined with the \$900 *credit* balance in Salaries Expense established by the reversing entry, the result is a \$900 *debit* balance, the amount representing three months of salaries expense for 2008. ♦

### Alternative Procedures

As we indicated in the discussion of the adjusting entry for deferred revenues, some companies initially record the receipt of revenues in advance of being earned as a revenue instead of

**EXAMPLE 3-11 Reversing Entries (Dapple Corporation)**

<b>Accrued Revenue</b>			
<b>Adjusting Entry</b>			
	12/31/07	Interest Receivable	66
		Interest Revenue	66
	12/31/07	Revenues and expenses are CLOSED.	
<i>If reversing entry is not made:</i>		<i>If reversing entry is made:</i>	
<b>Reversing Entry</b>			
1/1/08	None	1/1/08	Interest Revenue 66
			Interest Receivable 66
<b>Subsequent Entry</b>			
3/1/08	Cash	1,419	
	Notes Receivable	1,320	
	Interest Receivable	66	
	Interest Revenue	33	
<b>Analysis of Subsequent Entry</b>			
Interest of \$99 is collected, but \$66 was recorded in Interest Receivable at end of last period. Consequently, Interest Receivable must be credited for \$66 and Interest Revenue credited for \$33.		Interest of \$99 is collected and credited to Interest Revenue. Because reversing entry was made for \$66, the net result in Interest Revenue is a \$33 credit balance.	
<b>Accrued Expense</b>			
<b>Adjusting Entry</b>			
	12/31/07	Salaries Expense	900
		Salaries Payable	900
	12/31/07	Revenues and expenses are CLOSED.	
<i>If reversing entry is not made:</i>		<i>If reversing entry is made:</i>	
<b>Reversing Entry</b>			
1/1/08	None	1/1/08	Salaries Payable 900
			Salaries Expense 900
<b>Subsequent Entry</b>			
4/1/08	Salaries Expense	900	
	Salaries Payable	900	
	Cash		1,800
<b>Analysis of Subsequent Entry</b>			
Salaries of \$1,800 for 6 months are paid, but \$900 was recorded in Salaries Payable at end of last period. Consequently, Salaries Payable must be debited for \$900 and Salaries Expense debited for \$900.		Salaries of \$1,800 for 6 months are paid and debited to Salaries Expense. Because reversing entry was made for \$900, the net result in Salaries Expense is a \$900 debit balance.	

a liability. We showed that Dapple Corporation *could* have recorded the December 1 receipt of three months' advance rent as a credit to Rent Revenue for \$450. In this case the adjusting entry is a debit to Rent Revenue for \$300 and a credit to Unearned Rent for \$300. This adjusting entry creates a balance sheet account and should be reversed. On January 1, 2008 a reversing entry should be made debiting Unearned Rent for \$300 and crediting Rent Revenue for \$300. This entry eliminates the Unearned Rent account balance and creates a \$300 balance in Rent Earned for the two months of 2008. No further adjusting entry is needed in 2008.

## SUBSIDIARY LEDGERS

Even in the relatively simple Dapple Corporation example, the general ledger contains many accounts. For a larger company that sells to many customers and purchases from many suppliers, the general ledger is much larger because the company incurs additional types of expenses and earns other types of revenues. The company also must keep adequate records of amounts owed by each customer and to each supplier.

**10** Use subsidiary ledgers.

To (1) reduce the size of the general ledger, (2) minimize errors, (3) divide the accounting task, and (4) keep up-to-date records of its credit customers and suppliers, a company creates subsidiary ledgers that are *not* part of the double-entry system. A **subsidiary ledger is a group of accounts, all of which relate to one specific company activity.** Most companies have separate subsidiary ledgers for accounts receivable and accounts payable. These ledgers enable a company to better focus on the collection and payment process for the receivables and payables. Many companies also use subsidiary ledgers for major categories of accounts, such as property and equipment, selling expenses, and administrative expenses. The *accounts receivable* subsidiary ledger contains the individual accounts of all the company's credit customers. Since the individual customer accounts have debit balances, this subsidiary ledger has a *total* debit balance (computed by preparing a *schedule* of the individual customer account balances).

When a company uses this subsidiary ledger, it still keeps an Accounts Receivable account in the general ledger. This account is referred to as a **control account** because its debit balance must be equal to that of the subsidiary ledger. In a computerized accounting system, each posting to the Account Receivable control account is also automatically posted to the applicable subsidiary ledger account. Similarly, the *accounts payable* subsidiary ledger contains the individual accounts of all the company's credit suppliers. Since these accounts have credit balances, the credit total of this subsidiary ledger must agree with the credit total of the Accounts Payable control account in the general ledger. If the Dapple Corporation used a subsidiary ledger for the accounts receivable, the ledger and control account balances at the end of 2007 would appear as we show in Example 3-12.

#### EXAMPLE 3-12 Accounts Receivable Control Account and Subsidiary Ledger

Ending Account Balances for 2007

<i>General Ledger</i>	<i>Subsidiary Ledger</i>						
<table style="margin-left: auto; margin-right: auto;"> <tr><td style="text-align: center;">Accounts Receivable</td></tr> <tr><td style="border-top: 1px solid black; text-align: center;">Balance 7,000</td></tr> </table>	Accounts Receivable	Balance 7,000	<table style="margin-left: auto; margin-right: auto;"> <tr><td style="text-align: center;">Frank Company</td></tr> <tr><td style="border-top: 1px solid black; text-align: center;">Balance 3,000</td></tr> <tr><td style="text-align: center;">Knox Company</td></tr> <tr><td style="border-top: 1px solid black; text-align: center;">Balance 4,000</td></tr> </table>	Frank Company	Balance 3,000	Knox Company	Balance 4,000
Accounts Receivable							
Balance 7,000							
Frank Company							
Balance 3,000							
Knox Company							
Balance 4,000							

## SPECIAL JOURNALS

When a company increases in size and complexity, it needs to efficiently record and summarize many daily transactions. Special journals are used for this purpose. A **special journal is a journal used by a company to record its transactions with a similar characteristic.** A company uses these journals (1) to divide the accounting task, (2) to reduce the time needed to complete the various accounting activities, and (3) to provide for a chronological listing of similar transactions. There are four common types of transactions for which special journals are usually established: (1) sales of merchandise on credit, (2) purchases of merchandise on credit, (3) cash receipts, and (4) cash payments. A company still needs a general journal to record various other transactions or events not repetitive enough to require the use of special journals.

The major journals and their uses are:

1. *Sales Journal.* Used to record all (and only) sales of merchandise on credit.
2. *Purchases Journal.* Used to record all (and only) purchases of merchandise on credit.
3. *Cash Receipts Journal.* Used to record all cash receipts.
4. *Cash Payments Journal.* Used to record all cash payments.

**11** Understand special journals.

5. *General Journal*. Used to record adjusting, closing, and reversing entries and other transactions not recorded in the special journals.

Because operating procedures and transactions vary across companies, each company organizes its special journals in a way best suited to its operations.

### SECURE YOUR KNOWLEDGE 3-3

- A worksheet is a tool designed to minimize errors, simplify the recording of adjusting and closing entries in the general journal, and help in preparing financial statements.
- A reversing entry is the exact reverse of an adjusting entry and is used to simplify the recording of a later transaction related to the adjusting entry.
- A subsidiary ledger is a group of accounts for one specific company activity that sums to the total of the related control account in the general ledger.
- Special journals such as the sales journal, purchases journal, cash receipts journal and cash payments journal are tools used to record business transactions with similar characteristics that allow for increased efficiency and effectiveness in the accounting cycle.

## COMPUTER SOFTWARE

In this chapter (and throughout the book) we use a manual accounting system for convenience. In the business world, however, most companies use computer software to process their accounting information. Software has been developed by software companies for the subsidiary ledgers and special journals we discussed earlier, as well as other financial accounting functions relating to accounts receivable, accounts payable, inventory, payroll, and the general ledger. We briefly describe each type of software next.

### Accounts Receivable

Because a company generates much of the cash needed for its operations from the collection of accounts receivable, the software for accounts receivable is a very important aspect of a computer system. Accounts receivable software generally is designed to provide up-to-date balances in customers' accounts by immediately recording invoices and cash receipts from customers; print out monthly statements (bills) for customers; monitor sales returns and allowances as well as sales discounts taken by customers; generate a credit history of each customer to help avoid uncollectible accounts; and provide projections of future cash inflows.

### Accounts Payable

Accounts payable software monitors and controls the cash a company pays to suppliers. In the case of a retailer or wholesaler, payments for purchases of inventory for resale is the primary activity. The software for accounts payable generally is designed to provide up-to-date balances in suppliers' accounts by immediately recording purchase orders and cash payments to suppliers; generate a list to verify the quantity and unit price of an order when it is received from a supplier; monitor purchases returns and allowances and purchases discounts taken; write checks; and provide projections of future cash outflows.

### Inventory

Inventory is a very important asset for many companies. Most inventory software is linked to a company's accounts receivable and accounts payable software. Inventory software generally is designed to provide an up-to-date count of the number of units of each item of

inventory by immediately recording all unit purchases and sales; highlight when a minimum or maximum stock level has been reached for each item of inventory; print price tags for newly acquired inventory; prepare reports on slow-moving or obsolete inventory items; and provide unit prices when a physical count of the inventory is taken.

### Payroll

Software for a company's payroll was one of the first to be developed. Payroll software can be very complex because of the various federal, state, and local tax laws. Payroll software may be designed to compute the salaries earned by each employee based on pay rates and overtime; allocate the salaries across departments in the company; calculate federal, state, and local withholding taxes; compute other voluntary withholdings such as for investments in retirement plans; print payroll checks; generate comparisons of actual with projected salaries; and prepare various tax-withholding reports.

### General Ledger

General ledger software is broader than the name implies and includes many aspects of a company's accounting system. General ledger software usually includes all special journals and the general journal for recording transactions, a chart of accounts, and the ledger accounts on disks for storing the recorded information. Usually, the software is capable of preparing a trial balance and financial statements at any point in time. Frequently, supporting schedules (e.g., depreciation) and budgets also may be generated. The general ledger software of a company usually is linked to its accounts receivable, accounts payable, inventory, and payroll software.

## APPENDIX: CASH-BASIS ACCOUNTING

As we mentioned earlier in this chapter, most companies use accrual accounting. Under *accrual accounting*, a company records revenues in the accounting period in which they are earned and realized, and records expenses in the accounting period they are incurred. A few companies such as small retail stores and professionals such as dentists, doctors, and architects use cash-basis accounting. Under *cash-basis accounting*, a company records revenues when it collects cash from sales and records expenses when it pays cash for its operations. On its income statement, then, the company computes its net income as the difference between its cash receipts and cash payments. In other words, net income is the same as the net operating cash flow for the period. The company may choose not to prepare a balance sheet. However, it frequently will keep track of certain assets such as amounts owed by customers (accounts receivable), amounts paid in advance (prepaid expenses), and any property and equipment it owns. It also frequently will keep track of certain liabilities such as amounts owed to suppliers (accounts payable) and amounts owed to employees (accrued expenses). Cash-basis accounting, however, is not allowed under generally accepted accounting principles.

Sometimes a company that is using cash-basis accounting must prepare its financial statements based on accrual accounting. This might happen, for instance, if it applies for a bank loan and the bank requires financial statements prepared using generally accepted accounting principles. In this case, the company must convert its cash-basis income statement to an accrual-basis income statement and must prepare a related balance sheet. This involves making adjustments to the cash receipts to convert them to sales revenues and making adjustments to the cash payments to convert them to cost of goods sold and operating expenses. It also involves combining the information it has about its assets and liabilities into a formal balance sheet.

Exhibit 3-4 shows the basic adjustments that a company must make to convert its cash receipts and cash payments into accrual-based revenues, cost of goods sold, and operating expenses. In addition, the company must include depreciation expense on its property and equipment in the operating expenses.

**12** Convert cash-basis financial statements to accrual-basis.

**EXHIBIT 3-4 Adjustments to Convert Cash-Basis to Accrual-Basis Accounting**

Cash Basis	→ Adjustments	→ Accrual Basis
Collections from customers	{ + Ending accounts receivable - Beginning accounts receivable }	= Sales revenue
Payments to suppliers	{ + Beginning inventory - Ending inventory + Ending accounts payable - Beginning accounts payable }	= Cost of goods sold
Payments for other operating costs	{ + Beginning prepaid expenses - Ending prepaid expenses + Ending accrued expenses - Beginning accrued expenses }	= Operating expenses (except depreciation)

**Example: Cash-Basis Accounting**

Assume that Gretta Gropples starts Gropples Company (a small retail store organized as a sole proprietorship) on January 1, 2007 by investing cash of \$20,000. Gropples Company uses cash-basis accounting but wants to prepare its financial statements on an accrual basis. At the end of the year, the company's checkbook shows cash receipts from customers of \$95,000, cash payments of \$106,000, and an ending cash balance of \$9,000. Based on a physical inventory, the company determined that its inventory at the end of 2007 is \$7,200. It also determined that at the end of 2007, customers owed it \$4,300, and that it owed suppliers \$5,100 and employees \$500. The company examined its checkbook and found that during 2007:

1. It paid suppliers \$54,000 and paid other operating costs of \$29,000. Included in the other operating costs was \$6,000 that it paid on January 1 for two years of rent on store space.
2. It paid \$8,000 for store equipment on January 1. It planned to use straight-line depreciation and expected to use the store equipment for five years, after which the store equipment would have a zero residual value.
3. Gretta withdrew \$15,000 during the year.

Based on this information, using accrual accounting the company prepared its income statement for 2007 that we show in Example 3-13 and its balance sheet at the end of 2007 that we show in Example 3-14.

In Example 3-13, Gropples Company computed its \$99,300 sales revenues by adding the \$4,300 ending accounts receivable to the \$95,000 it collected from customers. The company computed its \$51,900 cost of goods sold by subtracting the \$7,200 ending inventory and adding the \$5,100 ending accounts payable to the \$54,000 it paid to suppliers. It computed the \$26,500 other operating expenses by subtracting the \$3,000 prepaid rent (the cost of the remaining year of rent it had paid for in advance) and adding the \$500 ending salaries payable to the \$29,000 it paid for other operating costs. It computed the \$1,600 depreciation expense by dividing the \$8,000 cost of the store equipment by the five-year estimated life.

In Example 3-14, most of the amounts come from the initial information we presented for the company. The \$1,600 accumulated depreciation is the depreciation to date (one year, in this example; in later years, this amount would increase each year by the amount of the annual depreciation expense). The company computed the \$24,300 amount of the G. Gropples capital account by adding the \$19,300 net income and subtracting the \$15,000 withdrawals from the \$20,000 initial investment.

In more complex situations, a company may have items such as deferred revenues and accrued revenues, sales returns and allowances, purchases returns and allowances,

**EXAMPLE 3-13 Income Statement (Gropgles Company)****GROPPLER COMPANY****Income Statement  
For Year Ended December 31, 2007**

Sales revenue		\$99,300 <sup>a</sup>
Cost of goods sold		<u>(51,900)<sup>b</sup></u>
Gross profit		\$47,400
Operating expenses		
Depreciation expenses	\$ 1,600 <sup>d</sup>	
Other operating expenses	<u>26,500<sup>c</sup></u>	
Total expenses		<u>(28,100)</u>
Net Income		<u>\$19,300</u>

<sup>a</sup>\$95,000 collections from customers + \$4,300 ending accounts receivable.

<sup>b</sup>\$54,000 payments to suppliers – \$7,200 ending inventory + \$5,100 ending accounts payable.

<sup>c</sup>\$29,000 payments for other operating costs – \$3,000 ending prepaid rent ( $\$6,000 \times 1/2$ ) + \$500 ending salaries payable.

<sup>d</sup>\$8,000 store equipment  $\div$  5 years.

and interest revenue and expense, as well as gains or losses on sales of equipment. In these cases the company may make additional adjustments to determine its revenues and expenses, and may provide more detail in the revenues, cost of goods sold, and operating expenses sections of its income statement. For convenience, the company may prepare a worksheet to help it determine these amounts. Regardless of how simple or complex the adjustments are, the intent is to report the company's financial statements on an accrual basis according to generally accepted accounting principles. ♦

**EXAMPLE 3-14 Balance Sheet (Gropgles Company)****GROPPLER COMPANY****Balance Sheet  
December 31, 2007**

<b>Assets</b>		<b>Liabilities</b>	
<b>Current Assets</b>		<b>Current Liabilities</b>	
Cash	\$ 9,000	Accounts payable	\$ 5,100
Accounts receivable	4,300	Salaries payable	<u>500</u>
Inventory	7,200	Total liabilities	\$ 5,600
Prepaid rent	<u>3,000</u>		
Total current assets	\$23,500	<b>Owner's Equity</b>	
Property and Equipment		G. Gropgles, capital	\$24,300 <sup>a</sup>
Store equipment	\$ 8,000		
Less: Accumulated depreciation	<u>(1,600)</u>		
Total property and equipment	6,400		
Total Assets	<u>\$29,900</u>	Total Liabilities	<u>\$29,900</u>

<sup>a</sup>\$20,000 beginning investment + \$19,300 net income (from Example 3-13) – \$15,000 withdrawals.

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

1. **Understand the components of an accounting system.** The components of an accounting system include: (1) the framework for operating the system, (2) the input source documents, (3) the records used to store accounting information, and (4) the output reports.
2. **Know the major steps in the accounting cycle.** The major steps in the accounting cycle include: (1) recording (journalizing) daily transactions in a journal, (2) posting the journal entries to the accounts in the general ledger, (3) preparing and posting adjusting entries, (4) preparing the financial statements, and (5) preparing and posting closing entries for the revenue, expense, and dividend accounts.
3. **Prepare journal entries in the general journal.** To make a journal entry to record a transaction, enter the date in the date column. Next, enter the title of the account and amount to be debited in the account titles column and debit column, respectively. Then, enter the title of the account and amount to be credited in the account titles column and credit column, respectively. Finally, write a short explanation of the transaction in the account titles column.
4. **Post to the general ledger and prepare a trial balance.** To post to the general ledger, for each journal entry, first transfer from the general journal the date and the amount debited to the account in the general ledger. Next, transfer the date and the amount credited to the account in the general ledger. To prepare a trial balance at the end of the accounting period, first compute the balance in each account. Then, list each account and list its balance in the debit or credit column of the working paper (trial balance). Finally, total the debit and credit columns to verify that the totals are equal.
5. **Prepare adjusting entries.** Adjusting entries are journal entries made at the end of the accounting period so that a company's financial statements include the correct amounts for the current period. Adjusting entries are made to: (1) apportion prepaid and deferred items, (2) record accrued items, and (3) record estimated items. Adjusting entries are made in the usual manner in the general journal.
6. **Prepare financial statements.** To prepare a company's financial statements, first prepare an adjusted trial balance to verify that the total of the debit balances is equal to the total of the credit balances in the company's accounts. Then, prepare the income statement, which includes the company's revenues, expenses, and net income. Next, prepare the retained earnings statement, which shows the change in retained earnings because of the company's net income and dividends. Finally, prepare the balance sheet, which includes the company's assets, liabilities, and stockholders' equity.
7. **Prepare closing entries.** Closing entries are journal entries of a company made at the end of the accounting period (1) to reduce the balance in each temporary account (revenue, expense, and dividend accounts) to zero, and (2) to update the retained earnings account. Closing entries are made in the usual manner in the general journal.
8. **Complete a worksheet (spreadsheet).** To complete a worksheet, first list each account and list its balance in the debit or credit column of the trial balance. Second, enter the adjusting entries as debits or credits in the adjustments columns. Third, combine the trial balance amount of each account with the adjustments to that account and carry over the resulting amount to the proper column of the financial statement in which the account is included. Fourth, subtotal the income statement debit and credit columns, make an adjusting entry for any income taxes on the difference between the columns (the pretax income), and carry the adjustment amounts to the appropriate financial statement columns. Finally, subtotal the income statement columns. List the difference as net income (or net loss), write the amount in the debit (credit) column and balance the income statement columns. Transfer the net income (net loss) amount to the retained earnings columns and balance these columns. Then transfer the retained earnings balance to the balance sheet credit column and balance these columns.
9. **Prepare reversing entries.** A reversing entry is the exact reverse (accounts and amounts) of an adjusting entry. Reversing entries are made at the end of an accounting period to simplify the recording of later transactions. A reversing entry enables a company to routinely record the later transaction without having to consider the possible impact of the prior adjusting entry.
10. **Use subsidiary ledgers.** A subsidiary ledger is a group of accounts, all of which pertain to one specific company activity. Most companies have subsidiary ledgers for accounts receivable and accounts payable to better focus on collections from customers and payments for payables. When a company uses a subsidiary ledger it still maintains a *control account* in its general ledger. The balance of the control account must be equal to the total of the balances of all the individual accounts in the subsidiary ledger.
11. **Understand special journals.** The major special journals are the: (1) sales journal (for sales on credit), (2) purchases journal (for purchases on credit), (3) cash receipts journal, (4) cash payments journal, and (5) general journal (for miscellaneous transactions).

12. **Convert cash-basis financial statements to accrual-basis (Appendix).** First, start with the income statement. Make adjustments to the collections from customers for any changes in accounts receivable. Make adjustments to the payments to suppliers for any changes in inventory and accounts payable. Make adjustments to the payments for other operating costs for any changes in prepaid expenses or accrued expenses, and for depreciation expense. Complete the accrual-basis income statement using the resulting amounts. Use the cash balance from the company's checkbook and the information from the preceding adjustments (e.g., accounts receivable, accounts payable, etc.) to prepare the ending balance sheet.

## QUESTIONS

- Q3-1** What is a primary objective of financial reporting?
- Q3-2** What is an *accounting system*?
- Q3-3** Discuss the relationship between the accounting equation and the double-entry system of recording transactions.
- Q3-4** What is the difference between a *permanent* and a *temporary* account? Give examples of each.
- Q3-5** What are the major financial statements of a company and what information does each summarize?
- Q3-6** Define the following:
- Account*
  - Contra account*
  - Ledger*
  - Journal*
  - Posting*
- Q3-7** Why is it advantageous to a company to initially record each of its transactions in a journal?
- Q3-8** What is a perpetual accounting system? What journal entries are involved?
- Q3-9** Give examples of transactions that:
- Increase an asset and a liability.
  - Increase an asset and stockholders' equity.
  - Increase an asset and decrease an asset.
  - Decrease an asset and a liability.
  - Decrease an asset and stockholders' equity.
- Q3-10** Give examples of transactions that:
- Increase inventory account and a liability.
  - Decrease inventory account and a liability.
  - Increase inventory account and decrease an asset.
  - Decrease inventory account and increase an asset.
- Q3-11** What are the steps that a company completes in the accounting cycle? Briefly discuss each step.
- Q3-12** Why are adjusting entries necessary?
- Q3-13** What are *prepaid expenses* and *deferred revenues*? Give an example of an adjusting entry to update each of these items at year-end.
- Q3-14** What are *accrued expenses* and *accrued revenues*? Give an example of an adjusting entry to record each of these items.
- Q3-15** Give two examples of adjusting entries to record estimated items. Include in one example a discussion of how depreciation is computed.
- Q3-16** What is the difference between a *trial balance* and an *adjusted trial balance*? Why is the latter a useful accounting working paper?
- Q3-17** What is the difference between a sales return and a sales discount? How does each affect net sales?
- Q3-18** What is a periodic inventory system? How is cost of goods sold computed when a company uses a periodic inventory system?
- Q3-19** What are the objectives of closing entries?
- Q3-20** Show, without amounts, the form of the closing entries for a retail store using a perpetual inventory system.
- Q3-21** What is a *worksheet*? How does the use of a worksheet facilitate the completion of the accounting cycle?
- Q3-22** What are *reversing entries* and why are they used? Give an example of an adjusting entry and a reversing entry for salaries payable, and the later entry to pay the salaries.
- Q3-23** What is a *subsidiary ledger* and a *control account*, and why are they used? Give an example of how they work.
- Q3-24** What are *special journals* and what advantages are achieved by using them?
- Q3-25** What are the major special journals? Give an example of transactions that would be recorded in each journal.
- Q3-26** Identify the common software for the financial accounting functions.
- Q3-27** What is cash-basis accounting? What must a company do to convert its cash-basis accounting records to an accrual-based income statement?

## EXERCISES

**E3-1 Financial Statement Interrelationship** Draw a diagram that shows the interrelationship between the beginning balance sheet, income statement, retained earnings statement, and ending balance sheet.

**E3-2 Journal Entries** The Mead Company uses a perpetual inventory system and engaged in the following transactions during the month of May:

Date	Transaction
May 1	Made cash sales of \$6,300; the cost of the inventory was \$3,700.
5	Purchased \$2,000 of inventory on credit.
9	Made credit sales of \$3,300; the cost of the inventory sold was \$1,900.
13	Paid sales salaries of \$900 and office salaries of \$600.
14	Paid for the May 5 purchases.
18	Purchased sales equipment costing \$8,000; made a down payment of \$2,000 and agreed to pay the balance in 60 days.
21	Purchased \$600 of inventory for cash.
27	Sold land that had originally cost \$1,900 for \$2,600.

### Required

Record the preceding transactions in a general journal.

**E3-3 Journal Entries** The following are selected accounts and account balances of the Sawyer Company on May 31:

	Debit (Credit)
Cash	\$12,523
Accounts receivable	23,052
Inventory	16,300
Office equipment	35,860
Accumulated depreciation	(10,540)
Notes payable	(3,400)
Accounts payable	(3,500)
Sales revenue	(47,872)
Gain on sale of office equipment	(400)
Cost of goods sold	22,354
Utility expense	1,124

The Sawyer Company entered into the following transactions during June:

Date	Transaction
June 3	Sold for \$700 office equipment that had cost \$2,000 and has associated accumulated depreciation of \$1,500.
7	Made sales of \$2,000 on credit; the cost of the inventory sold was \$1,200.
10	Purchased \$1,000 of inventory for cash.
15	Purchased new office equipment costing \$4,000, paying \$1,500 and signing a 90-day note for the balance.
16	Received check for June 7 credit sale.
17	Made cash sales of \$4,200; the cost of the inventory sold was \$2,300.
20	Purchased \$2,600 of inventory on credit.
24	Returned \$200 of defective inventory from the June 20 purchase for a credit to its account.
29	Paid for the June 20 purchase less the return.
30	Paid the monthly utility bill, \$210.

### Required

- Record the preceding transactions in a general journal.
- Post to the accounts.

**E3-4 Basic Income Statement** The following are selected account balances of the Rule Corporation at the end of 2007:

	Debit	Credit
Operating expenses	\$3,800	
Sales returns	600	
Sales revenue		\$16,200
Cost of goods sold	8,300	
Interest expense	800	
Gain on sale of land		500

The company is subject to a 30% income tax rate and stockholders own 800 shares of its capital stock.

**Required**

Prepare a 2007 income statement for Rule Corporation.

**E3-5 Periodic Inventory System** Raynolde Company uses a periodic inventory system. At the end of 2007, the following information is available:

Purchases returns and allowances	\$ 1,400
Inventory, 12/31/2007	11,900
Purchases	21,200
Inventory, 1/1/2007	10,800
Purchases discounts	600

**Required**

Prepare a schedule to compute Raynolde Company's cost of goods sold for 2007.

**E3-6 Financial Statements** The Turtle Company has prepared the following adjusted trial balance for the year ended December 31, 2007:

	Debit	Credit
Cash	\$ 1,700	
Accounts receivable (net)	2,100	
Inventory	1,800	
Equipment	5,400	
Accumulated depreciation		\$ 1,700
Accounts payable		2,300
Salaries payable		300
Income taxes payable		360
Capital stock (400 shares)		3,200
Retained earnings		2,500
Dividends distributed	200	
Sales revenue		7,900
Cost of goods sold	4,300	
Selling expenses	1,800	
Administrative expenses	600	
Income tax expense	360	
Totals	<u>\$18,260</u>	<u>\$18,260</u>

**Required**

Prepare for 2007 in proper form: (1) an income statement, (2) a retained earnings statement, (3) an ending balance sheet, and (4) closing entries.

**E3-7 Adjusting Entries** Your examination of the records of the Sullivan Company provides the following information for the December 31, 2007 year-end adjustments:

1. Bad debts are to be recorded at 2% of sales. Sales totaled \$25,000 for the year.
2. Salaries at year-end that have accumulated but have not been paid total \$1,400.
3. Annual straight-line depreciation for the company's equipment is based on a cost of \$30,000, an estimated life of eight years, and an estimated residual value of \$2,000.
4. Prepaid insurance in the amount of \$800 has expired.
5. Interest that has been earned but not collected totals \$500.
6. Unearned rent in the amount of \$1,000 has become earned.

7. Interest on a note payable that has accumulated but has not been paid totals \$600.
8. The income tax rate is 30% on current income and is payable in the first quarter of 2008. The pretax income before the preceding adjusting entries is \$6,800.

**Required**

Prepare the adjusting entries to record the preceding information.

**E3-8 Adjusting Entries** The following are several transactions of the Pruitt Company that occurred during the current year and were recorded in *real* (that is, balance sheet) accounts unless indicated otherwise:

Date	Transaction
Apr. 1	Purchased a delivery van for \$10,000, paying \$1,000 down, and issuing a one-year, 12% note payable for the \$9,000 balance. It is estimated that the van has a four-year life and an \$800 residual value; the company uses straight-line depreciation. The interest on the note will be paid on the maturity date.
May 15	Purchased \$830 of office supplies.
June 2	Purchased a two-year comprehensive insurance policy for \$960.
Aug. 1	Received six months' rent in advance at \$260 per month and recorded the \$1,560 receipt as Rent Earned.
Sept. 15	Advanced \$600 to sales personnel to cover their future travel costs.
Nov. 1	Accepted a \$6,000, six-month, 12% (annual rate) note receivable from a customer, the interest to be collected when the note is collected.

The following information also is available:

1. On January 1, the Office Supplies account had a \$250 balance. On December 31, an inventory count showed \$190 of office supplies on hand.
2. The weekly (five-day) payroll of Pruitt Company amounts to \$2,000. All employees are paid at the close of business each Wednesday. A two-day accrual is required for the current year.
3. Sales personnel travel cost reports indicate that \$490 of advances had been used to pay travel expenses.
4. The income tax rate is 30% on current income and is payable in the first quarter of next year. The pretax income before the adjusting entries is \$8,655.

**Required**

On the basis of the above information, prepare journal entries to record whatever *adjustments* are necessary to bring the accounts up to date on December 31. Each journal entry explanation should show any related computations.

**E3-9 Adjusting Entries** The following partial list of accounts and account balances has been taken from the trial balance and the adjusted trial balance of the Barker Company:

	Trial Balance		Adjusted Trial Balance	
	Debit	Credit	Debit	Credit
Accumulated depreciation		\$5,200		\$6,600
Allowance for doubtful accounts		380		650
Income taxes payable		0		2,250
Interest payable		0		320
Prepaid insurance	\$350		\$90	
Salaries payable		0		720
Unearned rent		900		300

**Required**

Prepare the adjusting entry that caused the change in each account balance.

**E3-10 Closing Entries** The Collins Corporation shows the following inventory, dividends, revenue, and expense account balances before closing:

	Debit	Credit		Debit	Credit
Dividends distributed	\$ 250		Gain on sale of land		\$300
Sales revenue		\$2,400	Salaries expense	\$300	
Sales returns	200		Utilities expense	130	
Cost of goods sold	1,350		Miscellaneous expenses	120	
			Income tax expense	180	

**Required**

Prepare closing entries.

**E3-11 Worksheet for Service Company** The Grant Consulting Company has prepared a trial balance on the following partially completed worksheet for the year ended December 31, 2007:

	A	B	C	D	E	F	G	H	I	J	K
1								Retained			
2						Income		Earnings		Balance	
3		Trial Balance		Adjustments		Statement		Statement		Sheet	
4	Accounts	Debit	Credit	Debit	Credit	Debit	Credit	Debit	Credit	Debit	Credit
5	Cash	3,800									
6	Prepaid rent	2,400									
7	Office equipment	7,000									
8	Accumulated depreciation		1,400								
9	Notes payable (due 7/1/08)		2,000								
10	Capital stock (200 shares)		4,000								
11	Retained earnings (1/1/07)		3,200								
12	Dividends distributed	200									
13	Consulting revenues		6,100								
14	Salaries expense	2,500									
15	Miscellaneous expenses	800									
16	Totals	16,700	16,700								
17											

*Additional information:* (a) On January 1, 2007 the company had paid two years' rent in advance at \$100 a month on its office space, (b) the office equipment is being depreciated on a straight-line basis over a 10-year life, and no residual value is expected, (c) interest of \$150 has accrued on the note payable but has not been paid, and (d) the income tax rate is 30% on current income and will be paid in the first quarter of 2008.

**Required** 

1. Complete the worksheet.
2. Prepare financial statements for 2007.

**E3-12 Worksheet, Including Inventory** The Murphy Company prepared a trial balance on the following partially completed worksheet for the year ended December 31, 2007:

	A	B	C	D	E	F	G	H	I	J	K
1								Retained			
2						Income		Earnings		Balance	
3		Trial Balance		Adjustments		Statement		Statement		Sheet	
4	Accounts	Debit	Credit	Debit	Credit	Debit	Credit	Debit	Credit	Debit	Credit
5	Cash	2,500									
6	Accounts receivable	4,000									
7	Allowance for doubtful accounts		300								
8	Inventory	8,200									
9	Prepaid rent	3,600									
10	Equipment	30,000									
11	Accumulated depreciation		12,000								
12	Accounts payable		3,700								
13	Notes payable (due 7/1/08)		5,000								
14	Capital stock (1,000 shares)		8,900								
15	Retained earnings (1/1/07)		10,200								
16	Dividends distributed	1,000									
17	Sales revenues		45,000								
18	Cost of goods sold	21,000									
19	Salaries expense	7,100									
20	Utilities expense	3,300									
21	Advertising expense	4,400									
22	Totals	85,100	85,100								
23											

*Additional information:* (a) The equipment is being depreciated on a straight-line basis over a 10-year life, with no residual value; (b) salaries accrued but not recorded total \$500; (c) on January 1, 2007 the company had paid three years' rent in advance at \$100 per month; (d) bad debts are expected to be 1% of total sales; (e) interest of \$400 has accrued on the note payable; and (f) the income tax rate is 40% on current income and will be paid in the first quarter of 2008.

**Required** 

1. Complete the worksheet.
2. Prepare financial statements for 2007.
3. Prepare closing entries in the general journal.

**E3-13 Reversing Entries** On December 31, 2007 Adams Company made the following adjusting entries for its annual accounting period:

Depreciation Expense	2,400	
Accumulated Depreciation		2,400
To record depreciation on buildings.		
Interest Receivable	500	
Interest Revenue		500
To record interest on note receivable due January 28, 2008.		
Rent Expense	400	
Prepaid Rent		400
To record expired prepaid rent.		
Interest Expense	620	
Interest Payable		620
To record interest on note payable due March 16, 2008.		

#### Required

Prepare whatever reversing entries are appropriate.

**E3-14 Special Journals** The following are several transactions of a company that uses special journals:

Transaction	Journal
1. Purchase of inventory for cash.	_____
2. Sale of inventory on credit.	_____
3. Payment of sales salaries.	_____
4. Purchase of inventory on credit.	_____
5. Sale of merchandise for cash.	_____
6. Purchase of land by issuing note payable.	_____
7. Collection of short-term note receivable and related interest.	_____
8. Return of defective inventory to supplier for credit to account.	_____
9. Preparation of adjusting entries.	_____
10. Purchase of equipment for cash.	_____

#### Required

In the space provided, indicate in which journal the transaction would be recorded using the codes: *G* for general journal, *S* for sales journal, *P* for purchases journal, *CR* for cash receipts journal, and *CP* for cash payments journal.

**E3-15 Cash-Basis Accounting (Appendix)** Ellis Company keeps its accounting records on a cash basis during the year. At year-end, it adjusts its books to the accrual basis for preparing its financial statements. At the end of 2006, Ellis Company reported the following balance sheet items:

	<u>Debit</u>	<u>Credit</u>
Cash	\$ 2,700	
Accounts receivable	4,200	
Inventory	5,600	
Equipment	12,000	
Accumulated depreciation		\$ 4,800
Accounts payable		6,100
M. Ellis, capital		<u>13,600</u>
Totals	<u>\$24,500</u>	<u>\$24,500</u>

It is now the end of 2007. The company's checkbook shows a balance of \$4,700, which includes cash receipts from customers of \$51,300 and cash payments of \$49,300.

An examination of the cash payments show that: (1) \$30,600 was paid to suppliers, (2) \$12,700 was paid for other operating costs (including \$7,200 paid on January 1 for two years' annual rent), and (3) \$6,000 was withdrawn by M. Ellis.

On December 31, 2007, (1) customers owed Ellis Company \$5,900, (2) Ellis Company owed suppliers and employees \$7,000 and \$900, respectively, and (3) the ending inventory was \$6,300. Ellis is depreciating the equipment using straight-line depreciation over a 10-year life (no residual value).

### Required

Using accrual-based accounting, prepare (1) a 2007 income statement and (2) a December 31, 2007 balance sheet (show supporting calculations).

## PROBLEMS

**P3-1** *Journal Entries, Posting, and Trial Balance* The account balances of the Antil Company on November 1, 2007 are as follows:

	Debit	Credit		Debit	Credit
Cash	\$ 7,800		Patents	\$25,000	
Accounts receivable	12,530		Accounts payable		\$38,750
Allowance for doubtful accounts		\$ 740	Notes payable		2,400
Notes receivable	6,000		Common stock, no par		165,000
Inventory	25,121		Retained earnings, January 1, 2007		24,958
Prepaid insurance	840		Sales revenue		38,400
Office supplies	465		Sales returns and allowances	1,567	
Land	74,350		Cost of goods sold	32,000	
Buildings	66,580		Sales salaries expense	6,200	
Accumulated depreciation:			Office salaries expense	4,300	
buildings		21,400	Advertising expense	1,250	
Equipment	37,620		Utility expense	1,845	
Accumulated depreciation:			Interest revenue		550
equipment		11,480	Interest expense	210	

During the month of November, the following transactions took place:

Date	Transaction
Nov. 2	Made cash sales of \$3,400; the cost of the inventory sold was \$2,040.
3	Purchased \$900 of inventory for cash.
5	Sold an unused 1/2 acre of land for \$4,000; the land had originally cost \$3,650.
8	Purchased a two-year comprehensive insurance policy for \$528.
12	Leased an unused portion of its building to Charles Company, collecting six months' rent in advance at \$220 per month.
13	Made \$2,300 of sales on credit to Smith Company; the cost of the inventory sold was \$1,400.
16	Collected the \$200 monthly payment plus \$30 interest on a customer's note receivable.
17	Purchased \$1,600 of inventory on credit from Mason Company.
19	Granted Smith Company a \$200 allowance for defective inventory (from the November 13 transaction) and credited its account.
20	Purchased land for a future building site. Made a \$2,000 down payment and signed a 12%, 90-day \$6,000 note payable for the balance.
23	Collected the Smith Company account for the November 13 sale less the return.
26	Paid for the November 17 purchase of inventory.
27	Paid the city newspaper \$420 for advertising that had appeared during November.
30	Paid \$520 of sales salaries and \$390 of office salaries.

### Required

1. Prepare general journal entries to record the preceding transactions.
2. Post to the general ledger accounts.
3. Prepare a trial balance on November 30, 2007.

**P3-2 Financial Statements** The Stern Company uses a perpetual inventory system and has prepared the following *adjusted trial balance* on December 31, 2007:

	Debit	Credit
Cash	\$ 2,000	
Accounts receivable	2,700	
Allowance for doubtful accounts		\$ 250
Inventory	6,500	
Prepaid insurance	800	
Land	5,200	
Buildings and equipment	31,000	
Accumulated depreciation		15,000
Accounts payable		3,100
Salaries payable		420
Unearned rent		360
Income taxes payable		2,625
Note payable (due July 1, 2011)		5,000
Interest payable (due July 1, 2011)		750
Capital stock (1,500 shares)		9,000
Retained earnings, January 1, 2007		6,770
Dividends distributed	1,200	
Sales revenue		33,000
Sales returns	2,100	
Rent revenue		1,440
Cost of goods sold	15,040	
Selling expenses	4,800	
Administrative expenses	3,000	
Interest expense	750	
Income tax expense	2,625	
Totals	<u>\$77,715</u>	<u>\$77,715</u>

### Required

Prepare in proper form for 2007 the company's: (1) income statement, (2) retained earnings statement, (3) ending balance sheet, and (4) closing entries in its general journal.

**P3-3 Financial Statements** The Nealy Company has prepared the following alphabetical *adjusted trial balance* on December 31, 2007:

	Debit	Credit
Accounts payable		\$ 6,400
Accounts receivable	\$ 5,700	
Accumulated depreciation: buildings		19,000
Accumulated depreciation: equipment		11,000
Additional paid-in capital		15,000
Administrative expenses	6,500	
Allowance for doubtful accounts		600
Buildings	42,000	
Capital stock, \$1 par (4,000 shares)		4,000
Cash	5,000	
Cost of goods sold	27,400	
Current income taxes payable		4,035
Dividends distributed	2,400	
Equipment	22,000

Unexpired insurance	1,600	
Wages payable		1,000
	\$149,485	\$149,485

### Required

Prepare the following 2007 items in proper form for the Nealy Company: (1) the income statement, (2) the retained earnings statement, (3) the ending balance sheet, and (4) the closing entries in the general journal. (*Hint:* For the ending balance sheet, the Capital Stock, Additional Paid-in Capital, and Retained Earnings accounts are summed to determine the total stockholders' equity.)

**P3-4 Adjusting Entries** The following 2007 information is available concerning the Drake Company, which adjusts and closes its accounts every December 31:

- Salaries accrued but unpaid total \$2,840 on December 31, 2007.
- The \$247 December utility bill arrived on December 31, 2007 and has not been paid or recorded.
- Buildings with a cost of \$78,000, 25-year life, and \$9,000 residual value are to be depreciated; equipment with a cost of \$44,000, eight-year life, and \$2,000 residual value is also to be depreciated. The straight-line method is to be used.
- A count of supplies indicates that the Store Supplies account should be reduced by \$128 and the Office Supplies account reduced by \$397 for supplies used during the year.
- The company holds a \$6,000, 12% (annual rate), six-month note receivable dated September 30, 2007 from a customer. The interest is to be collected on the maturity date.
- Bad debts expense is estimated to be 1% of annual sales. 2007 sales total \$65,000.
- An analysis of the company insurance policies indicates that the Prepaid Insurance account is to be reduced for the \$528 of expired insurance.
- A review of travel expense reports indicates that \$310 advanced to sales personnel (and recorded as Travel Expenses) has not yet been used by these personnel.
- The income tax rate is 30% on current income and will be paid in the first quarter of 2008. The pretax income of the company before adjustments is \$18,270.

### Required

Journalize the necessary adjusting entries for the company at the end of 2007. Show supporting calculations in your journal entry explanations.

**P3-5 Adjusting Entries** The Franklin Retail Company entered into the following transactions during 2007. [The transactions were properly recorded in *real* (balance sheet) accounts unless otherwise indicated.]

Date	Transaction
Jan. 25	Purchased \$480 of office supplies.
Feb. 1	Rented a warehouse from Tropple Company, paying one year's rent of \$3,600 in advance. Recorded the \$3,600 payment as rent expense.
Mar. 1	Borrowed \$10,000 from the bank, signing a one-year note at an annual interest rate of 12%. The interest was collected in advance by the bank. The company recorded the transaction as a debit to Cash \$8,800, debit to Interest Expense \$1,200, and credit to Notes Payable \$10,000.
May 1	Purchased office equipment for \$15,000, paying \$3,000 down and signing a two-year, 12% (annual rate) note payable for the balance. The office equipment is expected to have a useful life of 10 years and a residual value of \$1,500. Straight-line depreciation is appropriate.

Date	Transaction
May 31	Purchased a three-year comprehensive insurance policy for \$720.
Aug. 1	Sold land for \$9,000. The purchaser made a \$2,000 down payment and signed a one-year, 10% note for the balance. The interest and principal will be collected on the maturity date.
Oct. 1	Rented a portion of the retail floor space to a florist for \$120 per month, collecting eight months' rent in advance. Recorded the \$960 receipt as rent revenue.
Nov. 13	Issued checks to sales personnel totaling \$900. The checks are advances for expected travel costs during the remainder of the year.

On December 31, 2007 the following additional information is available:

- Property taxes for 2007 are due to be paid by April 1, 2008. The company has not paid or recorded its \$2,300 property taxes for 2007.
- The \$302 December utility bill has not been recorded or paid.
- Salaries accrued but not paid total \$927.
- Travel cost reports indicate that \$787 of travel advances have been used to pay travel expenses.
- The Office Supplies account had a balance of \$129 on January 1, 2007. A physical count on December 31, 2007 showed \$174 of office supplies on hand.
- On January 1, 2007 the Buildings account and the Store Equipment account had balances of \$100,000 and \$65,000, respectively. The buildings are expected to have an \$8,000 residual value, while the store equipment is expected to have a \$2,000 residual value at the end of their respective lives. They are being depreciated using the straight-line method over 20- and 10-year lives, respectively.
- The income tax rate is 30% on current income and is payable in the first quarter of 2008. The pretax income of the company before adjustments is \$27,749.

#### Required

On the basis of the preceding information, prepare journal entries to adjust the company's books as of December 31, 2007. Each entry explanation should include supporting computations. (Round to the nearest dollar.)

**P3-6** *Adjusting Entries* At the end of 2007 the Ritter Company prepared a trial balance, recorded and posted its adjusting entries, and then prepared an adjusted trial balance. Selected accounts and account balances from the trial balance and adjusted trial balance are as follows:

	Partial Trial Balance		Partial Adjusted Trial Balance	
	Debit	Credit	Debit	Credit
Depreciation expense	\$ 0		\$3,960	
Interest payable (due May 14, 2009)		\$ 0		\$ 810
Bad debts expense	0		410	
Utilities expense	1,480		1,682	
Rental revenue		1,650		2,635
Income tax expense	0		2,740	
Prepaid insurance	1,742		1,380	
Office salaries payable		0		540
Rent expense	0		800	
Accumulated depreciation		14,820		18,780
Interest receivable (due March 1, 2008)	0		320	
Prepaid rent	1,600		800	
Office salaries expense	5,600		6,140	
Income taxes payable		0		2,740
Insurance expense	300		662	
Allowance for doubtful accounts		130		540
Interest expense	0		810	
Unearned rent		600		0
Utilities payable		0		202
Interest revenue		620		940

	Partial Trial Balance		Partial Adjusted Trial Balance	
	Debit	Credit	Debit	Credit
Sales salaries expense	7,300		7,850	
Office supplies	1,150		700	
Rent receivable	0		385	
Advances to salespersons	770		220	
Office supplies expense	0		450	

**Required**

- By comparing the partial trial balance to the partial adjusted trial balance, determine the adjusting entries that the company made on December 31, 2007. Prepare your answers in general journal form.
- Assuming that the company uses reversing entries, indicate which adjusting entries should be reversed.

**P3-7 Adjusting Entries** The trial balance of the Trishia Company on December 31, 2007 (the end of its *annual* accounting period) included the following account balances *before* adjustments:

Notes receivable	\$ 10,000 debit
Insurance expense	3,000 debit
Delivery equipment	14,000 debit
Building	60,000 debit
Unearned rent	4,320 credit
Notes payable	7,200 credit
Office supplies expense	1,000 debit

Reviewing the company's recorded transactions and accounting records for 2007, you find the following data pertaining to the December 31, 2007 adjustments:

- On July 2, 2007 the company had accepted a \$10,000, nine-month, 10% (annual rate) note receivable from a customer. The interest is to be collected when the note is collected.
- On August 2, 2007 the company had paid \$3,000 for a two-year insurance policy.
- The building was acquired in 1995 and is being depreciated using the straight-line method over a 25-year life. It has an estimated residual value of \$8,000.
- The delivery equipment was purchased on April 2, 2007. It is to be depreciated using the straight-line method over a 10-year life, with an estimated residual value of \$2,000.
- On September 1, 2007 the company had received two years' rent in advance (\$4,320) for a portion of a building it is renting to Oscar Company.
- On December 1, 2007 the company had issued a \$7,200, three-month, 12% (annual rate) note payable to a supplier. The interest is to be paid when the note is paid.
- On January 2, 2007 the company purchased \$1,000 of office supplies. A physical count on December 31, 2007 revealed that there are \$400 of office supplies still on hand. No supplies were on hand at the beginning of the year.

**Required**

Prepare the adjusting entries that are necessary to bring the Trishia Company accounts up to date on December 31, 2007. Each journal entry explanation should summarize your calculations.

**P3-8 Income Statement Calculations** The Ferdon Company uses a periodic inventory system. The following is partial information from its income statements for 2007 and 2008:

	2007	2008
Beginning inventory	\$ (2)	\$ (4)
Sales	220,000	(6)
Purchases	118,000	140,000
Purchases returns	2,000	3,000
Ending inventory	48,000	74,000
Sales returns	1,000	3,000
Gross profit	(1)	77,000
Cost of goods sold	106,000	(5)
Expenses	65,000	62,000
Net income	(3)	15,000

**Required**

Fill in the blanks numbered 1 through 6. (*Hint:* It probably is easiest to work through the blanks according to the sequential numbers.)

**P3-9 Effects of Errors** During the current accounting period Page Company makes the following errors. The company uses a perpetual inventory system.

Error	Net Income	Total Assets	Total Liabilities	Total Stockholders' Equity
<i>Example:</i> Failed to record a cash sale.	U	U	N	U
1. The purchase of equipment for cash is recorded as a debit to Equipment and a credit to Accounts Payable.				
2. Failed to record the purchase of inventory on credit.				
3. Cash received from a customer in payment of its account is recorded as if the receipt were for a current period sale.				
4. Failed to record a credit sale.				
5. At the end of the year the receipt of money from a 60-day, 12% bank loan is recorded as a debit to Cash and a credit to Sales Revenue.				
6. Failed to record depreciation at the end of the current period.				

**Required**

Indicate the effect of the errors on the net income, total assets, total liabilities, and total stockholders' equity at the end of the accounting period by using the following code: O = overstated, U = understated, N = no effect. Disregard income taxes.

**P3-10 Errors in Financial Statements** At the end of the current year, the controller of the Jodi Corporation discovers the following items of information:

- Salaries are paid every Friday for a five-day work week. The normal weekly payroll is \$40,000. The year-end falls on a Tuesday this year.
- The company has a \$20,000, nine-month, 12% (annual rate) note payable outstanding at the end of the year. The note was issued on October 1; the interest is to be paid when the note is paid.
- Examining the Rent Expense account, the controller finds that it includes a \$4,800 advance payment for three months' rent. The payment was made on November 1.
- There are \$500 of office supplies left in the storeroom. At the beginning of the year there were no office supplies. During a year the company purchased \$3,500 of office supplies, which were debited to the Office Supplies account.
- The company received a large order in May with a \$13,000 advance payment. The advance payment was credited to Unearned Revenue. In November, the last of the order was received by the customer.

**Required**

For each of the preceding items, indicate the effect on net income, assets, liabilities, and stockholders' equity in the financial statements of the company for the year if the controller fails to make an adjusting entry for the item (ignore income taxes). (*Contributed by Paula L. Koch*)

**P3-11 Worksheet** The Fiorillo Company has the following account balances on December 31, 2007 prior to any adjustments:

	Debit	Credit		Debit	Credit
Cash	\$ 1,900		Accumulated depreciation:		
Accounts receivable	4,700		equipment		3,100
Allowance for doubtful accounts		\$ 60	Accounts payable		4,300
Inventory	8,700		Notes payable (due March 1, 2008)		1,400
Prepaid insurance	600		Unearned rent		1,200
Land	4,100		Mortgage payable (due		
Buildings	38,000		January 1, 2012)		7,300
Accumulated depreciation:			Capital stock (2,000 shares)		10,000
buildings		11,500	Retained earnings (January 1, 2007)		18,075
Equipment	10,700		Dividends distributed	1,300	

(continued)

	Debit	Credit		Debit	Credit
Sales revenue		49,355	Utilities expense	2,000	
Cost of goods sold	27,185		Office supplies expense	770	
Salaries expense	4,080		Delivery expense	1,275	
			Other expenses	980	

*Additional adjustment information:* (a) depreciation on buildings, \$1,100; on equipment, \$600, (b) bad debts expense, \$240, (c) interest accumulated but not paid: on note payable, \$50; on mortgage payable, \$530 (this interest is due during the next accounting period), (d) insurance expired, \$175, (e) salaries accrued but not paid \$370, (f) rent that was collected in advance and is now earned at year-end, \$800, (g) office supplies on hand at year-end, \$230 (expensed when originally purchased earlier in the year), and (h) the income tax rate is 30% on current income and is payable in the first quarter of 2008.

### Required

1. Transfer the account balances to a 10-column worksheet and prepare a trial balance.
2. Complete the worksheet.
3. Prepare the company's income statement, retained earnings statement, and balance sheet.
4. Prepare (a) adjusting, and (b) closing entries in the general journal.

**P3-12 Worksheet** The Langer Company has prepared the following partially completed worksheet for the year ended December 31, 2007:

	A	B	C	D	E	F	G	H	I	J	K
1											
2						Income		Retained		Balance	
3		Trial Balance		Adjustments		Statement		Statement		Sheet	
4	Accounts	Debit	Credit	Debit	Credit	Debit	Credit	Debit	Credit	Debit	Credit
5	Cash	1,000									
6	Accounts receivable	2,700									
7	Allowance for doubtful accounts		30								
8	Note receivable (due 5/1/08)	1,200									
9	Inventory	9,200									
10	Land	4,500									
11	Buildings and equipment	20,600									
12	Accumulated depreciation		8,790								
13	Accounts payable		4,050								
14	Notes payable (due 4/1/2010)		4,000								
15	Capital stock (2,000 shares)		5,000								
16	Retained earnings (1/1/07)		6,120								
17	Dividends distributed	600									
18	Sales revenue		25,140								
19	Rent revenue		550								
20	Cost of goods sold	9,050									
21	Salaries expense	2,750									
22	Delivery expense	720									
23	Heat and light expense	820									
24	Other expenses	540									
25	Totals	53,680	53,680								
26											

*The following additional information is available:* (a) salaries accrued but unpaid total \$250; (b) the \$80 heat and light bill for December has not been recorded or paid; (c) depreciation expense totals \$810 on the buildings and equipment; (d) interest accrued on the note payable totals \$380 (this will be paid when the note is repaid); (e) the company leases a portion of its floor space to Brix Specialty Company for \$50 per month, and Brix has not yet paid its December rent; (f) interest accrued on the note receivable totals \$80; (g) bad debts expense is \$70; and (h) the income tax rate is 30% on current income and is payable in the first quarter of 2008.

### Required

1. Complete the worksheet. (Round to the nearest dollar.)
2. Prepare the company's financial statements.
3. Prepare (a) adjusting, and (b) closing entries in the general journal.

**P3-13 Reversing Entries** During 2007, the Garson Company entered into two transactions involving promissory notes and properly recorded each transaction. These are listed next:

1. On November 1, 2007 it purchased land at a cost of \$8,000. It made a \$2,000 down payment and signed a note payable agreeing to pay the \$6,000 balance in 6 months plus interest at an *annual* rate of 10%.

2. On December 1, 2007 it accepted a \$4,200, three-month, 12% (*annual* interest rate) note receivable from a customer for the sale of merchandise. On December 31, 2007, the Garson Company made the following related adjustments:

Interest Expense	100	
Interest Payable		100
Interest Receivable	42	
Interest Revenue		42

**Required**

- Assuming that the Garson Company uses reversing entries, prepare journal entries to record:
  - The January 1, 2008 reversing entries
  - The March 1, 2008 \$4,326 collection of the note receivable
  - The May 1, 2008 \$6,300 payment of the note payable
- Assuming instead that the Garson Company does *not* use reversing entries, prepare journal entries to record the collection of the note receivable and the payment of the note payable.

**P3-14 Reversing Entries** On December 31, 2007 Cochran Company made the following proper year-end adjusting entries:

Date	Account Titles	Debit	Credit
Dec. 31	Bad Debts Expense	530	
	Allowance for Doubtful Accounts		530
31	Salaries Expense	940	
	Salaries Payable		940
31	Unearned Rent	1,230	
	Rent Revenue		1,230
31	Interest Expense	220	
	Interest Payable (due July 1, 2008)		220
31	Rent Receivable	310	
	Rent Revenue		310
31	Depreciation Expense	5,100	
	Accumulated Depreciation		5,100
31	Insurance Expense	312	
	Prepaid Insurance		312
31	Interest Receivable (due February 1, 2009)	225	
	Interest Revenue		225
31	Office Supplies	100	
	Office Supplies Expense		100
31	Advances to Salespersons	300	
	Salaries Expense		300
31	Income Tax Expense	4,300	
	Income Taxes Payable		4,300

**Required**

- Prepare journal entries to record whatever reversing entries you think are appropriate.
- Explain your reasoning for each reversing entry.

**P3-15 Comprehensive** On November 30, 2007 the Zu Company had the following account balances:

	Debit	Credit		Debit	Credit
Cash	\$ 3,090		Capital stock, no-par (2,000 shares)		\$20,000
Accounts receivable	9,900		Retained earnings (1/1/2007)		42,400
Allowance for doubtful accounts		\$ 100	Dividends distributed	\$ 2,000	
Inventory	17,750		Sales revenue		76,000
Supplies	1,400		Sales returns	6,300	
Land	9,000		Cost of goods sold	36,860	
Buildings and equipment	42,000		Salaries expense	12,500	
Accumulated depreciation		4,200	Advertising expense	8,100	
Accounts payable		10,700	Other expenses	4,500	

During the month of December the Zu Company entered into the following transactions:

Date	Transaction
Dec. 4	Made cash sales of \$3,000; the cost of the inventory sold was \$1,800.
7	Purchased \$2,400 of inventory on credit.
11	Customer returned \$600 (retail price) of inventory for credit to its account; the cost of the inventory returned was \$360.
14	Collected \$900 of accounts receivable.
18	Sold land for \$7,800; the land originally had cost \$5,000.
20	Made credit sales of \$4,000; the cost of the inventory sold was \$2,400.
21	Returned \$360 of defective inventory to supplier for credit to the Zu Company's account and reduced the inventory account.
27	Purchased \$1,250 of inventory for cash.
28	Paid \$1,100 of accounts payable.
31	Purchased land at a cost of \$6,000; made a \$1,000 down payment and signed a 12%, two-year note for the balance.

### Required

- Prepare general journal entries to record the preceding transactions.
- Post to the general ledger accounts.
- Prepare a year-end trial balance on a worksheet and complete the worksheet using the following information: (a) accrued salaries at year-end total \$1,200; (b) for simplicity, the building and equipment are being depreciated using the straight-line method over an estimated life of 20 years with no residual value; (c) supplies on hand at the end of the year total \$630; (d) bad debts expense for the year totals \$830; and (e) the income tax rate is 30%; income taxes are payable in the first quarter of 2008.
- Prepare the company's financial statements for 2007.
- Prepare the 2007 (a) adjusting and (b) closing entries in the general journal.

**P3-16 Comprehensive (Appendix)** Tina Tunxis is the owner of Valley Sales, a distributor of horticulture supplies. The following is the balance sheet of the company as of December 31, 2006:

Cash	\$ 2,300	Accounts payable	\$ 6,400
Accounts receivable	10,400	Salaries payable	1,200
Inventory	12,500		
Equipment	8,000		
Less: Accumulated depreciation	<u>(6,500)</u>	T. Tunxis, Capital	<u>\$19,100</u>
	<u>\$26,700</u>		<u>\$26,700</u>

Tina keeps very few records and has asked you to help her in the preparation of Valley Sales' 2007 financial statements. An analysis of the 2007 cash transactions recorded in the company's checkbook indicates deposits and checks as follows:

Total deposits: \$173,200; all were collections from customers except for a long-term \$10,000 bank loan.

Checks written: \$169,800 summarized as follows:

Inventory	\$123,100	Note payments (including interest of \$650)	\$ 2,650
Salaries	4,250	Office expense	3,400
Rent	4,800	Auto expense	4,100
Equipment	4,000	Withdrawals	23,500

Other information about the company is as follows:

- Accounts receivable at December 31, 2007, \$9,200.
- Accounts payable at December 31:
 

2006: Inventory	\$6,100	2007: Inventory	\$8,500
Office expense	<u>300</u>	Auto expense	<u>200</u>
	<u>\$6,400</u>		<u>\$8,700</u>
- Salaries payable at December 31, 2007, \$1,800.
- Equipment is depreciated by the straight-line method over a 10-year life. The equipment purchased in 2007 was acquired on July 1.
- Interest payable at December 31, 2007, \$140.
- The company uses a periodic inventory system. Inventory at December 31, 2007, \$17,400.

**Required**

1. Prepare a worksheet to summarize the transactions and adjustments of Valley Sales for 2007. (*Hint: Include debit and credit columns for both transactions and adjustments.*)
2. Prepare a 2007 income statement and a balance sheet as of December 31, 2007. (*Contributed by Walter A. Parker*)

**P3-17 AICPA Adapted Comprehensive (Appendix)** Presented next is information pertaining to Ward Specialty Foods, a calendar-year sole proprietorship, maintaining its books on the cash basis during the year. At year-end, however, Mary Ward's accountant adjusts the books to the accrual basis only for sales, purchases, and cost of sales, and records depreciation to more clearly reflect the business income.

**Trial Balance  
December 31, 2007**

	Debit	Credit
Cash	\$ 18,500	
Accounts receivable, 12/31/06	4,500	
Inventory, 12/31/06	20,000	
Equipment	35,000	
Accumulated depreciation, 12/31/06		\$ 9,000
Accounts payable, 12/31/06		4,800
Payroll taxes withheld		850
Mary Ward, withdrawals	24,000	
Mary Ward, capital, 12/31/06		33,650
Sales		187,000
Purchases	82,700	
Salaries	29,500	
Payroll taxes	2,900	
Rent	8,400	
Miscellaneous expense	3,900	
Insurance	2,400	
Utilities	3,500	
	\$235,300	\$235,300

During 2007, Ward signed a new eight-year lease for the store premises and is in the process of negotiating a loan for remodeling purposes. The bank requires Ward to present financial statements for 2007 prepared on the accrual basis. To do so, Ward's accountant obtained the following additional information:

1. Amounts due from customers totaled \$7,900 at December 31, 2007.
2. A review of the receivables at December 31, 2007 disclosed that an allowance for doubtful accounts of \$1,100 should be provided. Ward had no bad debt losses from the inception of the business through December 31, 2007.
3. The inventory amounted to \$23,000 at December 31, 2007 based on a physical count of goods priced at cost. No reduction to market was required.
4. On signing the new lease on October 1, 2007, Ward paid \$8,400 representing one year's rent in advance for the lease year ending October 1, 2008. The \$7,500 annual rental under the old lease was paid on October 1, 2006 for the lease year ended October 1, 2007.
5. On April 1, 2007, Ward paid \$2,400 to renew the comprehensive insurance coverage for one year. The premium was \$2,160 on the old policy, which expired on April 1, 2007.
6. Depreciation on the equipment was computed at \$5,800 for 2007.
7. Unpaid vendors' invoices for food purchases totaled \$8,800 at December 31, 2007.
8. Accrued expenses at December 31, 2006 and December 31, 2007 were as follows:

	12/31/06	12/31/07
Payroll taxes	\$250	\$400
Salaries	375	510
Utilities	275	450

After obtaining the preceding information, Ward's accountant prepared the following partially completed worksheet:

1	A	B	C	D	E	F	G
2	Accounts	Cash Basis		Adjustments		Accrual Basis	
3		Debit	Credit	Debit	Credit	Debit	Credit
3	Cash	\$18,500					
4	Accounts receivable	4,500					
5	Allowance for doubtful accounts						
6	Inventory	20,000					
7	Equipment	35,000					
8	Accumulated depreciation		\$9,000				
9	Prepaid rent						
10	Prepaid insurance						
11	Accounts payable		4,800				
12	Accrued expenses						
13	Payroll taxes withheld		850				
14	Ward, withdrawals	24,000					
15	Ward, capital		33,650				
16							
17	Sales		187,000				
18	Purchases	82,700					
19	Income summary - inventory						
20	Salaries	29,500					
21	Payroll taxes	2,900					
22	Rent	8,400					
23	Miscellaneous expenses	3,900					
24	Insurance	2,400					
25	Utilities	3,500					
26	Depreciation						
27	Bad debts						
28	Totals	\$235,300	\$235,300				
29							

#### Required

1. Complete the preceding worksheet to convert the trial balance of Ward Specialty Foods to the accrual basis for the year ended December 31, 2007.
2. Prepare the statement of changes in Mary Ward, Capital, for the year ended December 31, 2007.

## 4

## OBJECTIVES

After reading this chapter, you will be able to:

- 1 Understand the purposes of the balance sheet.
- 2 Define the elements of a balance sheet.
- 3 Explain how to measure the elements of a balance sheet.
- 4 Classify the assets of a balance sheet.
- 5 Classify the liabilities of a balance sheet.
- 6 Report the stockholders' equity of a balance sheet.
- 7 Prepare a statement of changes in stockholders' equity.
- 8 Understand the other disclosure issues for a balance sheet.
- 9 Describe the SEC integrated disclosures.
- 10 Explain the reporting techniques used in an annual report.

## The Balance Sheet and the Statement of Changes in Stockholders' Equity

### Do You Believe in Magic?

**Walt Disney Company** is well known for the magic that its “imagineers” have created in movie theaters and theme parks across the globe. To those not well versed in accounting, it appears that financial analysts may possess similar mystical qualities as they value a company’s securities. Using several key financial variables (fundamentals) as their crystal ball, financial analysts will often make predictions of a company’s future performance. For example, accounts receivable or inventory increases that are disproportionate to sales increases are often perceived as signals that a company is having trouble generating sales and that near-term economic prospects may be gloomy.

However, before you begin analyzing balance sheet information, you should be aware that the balance sheet has some significant limitations, or you could get the mistaken impression that a company’s accountants possess as much financial magic as Disney’s imagineers. For example, at the end of Disney’s 2004 fiscal year, its market value of stockholders’ equity (number of shares outstanding multiplied by stock price) was approximately \$44 billion while the book value (reported amount) of this equity on its balance sheet was approximately \$26 billion. What causes these differences between the market value of a company’s stockholders’ equity and its book value? Is it financial magic? Is it due to the mispricing in the stock market or in the way that accountants calculate book values? The explanations are varied and include the use of historical costs for valuing assets and liabilities, the use of estimates, and the existence of “off-balance sheet” assets and liabilities.

Credit: KIN CHEUNG/Reuters/Landov

Let's examine the sources of these differences in a little more detail. Disney's book value is based on past transactions measured at historical costs, yet its market value is based on market estimates of Disney's future prospects. For example, in the 1960s, Walt Disney was able to acquire about 43 acres (about twice the size of Manhattan Island) for a little over \$5 million to build the Disney World Resort area. The market value of that land is certainly much more than that today, yet the increased value does not appear on Disney's balance sheet.

Second, Disney makes many estimates of balance sheet items including accounts receivable, property, plant, and equipment, and contingent liabilities. These estimates are disclosed in the notes to the financial statements and should be considered in any financial analysis. Finally, many assets and liabilities are not recorded at all. The intellectual capital of Disney's imagineers is not shown as an asset on the balance sheet. Additionally, Disney reported contractual obligations of over \$34 billion; however \$20 billion of these obligations do not appear on the balance sheet.

With a clear understanding of the balance sheet and its limitations, we can see that the balance sheet isn't the result of magic but simply the result of current accounting rules and practices.

### FOR FURTHER INVESTIGATION

For an article discussing a current balance sheet limitation of interest to accounting professionals (off-balance sheet structures), consult the Business & Company Resource Center (BCRC):

- All in the family: FIN 46 made companies admit paternity of special purpose entities. But it also resulted in some surprise adoptions. Tim Reason, *CFO, The Magazine for Senior Financial Executives*, 8756-7113, September 2004, v20, i11, p99(2).

**FASB Statement of Concepts No. 5** recommends that a full set of financial statements for an accounting period should show a company's

- financial position at the end of the period,
- net income for the period,
- comprehensive income for the period,
- cash flows for the period, and
- investments by and distributions to owners for the period.<sup>1</sup>

Currently, companies include at least three major financial statements and several supporting schedules as the “full set” of financial statements in their **annual reports**. The three major financial statements are

1. the **balance sheet** or statement of financial position, which shows the company's financial position at the end of the accounting period,
2. the **income statement**, which shows the results of the company's income-producing activities for the accounting period, and
3. the **statement of cash flows**, which shows the cash inflows and cash outflows of the company for the accounting period.

Many companies include a statement of changes in stockholders' equity, which shows the changes in each item of stockholders' equity for the accounting period, as a fourth major financial statement.<sup>2</sup> A company also includes explanatory notes in its annual report to supplement these financial statements.

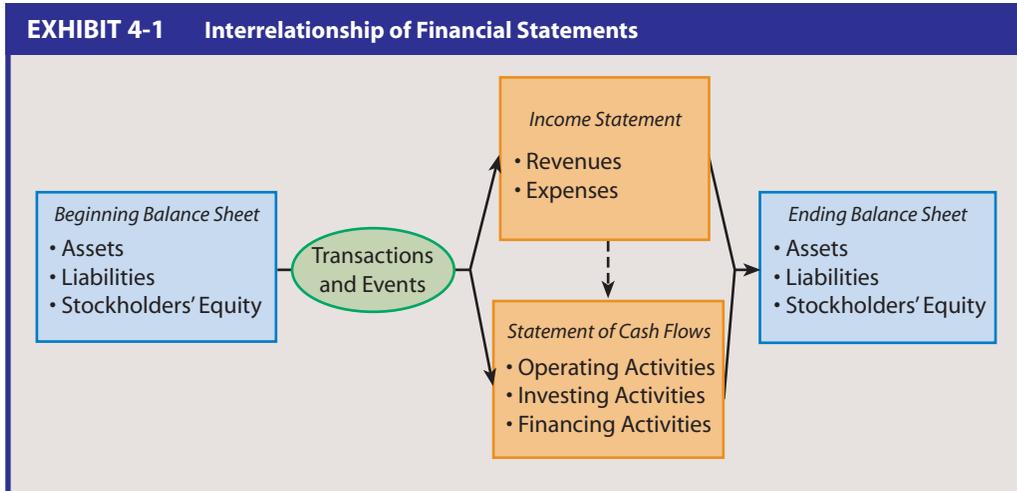

In this chapter, we focus primarily on the balance sheet, the statement of changes in stockholders' equity, and the accompanying notes. We discuss the balance sheet first because the FASB defines revenues and expenses in terms of changes in assets and liabilities. Thus, you need a clear understanding of the nature and measurement of assets and liabilities to understand net income and its components. Furthermore, the chapters of this book in general follow a balance sheet framework. Consequently, you need to know its purpose, content, format, and preparation to understand the more complex issues we discuss later. The statement of changes in stockholders' equity helps to explain the changes that occurred in each stockholders' equity item on a company's balance sheet from the beginning to the end of the accounting period. We also discuss this statement in this chapter as it relates to the balance sheet. The discussion focuses on the corporation, the major business entity in the United States. We discuss the income statement and statement of cash flows in Chapter 5.

## INTERRELATIONSHIP OF FINANCIAL STATEMENTS

Exhibit 4-1 shows the interrelationship of the information in a company's major financial statements. The solid lines indicate the major flows of interrelated financial accounting information among the financial statements because of transactions and events during the period. For instance, the company may use assets from the beginning balance sheet (i.e., the ending balance sheet from the previous period) in an income-producing activity or it may sell them as a source of cash. The related financial accounting information will affect the company's income statement and statement of cash flows, respectively. Both the information about the income-producing activities reported in the income statement and the

1. “Recognition and Measurement in Financial Statements of Business Enterprises,” *FASB Statement of Financial Accounting Concepts No. 5* (Stamford, Conn.: FASB, 1984), par. 13.

2. Some companies include a statement of comprehensive income as another major financial statement. We discuss this statement in Chapter 5.

information about the cash inflows and cash outflows shown in the statement of cash flows will affect the accounting information reported in the ending balance sheet. The dashed line indicates a secondary flow of the interrelated information; that is, the income-producing activities that the company reports on its income statement also provide a net source of cash from operating activities. We further explain the relationships among the balance sheet, income statement, and statement of cash flows in the remaining sections of this chapter and in later chapters of this book.

## PURPOSES OF THE BALANCE SHEET

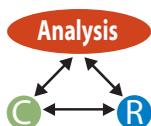

One objective of financial reporting for a company is to help investors, creditors, and others assess the amounts, timing, and uncertainty of the prospective net cash inflows of the company. To meet this objective, the FASB suggested that a company should provide certain types of accounting information in its financial statements. A specific objective of a company's financial statements is to provide information about its economic resources, obligations, and owners' equity. This information is reported on a balance sheet. **A balance sheet shows the *financial position* of a company at a particular date.** A balance sheet also may be called a **statement of financial position**. The financial position of a company includes its economic resources (i.e., assets), economic obligations (i.e., liabilities), and equity, and their relationships to each other at a moment in time. A corporation's balance sheet, then, discloses its assets, liabilities, stockholders' equity, and related information on a specific date. The statement reports the corporation's *resource structure* (i.e., major classes and amounts of assets) and its *financial structure* (i.e., major classes and amounts of liabilities and equity). Its name evolved because the balance sheet is a detailed summary of the basic accounting equation (which must always remain in balance):

$$\text{Assets} = \text{Liabilities} + \text{Stockholders' Equity}$$

The balance sheet does not attempt to show the total fair value of a company. Together with other financial statements and other information, however, it provides information that is useful to external users who want to make their own estimates of the company's fair value. More specifically, a company's balance sheet is intended to help external users (1) assess its liquidity, financial flexibility, and operating capability and (2) evaluate information about its income-producing performance during the period.

1 Understand the purposes of the balance sheet.

## Liquidity, Financial Flexibility, and Operating Capability

Liquidity refers to how quickly a company can convert an asset into cash to pay its bills. That is, liquidity relates to the “nearness to cash” of a company’s economic resources. Information about liquidity is important in evaluating the *timing* of cash flows in the near future. Information about short-term cash inflows is useful because these cash inflows are part of total cash inflows. Also, a company needs short-term cash inflows to take advantage of new investment opportunities as well as to pay its short-term obligations. Liquidity is also one aspect of a company’s financial flexibility.

**Financial flexibility refers to the ability of a company to use its financial resources to adapt to change.** Adaptation may be thought of as being “offensive” or “defensive.” A company uses offensive adaptation to take advantage of an unexpected new business opportunity, while it uses defensive adaptation to react to a negative business event. Financial flexibility may come from a quick access to the cash generated from more “liquid” economic resources. But liquidity is only part of financial flexibility. A company’s financial flexibility comes from its ability to obtain enough net cash inflows from operations, from additional capital contributed by investors or long-term creditors, or from liquidating long-term economic resources without disrupting continuing operations. Information about a company’s financial flexibility is important to external users in assessing the uncertainty of its future cash flows.

**Operating capability refers to the ability of a company to maintain a given physical level of operations.** This level may be indicated by the quantity of goods or services the company produced in a given period (i.e., inventory) or by the physical capacity of its operating assets (i.e., property, plant, and equipment) used to produce the goods or services. Information about a company’s operating capability may be helpful to external users in understanding its performance and predicting future changes in its volume of activity and related cash flows.<sup>3</sup>

## Capital and Capital Maintenance

A company’s balance sheet provides a basis for evaluating its income-producing performance during a period. Therefore, a company’s capital is important. **The capital (or net assets) of a company is its economic resources (assets) less its economic obligations (liabilities), or owners’ equity.** For a corporation, the stockholders’ equity is the capital. The management of the corporation uses this capital in fulfilling its responsibilities to the corporate stockholders. When a stockholder invests in a corporation, the stockholder is interested in a return *of* investment as well as a return *on* investment. To provide for a return of investment, the corporation’s stockholders’ equity (capital) must be maintained; this is referred to as **capital maintenance**. Once this capital is maintained, any income of the corporation is an increase in stockholders’ equity. This increase is the basis for providing a return *on* investment to stockholders. Dividends are a return on investment, as is market price appreciation on the stock. Many investors prefer market price appreciation to dividends. Information about a corporation’s capital is important in assessing its profitability and its ability to provide a return on investment. We discuss capital maintenance and income in Chapter 5.

Another way for you to look at Exhibit 4-1 is to think in terms of capital and capital maintenance. You can think of the beginning balance sheet as showing the corporation’s capital at the beginning of the accounting period. The income statement and the statement of cash flows disclose the results of management’s activities to use, maintain, and increase the capital during the accounting period. The ending balance sheet reports the capital at the end of the accounting period. But before it can be determined whether

3. *Ibid.*, par. 24, 26, and 27 and “Reporting Income, Cash Flows, and Financial Position of Business Enterprises,” *FASB Proposed Statement of Financial Accounting Concepts* (Stamford, Conn.: FASB, 1981), par. 25-32.

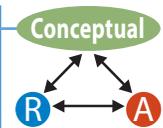

capital is maintained or a corporation has earned income, the initial (beginning) and subsequent (ending) capital must be determined.

Capital can be thought of in terms of (1) financial capital or (2) physical capital. **Financial capital is the monetary value of the net assets** from investments by stockholders as well as from earnings retained by the corporation. **Physical capital is a quantitative measure of the physical productive capacity** (e.g., square feet of factory space) of the corporation to provide goods or services. It is related to the concept of operating capability that we discussed in the previous section.<sup>4</sup> The difference between financial capital and physical capital is important in considering whether and when capital is maintained and income is earned (Chapter 5). The difference is not as important for reporting the capital at a point in time because accounting information primarily is expressed in dollars. Thus, a dollar value must be assigned to the physical capital before it is reported on a balance sheet. We discuss the alternative ways of measuring the net assets (capital) of a corporation later in the chapter.

## RECOGNITION IN THE BALANCE SHEET

A company may disclose an item of information related to its financial position in its balance sheet, in a supporting schedule, or as part of the notes accompanying the financial statements. Recall from Chapter 2 that **recognition is the process of formally recording and reporting an element in the financial statements**. It includes depiction of an element in both words and numbers, with the amount included in the totals. Generally, the most useful (i.e., the best combination of relevance and reliability) information about assets, liabilities, and equity should be recognized and reported in the main body of the balance sheet. There are four basic recognition criteria. To be recognized, an item (and information about it) must meet the definition of an element, and be measurable, relevant, and reliable.<sup>5</sup> Thus, to meet the objectives of a company's balance sheet—to provide relevant and reliable information to assess its liquidity, financial flexibility, and operating capability and to evaluate its income-producing performance during the period—the company must determine what, how, and where to disclose the “elements” of the balance sheet. That is, the company must complete a three-stage process:

1. Identification of what items meet the definitions of the elements
2. Measurement (valuation) of the elements
3. Reporting (classification) of the elements

## ELEMENTS OF THE BALANCE SHEET

For a company to report an item of information on its balance sheet, the item must meet the definition of an element. **The elements of the balance sheet are the broad classes of items comprising it**. They are the building blocks with which the balance sheet is prepared. The elements of financial statements are defined in **FASB Statement of Concepts No. 6**. We define and discuss each of the elements of a corporate balance sheet—assets, liabilities, and stockholders' equity—in the following sections.<sup>6</sup>

**2** Define the elements of a balance sheet.

4. For a further discussion, see “Conceptual Framework for Financial Accounting and Reporting: Elements of Financial Statements and Their Measurement,” *FASB Discussion Memorandum* (Stamford, Conn.: FASB, 1976), ch. 6.

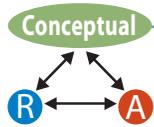

5. “Recognition and Measurement in Financial Statements of Business Enterprises,” *FASB Statement of Financial Accounting Concepts No. 5, op. cit.*, par. 58–64.

6. The discussion of the elements in the following sections is a summary of that presented in “Elements of Financial Statements of Business Enterprises,” *FASB Statement of Financial Accounting Concepts No. 6* (Stamford, Conn.: FASB, 1985).

## Assets

**Assets are the probable future economic benefits obtained or controlled by a company as a result of past transactions or events.**

Assets are the economic resources used to carry out a company's economic activities of consumption, production, and exchange. The primary attribute of all assets is *service potential*, the capacity to provide services or benefits to the company that uses them. To be considered an asset, an economic resource must have three characteristics:

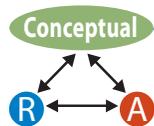

1. The resource must be able to contribute directly or indirectly to the company's future net cash inflows. This service potential may exist because the asset is expected to be exchanged for something else of value to the company (e.g., accounts receivable), to be used in producing goods (e.g., factory) or services, to increase the value of other assets (e.g., patent), or to be used to settle its liabilities (e.g., cash).
2. The company must be able to obtain the future benefit and control others' access to it. Control means that the company can deny or regulate the ability of others to use the asset.
3. The transaction or event giving the company the right to or control over the benefit must have occurred. As a corollary, once an asset is acquired by a company, it continues to be an asset until it is exchanged or used up, or until some other event destroys the future benefit or removes the company's ability to obtain or control it.

Assets may be natural or man-made, tangible or intangible, and either exchangeable or useful only in the company's activities. Furthermore, they may be acquired by purchase, production, stockholder investments, discovery, or other nonreciprocal (one-way) transfers.

## Liabilities

**Liabilities are the probable future sacrifices of economic benefits arising from present obligations of a company to transfer assets or provide services in the future as a result of past transactions or events.**

An obligation of a company must have three characteristics to be considered a liability:

1. It must involve a responsibility that will be settled by a sacrifice involving the transfer of assets, provision of services, or other use of assets at a specified or determinable date, on occurrence of a specified event, or on demand. The company does not need to know the specific identity of the "creditor" for a liability to exist, as long as a future transfer or use of assets to settle the liability is *probable*.
2. The responsibility must obligate the company so that it has little or no discretion to avoid the future sacrifice. Although most liabilities involve legal rights and duties, some are the result of equitable (ethical or moral) obligations or constructive (inferred from the facts) obligations. Thus, the company must be bound by a legal, equitable, or constructive responsibility to transfer assets or provide services.
3. The transaction or other event obligating the company must have occurred. Once a liability has been incurred, it continues to be a liability until the company settles it or another event removes it from the company's responsibility.

Liabilities arise primarily from purchasing goods or services on credit and from borrowing funds. Other liabilities result from collecting economic resources in advance of providing goods or services to customers. Liabilities also arise from selling products subject to warranties, from regulations imposed by governmental units, and from nonreciprocal transfers to owners or other entities.

## Stockholders' Equity

**Equity is the residual interest in the assets of a company that remains after deducting its liabilities.**

The equity of a company is equal to its net assets (assets minus liabilities). Equity stems from ownership rights, and therefore it is the ownership interest. Since a company generally is not obligated to transfer assets to its owners, owners' equity ranks after liabilities as an interest in the assets and thus is a residual interest. For a corporation, stockholders' equity represents the interest of the stockholders, who bear the risks involved in the company's operations and activities and who obtain the resulting rewards. It is created by stockholders' investments of economic resources and later is modified by additional investments, net income, distributions to owners, and other changes in assets and liabilities. Stockholders' equity may not exist apart from the corporate assets and liabilities, since it is a residual interest.

## MEASUREMENT OF THE ELEMENTS OF THE BALANCE SHEET

For a company to report an element on its balance sheet, the element must be reliably measured (valued) in monetary terms. The FASB has identified five alternatives for measuring elements. We show these alternative valuation methods in Exhibit 4-2 and discuss them in the following sections. Later in the chapter, when we discuss specific assets and liabilities, we identify the applicable valuation method. We do not include stockholders' equity in Exhibit 4-2 because it may not exist apart from assets or liabilities. That is, the measurement of assets and liabilities (i.e., net assets) will determine the dollar amount of stockholders' equity. To conserve space, we focus the discussion on the measurement of assets, but our comments generally also apply to liabilities.

**3** Explain how to measure the elements of a balance sheet.

### Historical Cost

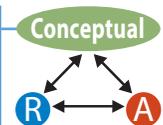

**The historical cost of an asset is the exchange price in the transaction in which the asset was acquired.** The historical cost is measured by the cash paid for the asset or, in the case of a noncash exchange, by the estimated cash equivalent of the non-cash asset or liability exchanged. After acquisition, the historical cost of an asset may be reduced due to the recognition of depreciation, amortization, impairment, or other adjustments.

### Current Cost

**The current cost of an asset is the amount of cash (or equivalent) that would be required on the date of the balance sheet to obtain the same asset.** The "same asset" may be an identical asset or one with equivalent productive capacity. Alternative methods for obtaining the current cost include quoted market prices, the use of specific price indexes, and appraisals. Current cost is an *input value* and is sometimes referred to as *current replacement cost*.

### Current Market Value

**The current market value of an asset is the amount of cash (or equivalent) that could be obtained on the date of the balance sheet by selling the asset, in its present condition, in an orderly liquidation.** An orderly liquidation means the asset is disposed of in a

**EXHIBIT 4-2 Measurement (Valuation) of Assets and Liabilities**

<b>Alternative</b>	<b>Assets</b>	<b>Liabilities</b>
1. Historical cost/historical proceeds	Initially, the amount of cash (or its equivalent) paid to acquire an asset (historical cost); subsequent to acquisition, the historical amount may be adjusted for depreciation, amortization, or other adjustments.	Initially, the amount of cash (or its equivalent) received when an obligation was incurred (historical proceeds); subsequent to incurrence, the historical amount may be adjusted for amortization.
2. Current cost/current proceeds	Amount of cash (or its equivalent) that would have to be paid if the same asset were acquired currently.	Amount of cash (or its equivalent) that would be obtained if the same obligation were incurred currently.
3. Current market value	Amount of cash (or its equivalent) that could be obtained currently by selling the asset in orderly liquidation.	Amount of cash (or its equivalent) that would be required currently to eliminate the liability.
4. Net realizable value	Amount of cash (or its equivalent) into which the asset is expected to be converted in due course of business less direct costs necessary to make that conversion.	Amount of cash (or its equivalent) expected to be paid to eliminate the liability in due course of business.
5. Present value	Present value of future cash inflows into which the asset is expected to be converted in due course of business less present value of future cash outflows necessary to obtain those inflows.	Present value of future cash outflows to eliminate the liability in due course of business.

Source: Adapted from "Conceptual Framework for Financial Accounting and Reporting: Elements of Financial Statements and Their Measurement," *FASB Discussion Memorandum* (Stamford, Conn.: FASB, 1976), p. 193 and "Recognition and Measurement in Financial Statements of Business Enterprises," *FASB Statement of Financial Accounting Concepts No. 5* (Stamford, Conn.: FASB, 1984), p. 23.

systematic and organized fashion. A current market value would be determined by obtaining a quoted market price for the sale of an asset of similar kind and condition. The term current market value is potentially confusing, because current cost and current market value are both "market values." Therefore, sometimes current market value is referred to as *current exit value*.

### Net Realizable Value

The net realizable value of an asset is the amount of cash (or equivalent) into which the asset is expected to be converted in the ordinary operations of the company, less any expected conversion costs (e.g., completion, disposal, or collection costs). Net realizable value differs from current exit value by being based upon expected *future* sales proceeds of the asset (perhaps in a different form) rather than upon the *current* disposal value of an asset in its existing form. Net realizable value is sometimes referred to as *expected exit value*.

## Present Value

The present value of an asset is the net amount of discounted future cash inflows less the discounted future cash outflows relating to the asset. Each future cash flow may be a single amount; in this case, the amount is referred to as an *estimated* cash flow. Or, each future cash flow may involve a range of possible amounts. In this case, a “weighted average” amount is determined and is referred to as an *expected* cash flow. When the estimated cash flows are used to determine present value, they are similar to those used to determine net realizable value; the difference between the two alternatives is that under the present value approach the time value of money (i.e., interest) is considered.<sup>7</sup> We discuss discounting and the computation of present value in the Time Value of Money module.

## Valuations on Today's Balance Sheet

The valuation method primarily used in a company's balance sheet is historical cost. In general, each asset and liability of the company is recorded at the exchange price of the transaction in which the asset is obtained or the liability is incurred. Usually the company then reports this exchange price in its balance sheet until another exchange has taken place. Certain assets such as property, plant, and equipment are measured and reported at their exchange price (historical cost) adjusted for depreciation. Historical cost is used extensively as a valuation method because it is based on transactions and provides information that has a high degree of *reliability*. It has been criticized, however, because some users of financial statements argue that historical cost is not as *relevant* as the amounts reported under some alternative valuation methods. That is, historical cost may not represent the amount of future cash inflows (or outflows) that the company is likely to obtain (or pay) for the asset (or liability).

The FASB sometimes requires a company to report an asset or liability at its fair value. To clarify how to measure fair value, the FASB has issued a **Proposed FASB Statement of Standards**. This *Proposed Statement* defines **fair value** as the estimated price at which an asset (or liability) could be exchanged in a current transaction between knowledgeable, unrelated willing parties under normal business conditions. It indicates that the objective of determining a fair value is to estimate an exchange price for an asset (or liability) when an actual transaction has not occurred.

The *Proposed Statement* defines “market inputs” as the assumptions and data that would be used to estimate fair value. It groups these market inputs into a “hierarchy” of five broad categories (levels) for estimating fair value, as follows:

- *Level 1* market inputs are the best information for estimating fair value. These inputs are quoted prices in active markets for identical assets.
- *Level 2* market inputs are quoted market prices for similar assets, adjusted for differences between the assets.
- *Level 3* market inputs are direct market values other than quoted prices (e.g., current appraisals).
- *Level 4* market inputs are indirect market values (e.g., previous appraisals).
- *Level 5* measures are the lowest level of information and are “entity” inputs. These are based on the application of valuation techniques. Whenever possible (without undue cost and effort), multiple valuation techniques consistent with the market approach, income approach, and cost approach should be used. The *market*

7. FASB *Statement of Financial Accounting Concepts No. 5*, *op. cit.*, par. 67, and “Conceptual Framework for Financial Accounting and Reporting: Elements of Financial Statements and Their Measurement,” FASB *Discussion Memorandum*, *op. cit.*, pp. 196–206, and “Using Cash Flow Information and Present Value in Accounting Measurements,” FASB *Statement of Financial Accounting Concepts No. 7* (Norwalk, Conn.: FASB, 2000) p. 1.

*approach* requires observable prices based on actual transactions involving comparable assets. The *income approach* uses present value techniques to convert future amounts to a single present amount. The *cost approach* relates to the amount that would have to be paid to replace an asset's service capacity.

When measuring the fair value, a company must consider whether the asset will continue to be used in the business or will be sold. A company must also disclose certain information about its use of fair value to remeasure assets (and liabilities) reported on its balance sheet. This includes, for instance, how the fair value amount(s) were determined and the impact on the company's earnings for the period.<sup>8</sup>

Depending on the circumstances, to report the fair value of an asset or liability, a company might use current cost, current exit value, net realizable value, or present value. For instance, a company uses current cost for valuing certain "inventories," current exit value for "marketable securities," net realizable value for "receivables," and present value for "bonds payable." We identify the valuation method used for each type of asset and liability in the next section and we discuss these methods more fully in later chapters. As increased emphasis is placed on reporting information concerning a company's liquidity, financial flexibility, and operating capability, it is likely that the FASB will require more fair values to be reported on balance sheets (or related notes). The extent of the use of other valuation methods will depend, among other considerations, on the tradeoff between relevance and reliability. It is possible the FASB may develop GAAP in which "financial" assets and liabilities are valued at fair value while "non-financial" assets and liabilities are valued at historical cost.

## LINK TO ETHICAL DILEMMA

As the controller for a struggling manufacturing company, you are in the process of closing the books for the year and notice that the company is going to be in technical violation of its debt covenants. Such a violation could result in bankruptcy, which would result in the loss of hundreds of jobs, including your own. You quickly analyze the financial statements and realize that by changing a few estimates involving accounts receivable, warranties, and pensions, the company will be able to avoid a violation of its debt covenants. While you don't believe the revised estimates would best represent the economic reality of your company's financial position, you also don't believe the estimates are unreasonably aggressive. Do you revise the estimates?

## Limitations of the Balance Sheet

In addition to the criticism that the use of historical costs for valuing assets and liabilities does not help users assess the likely amounts of future cash flows relating to these items, there are other limitations of the balance sheet. First, a company's balance sheet does not include all of its economic resources and economic obligations. For instance, "human resources" or "intellectual capital" such as high-quality management or highly creative employees are not included as assets, primarily because of the difficulty of reliably measuring their values. Or, possible legal obligations for air or water pollution may not be reported as liabilities, again due to measurement problems. Second, many of the

8. "Fair Value Measurements," *FASB Proposed Statement of Financial Accounting Standards* (Norwalk, Conn.: FASB, 2004).

amounts that a company reports are based on estimates, which are subject to change. As we discuss in the next section, estimates are involved in determining the amounts for items such as uncollectible accounts and depreciation, as well as warranty and pension liabilities. Finally, in periods of inflation the amounts listed on a company's balance sheet do not show the "purchasing power" of its assets and liabilities. The FASB is aware of these limitations and in certain instances, as we discuss later in the chapter, requires companies to disclose additional information in the notes to the financial statements to help users in their decision making.

### SECURE YOUR KNOWLEDGE 4-1

- By providing information about a company's resources and financial structure, the balance sheet should help users:
  - assess a company's liquidity, financial flexibility, and operating capability, and
  - evaluate a company's income-producing performance during a period.
- The elements of a balance sheet that should be recognized are assets, liabilities, and stockholders' equity.
- Various valuation methods can be used to measure elements on a balance sheet, with historical cost being the primary method employed; however, increasing use of fair value measurements is being required by FASB.
- The balance sheet does suffer from several limitations, including the use of historical cost, the exclusion of some economic resources and obligations, the use of estimates, and the lack of purchasing power adjustments.

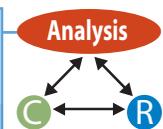

## REPORTING CLASSIFICATIONS ON THE BALANCE SHEET

A company's accounting system processes vast amounts of data. When the company prepares the financial statements, it simplifies, condenses, and classifies that data. The classifications are designed to help analysis by grouping items with similar characteristics. The intent is to improve the predictive value, and hence the usefulness, of the financial information for assessing the amounts, timing, and uncertainty of future cash flows.<sup>9</sup> **The arrangement of each company's balance sheet items and subtotals should be designed to be useful to its various external user groups.** But there are differences in companies, industries, and economic conditions. Therefore, there must be flexibility in classifications to ensure that a company's balance sheet is useful. Nonetheless, a general classification scheme may be presented that captures the majority of items reported by most companies.

A corporation usually divides its balance sheet into three sections, and groups the items reported within each section in some informative manner. A common classification would be:

1. *Assets*
  - a. Current assets
  - b. Long-term investments
  - c. Property, plant, and equipment
  - d. Intangible assets
  - e. Other assets
2. *Liabilities*
  - a. Current liabilities
  - b. Long-term liabilities
  - c. Other liabilities

4 Classify the assets of a balance sheet.

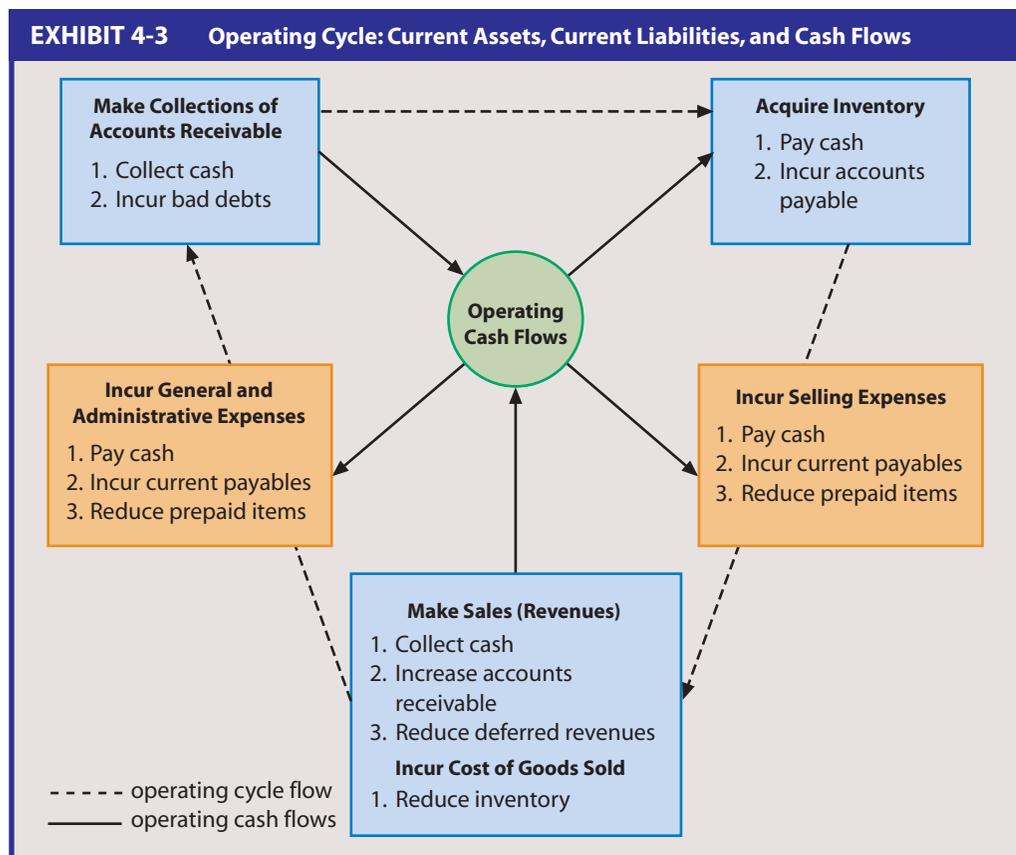

9. *Ibid.*, FASB Statement of Financial Accounting Concepts No. 5, par. 20–22.

3. *Stockholders' equity*
  - a. Contributed capital
    - (1) Capital stock
    - (2) Additional paid-in capital
  - b. Retained earnings
  - c. Accumulated other comprehensive income

We discuss each of these groupings in the following sections. We show a comprehensive illustration of a balance sheet at December 31, 2007 for the Caron Manufacturing Company in Example 4-1 on pages 130 and 131. For selected items, we show illustrations of disclosures of actual companies in related exhibits. Appendix A includes **The Coca-Cola Company's** balance sheet at December 31, 2004.

## Current Assets

**Current assets are cash and other assets that a company expects to convert into cash, sell, or consume within one year or the normal operating cycle, whichever is longer.** An *operating cycle* is the average time taken by a company to spend cash for inventory, process and sell the inventory, and collect the receivables, converting them back into cash. We show an example of a company's operating cycle in Exhibit 4-3. Note the relationship between current assets, current liabilities (discussed in the next section), and operating cash flows. Most companies have operating cycles of a year or less. A few, such as construction, lumber, distillery, and tobacco companies, have operating cycles that are longer than

one year. In that case, the longer time period should be used to determine the current assets.<sup>10</sup>

A company's current assets may include five items:

- cash (and cash equivalents),
- temporary investments in marketable securities,
- receivables,
- inventories, and
- prepaid items.

(Companies may use different titles than the ones we use here.) These items usually are presented in the current asset section in the order of their liquidity, as we show in Example 4-1 on pages 130 and 131.

**Cash** includes cash on hand and readily available in checking and savings accounts. Many companies also include "cash equivalents" with cash. *Cash equivalents* are risk-free securities, such as money market funds and treasury bills that will mature in three months or less from the date acquired by the holder. **Temporary investments in marketable securities** include debt and equity securities that are classified as "trading securities," "available-for-sale securities" that management intends to sell within one year or the normal operating cycle (whichever is longer), and "held-to-maturity" securities that will mature within a year. Also included are "derivative financial instruments," such as options to buy stock. Alternative titles include *short-term marketable securities* and *short-term investments*. They are listed at their fair value (current market value). **Receivables** include accounts receivable and notes receivable with short-term maturity dates. They are listed at their estimated collectible amounts (net realizable values).

**Inventories** include goods held for resale in the normal course of business plus, in the case of a manufacturing company, raw materials (items to be converted into finished goods) and work in process (partially completed goods) inventories. They are listed at their historical cost or market value (current cost), whichever is lower. The inventory costing method (LIFO, FIFO, average cost) is disclosed parenthetically or in the related notes. To reduce the detail on its balance sheet, a company might show a total inventory amount in current assets and include a schedule of the components in the notes to the financial statements. This procedure is used by **Johnson & Johnson**, as we show in Real Report 4-1 on page 132. **Prepaid items** such as insurance, rent, office supplies, and taxes will not be converted into cash but will be consumed. Conceptually, prepaid items should not be classified as current assets because they do not directly enter into the operating cycle. However, they are included as current assets because had they not been paid in advance, cash would have been paid out within the cycle. Also, even though a two-year prepayment of insurance would extend over more than an annual operating cycle, the payment is usually classified as a current asset because the amount is not material. Prepaid items are listed at the historical cost of the remaining amounts.

## Current Liabilities

We discuss current liabilities next because of their close relation to current assets. **Current liabilities are obligations of a company that it expects to liquidate by using existing current assets, or creating other current liabilities within one year or the normal operating cycle, whichever is longer.** Several types of liabilities should be included as current liabilities:

1. Obligations for items (goods or services) that are in the operating cycle. These include, for instance, accounts payable and salaries payable.

---

10. "Restatement and Revision of Accounting Research Bulletins," *Accounting Research and Terminology Bulletins, Final Edition, No. 43* (New York: AICPA, 1961), ch. 3, sec. A, par. 4 and 5.

2. Advance collections for the future delivery of goods or performance of service—for instance, obligations under short-term derivative financial instruments (such as options to sell stock) as well as unearned rent and unearned ticket sales. These latter items sometimes are referred to as short-term deferred (unearned) revenues.
3. Other obligations that will be paid within one year or the operating cycle, such as short-term notes payable, interest payable, dividends payable, income taxes payable, the estimated liability for short-term product warranties, and the portions of long-term liabilities that mature during this period.<sup>11</sup>

These obligations are listed on the balance sheet at the amount owed (historical proceeds) or estimated to be owed. Example 4-1 shows the current liabilities section of the Caron Manufacturing Company.

#### EXAMPLE 4-1 Balance Sheet

##### CARON MANUFACTURING COMPANY

##### Balance Sheet December 31, 2007

##### Assets

##### Current Assets

Cash		\$ 14,300	
Temporary investments in available for sale securities		19,700	
Accounts receivable	\$ 68,200		
Less: Allowance for doubtful accounts	<u>(3,200)</u>		65,000
Inventories			
Raw materials	\$ 32,000		
Work in process	49,500		
Finished goods	<u>66,100</u>		147,600
Prepaid items			
Insurance	\$ 4,800		
Office supplies	<u>2,200</u>		7,000
Total current assets			\$253,600

##### Long-Term Investments

Investment in held-to-maturity bonds		\$ 17,000	
Fund to retire long-term bonds payable		<u>17,400</u>	
Total long-term investments			34,400

##### Property, Plant, and Equipment

	Cost	Accumulated Depreciation	Book Value
Land	\$ 36,000	—	\$ 36,000
Buildings	428,000	\$207,000	221,000
Equipment	<u>192,000</u>	<u>63,700</u>	<u>128,300</u>
Totals	\$ 656,000	\$270,700	\$385,300
Total property, plant, and equipment			385,300

##### Intangible Assets

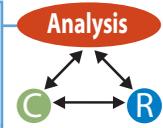

Trademarks		\$ 12,600	
Patents (net)		<u>16,900</u>	
Total intangible assets			<u>29,500</u>
Total Assets			<u>\$702,800</u>

11. *Ibid.*, par. 7.

An obligation that is due within the next accounting period but which will be refinanced by issuing new long-term liabilities is not classified as a current liability. This obligation is not a current liability, because it will not require the use of current assets to satisfy the debt.

## Working Capital

The working capital of a company is the financial resources it uses during its operating cycle. **Working capital is the excess of a company's current assets over its current liabilities.** Although a company seldom computes its working capital on the balance sheet, it is often used by creditors and others as an indicator of the short-run liquidity of the company. Often external users use a slightly different computation, the **current ratio** (current assets divided by current liabilities), for the same purpose. Users must be careful when using the current ratio because the liquidity *composition* of the current assets is very important. The FASB has suggested several general guidelines for more homogeneous classifications of assets to help external users assess the nature, amounts, and liquidity of available resources. One classification alternative might be to separate the current assets

### EXAMPLE 4-1 (Continued)

#### Liabilities

##### Current Liabilities

Accounts payable		\$ 87,100	
Salaries payable		3,300	
Income taxes payable		27,400	
Advances from customers		19,600	
Current portion of mortgage payable		<u>8,400</u>	
Total current liabilities			\$145,800

##### Long-Term Liabilities

Bonds payable (10%, due 2020)	\$ 90,000		
Less: Unamortized bond discount	<u>(8,200)</u>	\$ 81,800	
Mortgage payable (12%, due 2009–2012)		52,600	
Accrued pension cost		<u>34,700</u>	
Total long-term liabilities			169,100

##### Other Liabilities

Deferred income taxes			<u>14,300</u>
Total Liabilities			\$329,200

#### Stockholders' Equity

##### Contributed Capital (see Example 4-2)

Common stock, \$5 par (20,000 shares authorized, 14,300 shares issued and outstanding)		\$ 71,500	
Additional paid-in capital on common stock		<u>173,900</u>	
Total contributed capital			\$245,400

##### Retained Earnings (see Example 4-2)

Accumulated Other Comprehensive Income			116,200
Unrealized increase in value of available-for- sale securities (see Example 4-2)			<u>12,000</u>

Total Stockholders' Equity			<u>\$373,600</u>
Total Liabilities and Stockholders' Equity			<u>\$702,800</u>

into two groups. The first group would include the *liquid* assets of cash and temporary investments in marketable securities that are immediately convertible into cash. The second group would include *separable assets*, those assets that can be separated from the company and converted into cash but with some time lag and conversion costs. These would include items such as receivables and inventories.<sup>12</sup> Users can develop alternative groupings of current assets and current liabilities, as well as other ratios for assessing liquidity and financial flexibility.

### Real Report 4-1 Inventory Disclosures

#### JOHNSON & JOHNSON

At January 2, 2005 and December 28, 2003 (in millions)	2004	2003
Current assets (in part):		
Inventories (Notes 1 and 2)	\$3,744	\$3,588
NOTES TO CONSOLIDATED FINANCIAL STATEMENTS (in part):		
<b>2 Inventories</b>		
At the end of 2004 and 2003, inventories were comprised of:		
<b>(Dollars in Millions)</b>	<b>2004</b>	<b>2003</b>
Raw materials and supplies	\$ 964	\$ 966
Goods in process	1,113	981
Finished goods	<u>1,667</u>	<u>1,641</u>
	<u>\$3,744</u>	<u>\$3,588</u>

#### Questions:

1. What is the percentage of each type of inventory for 2004 and 2003?
2. Why might you be concerned (or optimistic) in regard to the changes in the percentages?

### Long-Term Investments

Companies make investments for several reasons. They may be interested in appreciation of the investment (the company expects the market value of the investment to increase), in income from interest or dividends, in exercising control over certain other companies, as in the case of a subsidiary or a major supplier, and in using the investment for specific future purposes such as the acquisition of property, plant, and equipment for expansion. Whether or not the investment is readily marketable, **if the company expects to hold the item for more than one year or the operating cycle, whichever is longer, it is classified as a long-term (noncurrent) investment.**

Long-term investments include holdings of available-for-sale debt and equity securities that the company does not intend to convert into cash within one year or the normal operating cycle (if longer than a year). Long-term investments also include investments in debt securities (e.g., bonds) expected to be held to maturity, noncurrent notes receivable from unaffiliated companies, long-term advances to unconsolidated affiliated companies, and financial instruments (such as options to buy stock) that are noncurrent. Investments in property and equipment being held for future operations, such as land being held for a future building site, also are included. Special funds established to retire

12. For a further discussion, see "Reporting Funds Flows, Liquidity, and Financial Flexibility," *FASB Discussion Memorandum* (Stamford, Conn.: FASB, 1980), ch. 8 and 9.

bonds payable or preferred stock (often called sinking funds) or to acquire future facilities are included as long-term investments. Finally, miscellaneous investments, including the cash surrender value of life insurance policies, should be listed in this section of the balance sheet. Investments are listed at their fair value, historical cost, book value, or present value, depending on the type of investment. The method of valuation for each long-term investment should be disclosed either parenthetically or in the notes to the financial statements. Example 4-1 illustrates the long-term investments section of Caron Manufacturing Company.

## Property, Plant, and Equipment

The property, plant, and equipment section of a company's balance sheet includes the tangible assets used in its operations. Often these are called *fixed assets* because of their relative permanency in the company's operations. A merchandising company sometimes will title this section Property and Equipment because it does not have manufacturing (plant) facilities. Assets that have a physical existence, such as land, buildings, equipment, machinery, furniture, and natural resources are listed in this category. Except for land, all the fixed assets are depreciable or depletable (in the case of natural resources). Land is listed at its historical cost, while the remaining fixed assets are listed at their book values (historical cost less accumulated depreciation or depletion). A *contra-asset* account, such as accumulated depreciation, usually is used to reduce fixed assets to their book values while still disclosing the historical cost. The method of depreciating the fixed assets is disclosed in the notes to the financial statements. In the case where the earning power of a fixed asset has been impaired, it is reported at a reduced fair value. Example 4-1 illustrates the property, plant, and equipment section of Caron Manufacturing Company. Some companies show a total amount of property, plant, and equipment on their balance sheets and a breakdown in the related notes. This procedure is used by **Campbell Soup Company** for its plant assets, as we show in Real Report 4-2.

### Real Report 4-2 Plant Assets

CAMPBELL SOUP COMPANY		
	August 1, 2004	August 3, 2003
(in millions)		
Assets (in part):		
Plant assets, net of depreciation (Note 14)	\$1,901	\$1,893
NOTES TO CONSOLIDATED FINANCIAL STATEMENTS (in part):		
14 Plant Assets (in part):		
	2004	2003
Land	\$ 70	\$ 66
Buildings	1,009	974
Machinery and equipment	2,977	2,827
Projects in progress	192	145
	4,248	4,012
Accumulated depreciation	(2,347)	(2,169)
	<u>\$1,901</u>	<u>\$1,843</u>

### Questions:

1. What percentage of the total cost is "projects in progress" on August 3, 2003, and August 1, 2004?
2. What might this indicate?

Certain long-term lease contracts relating to leased property, plant, and equipment also are included in this section. Long-term leases of assets are a popular way for a lessee to acquire the rights to the use of the assets without a large cash down payment. In the case of a *capital lease*, one that has many of the characteristics of a purchase, both the assets and the liabilities sections of the lessee's balance sheet are affected. Since the lease allows the lessee company relatively unrestricted rights to the use of the asset for an extended period, the rights are economic resources to the company, even though the asset is not legally owned. The lessee initially records a capital lease as an asset, Leased Equipment, at the present value of the future lease payments. It is amortized in a manner similar to other legally owned assets of the company. The book value of the leased asset is reported in the property, plant, and equipment section. Similarly, since the capital lease payments are noncancelable over an extended number of years, these payments are a long-term liability of the lessee company. The obligation for a capital lease also is recorded initially at the present value of the future lease payments and then reduced by the amount of each lease payment (after adjustment for interest). As we discuss later in this chapter, the capital lease liability is reported in the long-term liabilities section of the balance sheet. We discuss the accounting for capital leases in Chapter 21.

### Intangible Assets

**Intangible assets are those noncurrent economic resources that a company uses in its operations but have no physical existence.** They generally derive their value from the rights held by the company for their use. A company may have three categories of intangible assets: (1) intangible assets with finite useful lives, (2) intangible assets with indefinite lives, and (3) goodwill. Intangible assets with finite useful lives (such as patents, franchises, and computer software costs) are amortized over their useful lives and reported on the balance sheet at their book values (historical cost less accumulated amortization). The accumulated amortization of these intangibles is disclosed in the notes to the financial statements. Intangible assets with indefinite useful lives (such as trademarks) are not amortized, but are reviewed for impairment annually. Impairment arises when the earning power of an intangible asset has been reduced to the point where its fair value is less than its historical cost. These intangible assets are reported on the balance sheet at their historical cost or, if impaired, at their lower fair value. Goodwill, another type of intangible asset, is not amortized but is also reviewed for impairment annually. Goodwill is also reported on the balance sheet at its historical cost or, if impaired, at its lower fair value. Many companies have valuable "intangible assets," such as their human resources and intellectual capital (employees), but these resources are not reported on the balance sheet because of the difficulty in reliably measuring their value. Example 4-1 illustrates the intangibles section of Caron Manufacturing Company. We discuss the accounting for intangible assets in Chapter 12.

### Other Assets

Finally an "Other Assets" section occasionally is used to report miscellaneous assets that may not "fit" in one of the previous sections. This section sometimes is referred to as *deferred charges*. Examples of items that have been classified in this section include long-term prepayments (such as for rent or insurance), deferred tax assets, prepaid pension costs, bond issue costs, assets of a component of the company that is being discontinued, advances to officers, idle fixed assets, cash from customers' security deposits on returnable containers, assets leased to others, and assets temporarily restricted by foreign countries. Classification within this section should be made judiciously. Many items that are listed in this section might be classified correctly in one of the previous sections.

### Long-Term Liabilities

**Long-term liabilities are those obligations of a company that it does not expect to liquidate using current assets or creating current liabilities within one year or the normal operating cycle (whichever is longer).** Long-term liabilities may be called **noncurrent liabilities**. Many of these obligations may be outstanding for several years. Items such as long-term notes payable, capital lease obligations, mortgages payable, obligations

under noncurrent financial instruments (e.g., options to sell stock), estimated liabilities from long-term warranties, accrued pension cost (i.e., obligation for future pension payments), and bonds payable are included in this category.

To finance its activities, a corporation may issue long-term bonds (sometimes called debentures or notes). A bond is a written promise to repay a specific amount (its *face value*) at some future maturity date. Nearly all bonds also pay a specified interest rate (either semiannually or annually) that may vary from company to company. Many bonds sell in a bond market similar to that of a stock market. Frequently a corporation may issue a bond at more or less than its face value. This occurs when the bond pays a stated interest rate greater or less than the yield rate investors can earn elsewhere on a similar security, making it more or less valuable.

When a bond is issued for more than its face value, it is sold at a *premium*; when it is issued for less, it is sold at a *discount*. At the time of sale the Bonds Payable account is recorded at the face value of the bond, and an adjunct account called Premium on Bonds Payable (or a *contra* account called Discount on Bonds Payable) is used to record the amount by which the selling price is greater than (or less than) the face value. Then, each period this premium (or discount) is amortized as an adjustment to interest expense (generally by use of a present value approach), and at the maturity date only the face value of the bonds payable remains. Whenever a balance sheet is prepared, the remaining premium is added to (or the discount is subtracted from) the face value of the bonds payable to determine the book value. Most long-term liabilities are reported at their present value, but some are listed at cost. Any applicable interest rates, maturity values, and other provisions are disclosed parenthetically on the balance sheet or in the notes to the financial statements. Example 4-1 illustrates the long-term liabilities section of Caron Manufacturing Company. Some companies show a total amount of long-term liabilities on their balance sheets and a schedule of the individual amounts in the related notes. This procedure is used by Kimberly-Clark for its long-term debt, as we show in Real Report 4-3.

### Real Report 4-3 Long-Term Debt

#### KIMBERLY-CLARK CORPORATION

#### Liabilities and Stockholders' Equity (in part):

	December 31	
	2004	2003
(in millions)		
Long-term Debt	\$2,298.0	\$2,733.7

#### NOTES TO CONSOLIDATED FINANCIAL STATEMENTS (in part):

#### Note 4. Debt (in part)

#### Long-term debt is composed of the following:

	Weighted-Average Interest Rate	Maturities	December 31	
			2004	2003
Notes and debentures	5.77%	2005–2038	\$2,309.8	\$2,342.9
Industrial development revenue bonds	2.58%	2006–2037	300.7	381.3
Bank loans and other financings in various currencies	7.22%	2005–2031	272.9	194.9
Total long-term debt			<u>2,883.4</u>	<u>2,919.1</u>
Less current portion			<u>585.4</u>	<u>185.4</u>
Long-term portion			<u>\$2,298.0</u>	<u>\$2,733.7</u>

*Continued*

Fair value of total long-term debt, based on quoted market prices for the same or similar debt issues, was approximately \$3.0 billion and \$3.1 billion at December 31, 2004 and 2003, respectively. Scheduled maturities of long-term debt for the next five years are \$585.4 million in 2005, \$64.8 million in 2006, \$336.7 million in 2007, \$19.7 million in 2008, and \$5.1 million in 2009.

At December 31, 2004, the Corporation had \$1.2 billion of revolving credit facilities. These facilities, unused at December 31, 2004, permit borrowing at competitive interest rates and are available for general corporate purposes, including backup for commercial paper borrowings. The Corporation pays commitment fees on the unused portion but may cancel the facilities without penalty at any time prior to their expiration. Of these facilities, \$600 million expires in September 2005 and the balance expires in November 2009.

Debt payable within one year is as follows:

	December 31	
	2004	2003
	(Millions of dollars)	
Commercial paper	\$ 526.3	\$533.5
Current portion of long-term debt	585.4	185.4
Other short-term debt	103.0	145.4
Total	<u>\$1,214.7</u>	<u>\$864.3</u>

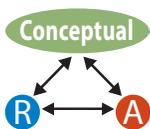

At December 31, 2004 and 2003, the weighted-average interest rate for commercial paper was 2.3 percent and 1.0 percent, respectively.

### Questions:

1. What information regarding cash flows is available in the note but is not available in the balance sheet?
2. Compute the approximate interest expense on the notes and debentures for the year ended December 31, 2004.
3. Provide an estimate of what the interest expense on the notes and debentures will be for the year ended December 31, 2005. What assumptions must be made to provide this estimate?

## Other Liabilities

A final section sometimes is used to report miscellaneous liabilities. This section might include items such as deferred tax liabilities, obligations of a component of the company that is being discontinued, and long-term advances from customers. As in the case of other assets, this category should be used judiciously.

## Conceptual Guidelines for Reporting Assets and Liabilities

In the previous sections we discussed the typical classifications of assets and liabilities in a balance sheet. A company, however, should classify its assets and liabilities in the most informative manner for its external user groups. In addition to the “liquid” and “separable” subclassifications of current assets we discussed earlier, the FASB has suggested several guidelines for developing *homogeneous classes* of assets and liabilities. These guidelines include:

1. Reporting assets according to their type or expected function in the central operations or other activities of the company. For example, assets held for resale (inventory) should be reported separately from assets held for use in production (property, plant, and equipment).

2. Reporting as separate items assets and liabilities that affect the financial flexibility of the company differently; for example, assets used in operations, assets held for investment, and assets subject to restrictions (such as leased equipment).
3. Reporting assets and liabilities according to the fair value method used to value the items; for example, assets and liabilities measured at net realizable value versus those measured at current cost.

These general guidelines are intended to result in asset and liability classifications that help users assess the nature, amounts, and liquidity of available resources. This includes the intentions of management regarding their use, and the amounts and timing of obligations that require liquid resources for settlement.

The AICPA Special Committee on Financial Reporting extends these guidelines by suggesting that companies distinguish between “core” and “non-core” assets and liabilities. Core assets and liabilities result from a company’s usual and recurring activities, transactions, and events. Conversely, non-core assets result from unusual or non-recurring activities, transactions, or events. For instance, non-core assets might include a receivable related to an unusually large sale of inventory that is not expected to recur in the future. Non-core liabilities might include those related to a discontinued component.<sup>13</sup>

## Stockholders’ Equity

**Stockholders’ equity is the residual interest of the stockholders in the assets of the corporation.** A company may be organized in three different ways: as a sole proprietorship, a partnership, or a corporation.

A sole proprietorship is a single-owner company. This is usually a small company where the owner acts as manager and has direct access to the accounting records. Therefore, separate accounts typically are not used for the owner’s investment and retained earnings. Normally, the total owner’s equity is summarized in a single *capital* account.

A partnership involves two or more persons who have agreed to combine their capital and efforts in the operations of a company. The partnership generally has a *partnership agreement*, a legal document that includes the investment requirements, allocation of income, and withdrawal provisions for each partner. Separate capital accounts are used for each partner to summarize the partner’s equity.

The corporation is the most complex business organization. Usually there is *absentee* ownership, where most of the stockholders are not involved in managing the corporation. To protect these absentee owners, state laws have been established, many of which relate to the accounting for stockholders’ equity. Stockholders’ equity consists of three components: (1) contributed capital, (2) retained earnings, and (3) accumulated other comprehensive income.

**6** Report the stockholders’ equity of a balance sheet.

## Contributed Capital

The owners of a corporation hold shares of stock in that corporation. A stockholder may acquire shares directly from the corporation or by purchasing them on the stock market from another investor. The corporation’s balance sheet is affected only in the first case. Most state laws protecting stockholders and creditors require a certain amount of legal capital. **Legal capital is the minimum amount of stockholders’ equity that the corporation may not distribute as dividends;** it is one element of the total amount of contributed capital. Accounting for contributed capital follows these legal requirements. Contributed capital frequently is separated into two components, capital stock (relating to the legal capital) and additional paid-in capital.

13. “Reporting Income, Cash Flows, and Financial Position of Business Enterprises,” *FASB Proposed Statement of Financial Accounting Concepts*, *op. cit.*, par. 50, 51, and 170, and “Improving Business Reporting—A Customer Focus,” *AICPA Special Committee on Financial Reporting* (New York: AICPA, 1994), App. II, pp. 138–139.

## Capital Stock and Additional Paid-In Capital

Corporations may issue two types of capital stock, preferred stock and common stock. **Preferred stock** has different ownership features (which some investors consider more attractive) from common stock, including the first right to a specified dividend, if one is paid. **Common stock** carries the right to vote at the annual stockholders' meeting and to share in residual profits. The corporate charter includes

the number of shares that a corporation is legally authorized to issue, as well as the types and characteristics of its capital stock. Common stock is the most prevalent type of capital stock. Each of these types of stock typically sells on a stock market, which establishes its *market value* per share.

Based upon state laws, a corporation may issue (1) par value, (2) stated value, or (3) no-par (no stated value) capital stock. Legally, capital stock may be required to carry a par value or a stated value. Par value or stated value refers to a specific dollar amount per share that is printed on the stock certificate.<sup>14</sup> Often this par value is a very small amount, say \$1 or \$5 per share, because states generally do not allow a corporation to issue stock at less than par. For instance, the par value of **Honeywell's** common stock is \$1 per share. The par value of a share of stock has no direct relationship to the share's market value. Nonetheless, the legal (par) value must be accounted for separately.

When a corporation issues par value capital stock (common or preferred), it must allocate the amount it receives (market price) between a capital stock account for the par value and another contributed capital account for the difference between the par and the market value. This latter account has a title such as Additional Paid-in Capital, Paid-in Capital in Excess of Par, or Premium on Common (or Preferred) Stock. For instance, if a corporation sold 100 shares of its \$5 par common stock for \$30 per share, the journal entry to record the transaction is as follows (the number of shares issued in the transaction is also recorded):

<b>Cash</b>	<b>3,000</b>	
<b>Common Stock, \$5 par</b>		<b>500</b>
<b>Additional Paid-in Capital on Common Stock</b>		<b>2,500</b>

Many states allow corporations to issue no-par capital stock. When a corporation issues no-par capital stock, the amount it receives from the sale usually is the legal capital, and the corporation records the entire amount in the capital stock account. Due to various other stock transactions, it is possible for a corporation issuing no-par stock to have certain additional paid-in capital accounts.

A corporation sometimes will repurchase its own capital stock. When it does, the number of shares outstanding is reduced. The corporation usually records the *cost* of the reacquisition in a contra stockholders' equity account entitled **Treasury Stock**. This account has a debit balance and the corporation deducts the amount from the total of

14. There are certain legal differences between par value and stated value. We discuss these in Chapter 16. Since the accounting for stated value stock generally is identical to that for par value stock, here we focus on par value stock.

contributed capital, retained earnings, and accumulated other comprehensive income to determine its total stockholders' equity.

Regardless of whether a corporation issues par or no-par stock, the corporation lists the balances in the Preferred Stock, Common Stock, and Additional Paid-in Capital accounts separately on its balance sheet and sums the amounts to determine the total amount of its contributed capital. The par value or stated value per share, as well as the number of shares authorized, issued, and outstanding, should be disclosed either parenthetically in the contributed capital section or in the notes to the financial statements. Example 4-1 illustrates the contributed capital section of Caron Manufacturing Company.

## Retained Earnings

**Retained earnings is the total amount of corporate net income that has not been distributed to stockholders as dividends.** A corporation may retain the assets generated from this net income to use in its daily operations, to maintain its productive facilities, or for growth. In any event, a retained earnings balance has no relationship to the cash that is available for dividends. The resources generated by net income are invested in all assets. The Retained Earnings account balance is an addition in stockholders' equity. A negative (debit) retained earnings balance (due to cumulative net losses and dividends exceeding cumulative net income), called a *deficit*, is subtracted in stockholders' equity.

Sometimes a company *restricts* or *appropriates* a portion of retained earnings to indicate that it cannot be reduced by the distribution of dividends. This may occur as a result of a legal or contractual requirement. Usually, such a restriction is disclosed in the notes to the financial statements.

## Accumulated Other Comprehensive Income

As we discuss in Chapter 5, a company is required to report its total comprehensive income for the accounting period. Comprehensive income includes both net income and "other comprehensive income." Other comprehensive income (loss) may include four items: (1) unrealized increases (gains) or decreases (losses) in the market (fair) value of investments in available-for-sale securities, (2) translation adjustments from converting the financial statements of a company's foreign operations into U.S. dollars, (3) certain gains and losses on "derivative" financial instruments, and (4) certain pension liability adjustments.

A corporation includes its total net income earned to date in its retained earnings amount reported in stockholders' equity. The corporation includes its other comprehensive income (or loss) accumulated to date in its **accumulated other comprehensive income (or loss)** amount reported in stockholders' equity. If a corporation has more than one item of other comprehensive income, it has a choice. It may report the amount of accumulated other comprehensive income for each item in stockholders' equity. Or, it may report the total amount of accumulated other comprehensive income for all the items in stockholders' equity. If the corporation uses this approach, it must disclose the amounts for each of the items in the notes to its financial statements.<sup>15</sup>

**General Motors Corporation** uses the first approach. In the stockholders' equity section of its December 31, 2004 balance sheet, General Motors reported an accumulated other comprehensive loss of \$2,285 million, consisting of four items as follows:

Accumulated foreign currency translation adjustments	\$(1,194)
Net unrealized gains on derivatives	589
Net unrealized gains on securities	751
Minimum pension liability adjustment	<u>(3,031)</u>
Accumulated other comprehensive loss	<u>\$(2,885)</u>

15. "Reporting Comprehensive Income," *FASB Statement of Financial Accounting Standards No. 130* (Norwalk, Conn.: FASB, 1997), par. 17 and 26.

The Caron Manufacturing Company has one item of accumulated other comprehensive income, as we show in Example 4-1. Unless a corporation has miscellaneous items of equity (discussed next), it adds the totals for contributed capital, retained earnings, and accumulated other comprehensive income to determine the total stockholders' equity.

### Miscellaneous Items

In rare instances a company may increase its assets without a corresponding outflow of assets, increase in liabilities, recognition of income, or issuance of capital stock. For instance, a company may receive donated assets from a governmental unit or it may discover previously unrecorded assets. In either case, when the company records the asset's fair value it also increases stockholders' equity. These items are listed separately in stockholders' equity.

### SECURE YOUR KNOWLEDGE 4-2

- When presenting the elements of a balance sheet, a company will simplify, condense, and classify the financial information in order to improve the usefulness of the information for the external users.
- The classification of assets and liabilities as current and noncurrent is a key distinction made on a company's balance sheet that allows users to more easily assess its liquidity and financial flexibility.
- Assets that are expected to provide economic benefits for more than one year or the operating cycle, whichever is longer, are classified as noncurrent assets and include long-term investments, property, plant, and equipment, and intangible assets.
- Obligations that will not be satisfied within one year or the operating cycle, whichever is longer, are classified as noncurrent liabilities and include long-term notes payable, bonds, and capital lease contracts.
- Stockholders' equity, the residual interest in the assets of the corporation, consists of contributed capital, retained earnings, and accumulated other comprehensive income.

## STATEMENT OF CHANGES IN STOCKHOLDERS' EQUITY

When a corporation issues financial statements, it must disclose the changes in its stockholders' equity accounts. This disclosure may be in a financial statement, a supporting schedule, or a note to the financial statements.<sup>16</sup> This reporting is consistent with the FASB's suggestion that a full set of financial statements should show, among other information, investments by and distributions to owners during the period. The intent is to help report on the changes in a company's financial structure to help users in assessing its financial flexibility.

FASB Statement of Concepts No. 6 defines investments by owners and distributions to owners, as follows:

**Investments by owners are increases in the equity of a company resulting from transfers of something valuable to the company from other entities to obtain or increase ownership interests.**

**Distributions to owners are decreases in the equity of a company caused by transferring assets, rendering services, or incurring liabilities to owners.**

Assets are the economic resources most commonly received by a company from investments by owners, but the items received may include services or the conversion of liabilities

**7** Prepare a statement of changes in stockholders' equity.

16. "Omnibus Opinion—1967," *APB Opinion No. 12* (New York: AICPA, 1967), par. 10.

of the company. Through investments by owners, a company obtains the resources it needs to begin or expand operations, to retire liabilities, or for other business purposes. Distributions by a company to its owners decrease its net assets and decrease or terminate ownership interests of those who receive them.<sup>17</sup>

To disclose investments by and distributions to owners, many companies will prepare a statement of changes in stockholders' equity, which combines the retained earnings changes and the changes in accumulated other comprehensive income with the other capital account changes. Example 4-2 illustrates this statement. Note that the totals of the columns in this example are the same as those shown in the stockholders' equity section of Example 4-1.

#### EXAMPLE 4-2 Statement of Changes in Stockholders' Equity

##### SCHEDULE A

##### CARON MANUFACTURING COMPANY

##### Statement of Changes in Stockholders' Equity For Year Ended December 31, 2007

	Common Stock, \$5 par	Additional Paid-in Capital	Retained Earnings	Accumulated Other Comprehensive Income	Total
Balance, January 1, 2007	\$65,000	\$143,400	\$ 64,900	\$10,000	\$283,300
Unrealized increase in value of available-for-sale securities				2,000	2,000
Net income			62,500		62,500
Cash dividends paid			(11,200)		(11,200)
Common stock issued	6,500	30,500			37,000
Balance, December 31, 2007	<u>\$71,500</u>	<u>\$173,900</u>	<u>\$116,200</u>	<u>\$12,000</u>	<u>\$373,600</u>

## OTHER DISCLOSURE ISSUES

A company cannot report all the relevant financial information about its activities directly in the body of the financial statements because some items do not meet the recognition criteria we discussed earlier in the chapter. As indicated throughout the balance sheet discussion, a company may make many disclosures in the notes accompanying its financial statements. We discuss other significant disclosure issues here.

**8** Understand the other disclosure issues for a balance sheet.

### Summary of Accounting Policies

To understand a company's financial statements, an external user needs to know the company's accounting policies, practices, and methods. For this reason, generally accepted accounting principles require the disclosure of certain information in a company's annual report.

**APB Opinion No. 22** requires that a company include a description of all its significant accounting policies. The disclosure should include principles relating to revenue recognition and asset allocation, particularly when these principles and methods involve (1) a selection from existing acceptable alternatives, (2) principles and methods peculiar to the industry in which the company operates, and (3) unusual or innovative applications of generally accepted accounting principles. Examples cited include, among others, those policies related to the basis for consolidation, depreciation methods, amortization of intangibles,

17. FASB *Statement of Financial Accounting Concepts No. 6, op. cit.*, par. 66–69.

inventory pricing, recognition of profits on long-term contracts, and revenue recognition from franchise and leasing operations. Although allowing for flexibility, the disclosure is particularly useful when made in a separate *Summary of Significant Accounting Policies* preceding the notes to the financial statements or as the initial note.<sup>18</sup> We show this summary (in part) for the **Black & Decker Corporation** in Real Report 4-4. We include a complete summary in the *Coca-Cola Company's* notes to its financial statements in Appendix A.

### Real Report 4-4 Summary of Accounting Policies

#### BLACK & DECKER CORPORATION

#### Notes to Consolidated Financial Statements (in part)

#### Note 1: Summary of Accounting Policies (in part):

*Principles of Consolidation:* The Consolidated Financial Statements include the accounts of the Corporation and its subsidiaries. Intercompany transactions have been eliminated.

*Inventories:* Inventories are stated at the lower of cost or market. The cost of United States inventories is based primarily on the last-in, first-out (LIFO) method; all other inventories are based on the first-in, first-out (FIFO) method.

*Property and Depreciation:* Property, plant, and equipment is stated at cost. Depreciation is computed generally on the straight-line method for financial reporting purposes.

#### Questions:

1. Why is it important to disclose the accounting method used to compute the cost of inventory and to compute depreciation?
2. If the company used accelerated depreciation for financial reporting purposes, how would the income statement and balance sheet be affected?

### Fair Value and Risk of Financial Instruments

Some companies, many of which are banks and brokerage firms, deal in financial instruments. These *financial instruments* include items such as notes payable and receivable, contracts for loan commitments, collateralized mortgages, interest rate swaps, and put and call options on stocks. In recent years, both the types and uses of financial instruments have increased to the point where the FASB has addressed the reporting and disclosure of their fair values and risk. **FASB Statement No. 107** requires a company to disclose the fair value of all its financial instruments (both assets and liabilities), whether or not they are reported on its balance sheet. The *Statement* also requires a company to disclose all significant concentrations of credit risk due to its financial instruments. A company typically makes these disclosures in the notes to its financial statements.

**FASB Statement No. 133** requires a company to report all *derivative financial instruments* as either assets or liabilities on its balance sheet, and to measure these items at their fair value. A derivative financial instrument is, for example, an option to buy stock where the value of the option depends on the price of the stock. The *Statement* also requires a company to disclose information such as the types of derivative instruments it holds, its objectives in holding the instruments, and its strategies for achieving these objectives. The description must indicate the company's risk management policy in regard to each type of instrument. The intent of these disclosures is to improve the reporting of a company's *risk, liquidity, and financial flexibility*.<sup>19</sup> We discuss disclosures about fair values and risks of financial instruments in Chapter 13 and the Appendix to Chapter 15.

18. "Disclosure of Accounting Policies," *APB Opinion No. 22* (New York: AICPA, 1972), par. 8, 12, 13, and 15.

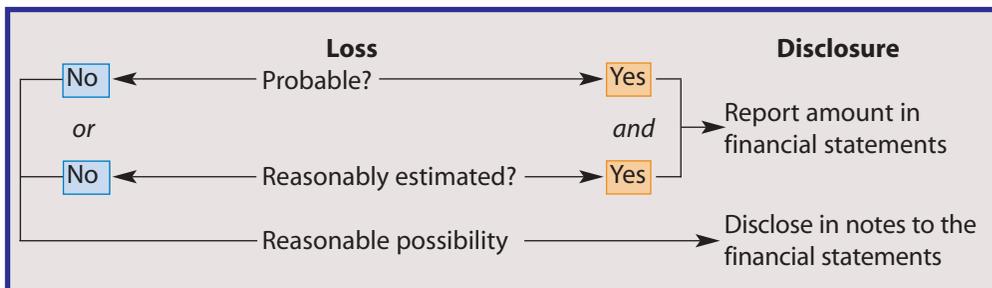

19. "Disclosures About Fair Value of Financial Instruments," *FASB Statement of Financial Accounting Standards No. 107* (Norwalk, Conn.: FASB, 1991) and "Accounting for Derivative Instruments and Hedging Activities," *FASB Statement of Financial Accounting Standards No. 133* (Norwalk, Conn.: FASB, 1998).

## Loss and Gain Contingencies

Certain situations may exist for a company on its balance sheet date that involve uncertainty as to possible losses or gains that the company may incur if some future event(s) occurs or fails to occur. These are known as **loss contingencies** or **gain contingencies** and may need to be included directly in the company's financial statements by recording a journal entry, or disclosed in a note accompanying the financial statements.<sup>20</sup>

A company accrues (reports a loss and a liability or a reduction of an asset) an estimated loss (or expense) from a loss contingency if (1) it is *probable* that a liability has been incurred (or an asset impaired) and (2) the amount of the loss can be *reasonably estimated*. Examples of this type of loss contingency include product warranties and uncollectible accounts receivable. If either of these conditions is *not* met—that is, if there is only a reasonable possibility that the loss may have been incurred or if the amount of the loss cannot be reasonably estimated—the company discloses the loss contingency in the notes to its financial statements.

The following diagram illustrates the alternative ways of accounting for loss contingencies:

The disclosure of any loss contingencies of a company is important to provide external users with additional information for helping predict its use of its financial resources in the future. Examples of a loss contingency that are disclosed in the notes to the financial statements include guarantees of the debts of others and pending litigation against the company, where either the outcome of the litigation or the amount of possible loss is uncertain. An illustration of this type of contingency for **Pinnacle Entertainment Inc.** is shown in Real Report 4-5. Gain contingencies are not reported in a company's financial statements and, if disclosed in a note, should be carefully explained to avoid misleading implications as to the likelihood of future revenues or gains.<sup>21</sup> We discuss loss and gain contingencies in Chapter 13.

### Real Report 4-5 Contingency

PINNACLE ENTERTAINMENT INC.

Notes to Financial Statements (in part)

Note 11. Commitments and Contingencies

#### Legal

*Columbia Sussex Litigation.* On January 26, 2005, Columbia Sussex Corporation and three other plaintiffs filed a petition against the Missouri Gaming Commission and Casino One Corporation, a wholly owned subsidiary of the Company, in the Circuit Court of Cole County, Missouri. The plaintiffs seek to undo the Missouri Gaming Commission's approval of Casino One's docking site on the St. Louis riverfront under a claim for judicial review by

*Continued*

20. "Accounting for Contingencies," *FASB Statement of Financial Accounting Standards No. 5* (Stamford, Conn.: FASB, 1975), par. 1.

21. *Ibid.*, par. 8-17.

original writ, declaratory judgment, and writ of prohibition. The factual allegations for each claim are that the Commission could not grant approval to Casino One because the facility's planned gaming floor is allegedly not within 1,000 feet of the main channel of the Mississippi River, as required under the Missouri constitution. While the Company cannot predict the outcome of this litigation, management intends to defend it vigorously.

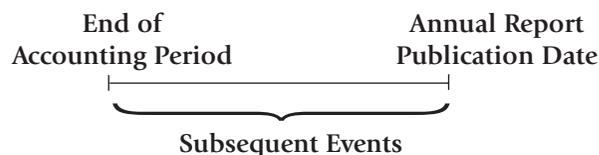

### Question:

1. What possible impact might settlement of this litigation have on Pinnacle Entertainment's future financial position or results of operations?

## Subsequent Events

A company usually does not issue its annual report for several weeks or months after the end of the accounting period because of the time needed for adjusting and closing the books and auditing the financial statements. During this time it is possible for significant business events and transactions to occur which, if not disclosed in the company's annual report, would cause this report to be misleading. Subsequent events are discussed more fully in an auditing book; we briefly summarize them here.

A subsequent event is one that occurs between a company's balance sheet date and the date when it issues its annual report, as we illustrate in the following time diagram:

If a subsequent event occurs that (1) provides additional evidence about conditions that *existed* on the balance sheet date and (2) significantly affects the estimate(s) used in preparing the company's financial statements, the company must make an adjustment to the financial statements. For instance, if a company obtains additional information indicating that a major customer's account receivable is unlikely to be collected, it makes an adjustment to the allowance for doubtful accounts and the bad debt expense.

When a subsequent event occurs that provides evidence concerning conditions that did *not* exist on the company's balance sheet date, but instead occurred after that date, the company does *not* adjust its financial statements. Instead, the information is disclosed in a note, pro forma ("as if") statement, or an explanatory paragraph in the audit report, depending upon the materiality of the financial impact. Examples of these events include a fire or flood loss, a litigation settlement, and the sale of a bond or stock issue after the balance sheet date.<sup>22</sup>

## Related Party Transactions

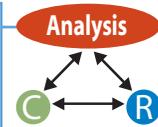

Transactions between related parties frequently occur in the normal course of business. Related parties of a company include affiliated entities such as subsidiaries, trusts for the benefit of employees, its management, and its principal owners or immediate families. Relationships between related parties may enable one of the parties to influence the other so that it is given preferential treatment. To provide sufficient information for external users to understand a company's financial statements, **FASB Statement No. 57** requires certain disclosures by the company. For related party transactions these include (1) the

22. AICPA Professional Standards, Volume 1 (New York: AICPA, 2004), sec. 560.03–560.09.

nature of the relationship involved, (2) a description of the transactions, (3) the dollar amounts of the transactions, and (4) any amounts due to or from the related parties on the balance sheet date.<sup>23</sup>

## Comparative Financial Statements

Examples 4-1 and 4-2 show the ending balance sheet and the statement of changes in stockholders' equity of the Caron Manufacturing Company for one year. Many external users are interested in comparing the current financial statements with those of the previous year. Also, many times *trend* information about a company will reveal useful insights about its past performance and future success. For this reason, nearly all companies present **comparative financial statements** for the current and preceding accounting periods. Additionally, in a supplemental schedule, most companies will present a summary of key accounting information for, say, the past 5 to 10 years. For instance, some companies report their **debt ratio** (total liabilities ÷ total assets) to help external users (creditors and stockholders) assess the risk of their investment in the company. We show the **Coca-Cola Company's** comparative financial statements Debt Ratio in Appendix A.

## Auditor's Report

Many major financial decisions by investors, bankers, other creditors, and other users are based on the financial information presented in a company's financial statements and related notes. These financial statements are the responsibility of the company's management. To help ensure a fair presentation of corporate financial resources, obligations, and activities, companies' financial statements and accompanying notes presented to external users are audited by an independent certified public accountant. In an audit, the certified public accountant is responsible for making an examination of a company's internal control, accounting system, records, and reports *in accordance with generally accepted auditing standards*. Based on this examination, the auditor expresses an *opinion* as to the *fairness in accordance with generally accepted accounting principles* of the company's financial statements and accompanying notes. Although this opinion is *not* itself part of the financial statements, it is an extremely important item of information, and one on which external users place much significance. We discuss the auditor's report in Chapter 6.

## SEC Integrated Disclosures

As we noted in Chapter 1, the Securities and Exchange Commission has the legal authority to prescribe accounting principles and reporting practices for all regulated ("publicly-held") companies. Each year, within 60 days of its fiscal year-end, a regulated company must file a *Form 10-K* annual report with the SEC. This report must be filed electronically according to the EDGAR requirements. Each company's chief executive and chief financial officer both must "certify" that the company's annual report within the Form 10-K (or interm report within the company's Form 10-Q) is both complete and accurate. The SEC has also developed an "integrated" set of disclosure requirements that enable a company to satisfy certain Form 10-K disclosure requirements by referring to its stockholders' annual report, provided the latter report includes certain items. Since many regulated companies now include these items in their annual reports, we briefly summarize the items as follows. For a more detailed discussion, see *Regulation S-X* of the SEC.

9 Describe the SEC integrated disclosures.

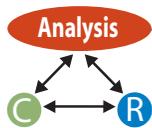

23. "Related Party Transactions," *FASB Statement of Financial Accounting Standards No. 57* (Stamford, Conn.: FASB, 1982), par. 2.

### Comparative Financial Statements

As we discussed in the previous section, most companies present comparative financial statements for at least two years. The SEC requires comparative balance sheets for *two* years and comparative income statements and statements of cash flows for *three* years.

### Selected Financial Data

As we discussed in the previous section, most companies present a summary of important accounting information for several years. The SEC requires *specific* disclosures for a *five-year period*. These include net sales or operating revenues, income (loss) from continuing operations and related earnings per share, total assets, long-term obligations and redeemable stock, and cash dividends declared per share. The SEC encourages the inclusion of other information that will help users understand and highlight trends.

### Management's Discussion and Analysis

A company's management must include a discussion and analysis (MD&A) of the company's financial condition, changes in financial condition, and results of operations. The intent is to give investors the opportunity to look at the company from management's perspective. Management is asked to discuss the dynamics of the company's business and to analyze the financial statements. The discussion is intended to provide "forward-looking" information that does not clearly appear in the financial statements but is useful in evaluating cash flows from operations and from outside sources. The major items covered should include, for instance, specific information about short-term and long-term liquidity and capital resources, a narrative discussion of the impact of inflation on sales and on income from continuing operations, a description of any significant unusual events and their effect on revenues and expenses, explanations of material changes in financial statement items between years, and known events and uncertainties expected to affect future operations. Other kinds of forward-looking information (e.g., trends) are required as well.

### Common Stock Market Prices And Dividends

Several disclosures must be made. These include the principal trading markets for the company's common stock, the high and low market prices for each quarter in the last two years, the approximate number of stockholders, the dividends paid in the last two years, and any dividend restrictions.

### Miscellaneous Disclosures

In addition to the disclosures discussed throughout this chapter, a company must make many other disclosures to provide adequate information concerning its activities. These include information about items such as the company's stock (share) option, pension, and insurance plans, long-term lease and purchase commitments, bond indenture provisions, notes receivable, and notes payable provisions. We discuss specific disclosure requirements as we address each topic in the remaining chapters.

### SECURE YOUR KNOWLEDGE 4-3

- A statement of changes in stockholders' equity discloses investments by and distributions to owners, as well as changes in retained earnings and accumulated other comprehensive income.
- The notes accompanying the financial statements contain relevant information about a company's activities that cannot be reported in the body of the financial statements.

(continued)

- Examples of disclosures made in the notes include the accounting policies, practices, and methods used by a company, the fair values and risks of financial instruments, contingent losses and gains, the existence of subsequent events, and any related party transactions.

## LINK TO INTERNATIONAL DIFFERENCES

One of the objectives of the IASB is to ensure, to the extent possible, that a company's published financial statements comply with international accounting standards. The financial statements required by the IASB are similar to those in the United States. They include a balance sheet, statement of changes in equity, income statement, and statement of cash flows, as well as related notes and other explanatory materials. However, International Accounting Standards do not *require* a particular format; the appropriate format depends on the type of company.

A company may classify its assets on the balance sheet into noncurrent assets and current assets, with noncurrent assets presented first. Noncurrent assets include property, plant, and equipment, as well as other items (investments, long-term receivables, intangibles). These classifications are similar to those in the United States. Current assets are also similar to those under U.S. GAAP.

The ordering of the liabilities and owners' equity sections is usually different than under U.S. GAAP, with "capital and reserves" listed first. The capital and reserves section includes issued capital, reserves, and accumulated profits (losses). The issued capital includes share capital and share premium. A company is required to disclose the par value, as well as the number of shares authorized, issued and fully paid, and issued but not fully paid. It must also disclose dividends that have been proposed but not formally approved for payment. Reserves may result from revaluations of properties and investments, as well as currency translation differences. A company must also provide a description of the nature and purpose of each reserve.

Noncurrent liabilities are usually listed next and include items such as interest-bearing borrowings, deferred income, deferred taxes, and retirement benefit obligations. Deferred income may include government grants, which are a form of financial assistance to a company for compliance with certain conditions. On the other hand, some government grants for the construction of assets are treated as a reduction in the book value of the asset. Current liabilities are listed last and are similar to those under U.S. GAAP. As with U.S. GAAP, a company is not required to separate its assets and liabilities into current and noncurrent classifications; it decides on the disclosures based on their usefulness.

A company's statement of changes in equity includes the changes in share capital and share premium, as well as any changes in the company's reserves due to, for instance, a surplus on the revaluation of properties or a deficit on the revaluation of investments. A company must also disclose any changes in accumulated profits (losses) due to changes in accounting policies, corrections of fundamental errors, net income, and dividends.

In the notes to its financial statements, a company is required to disclose items similar to those required under U.S. GAAP. These disclosures include its accounting policies, narrative descriptions of financial statement items, and contingencies. For revaluations, they also include the measurement basis used. Furthermore, companies in "hyperinflationary" economies (e.g., the cumulative inflation rate over three years exceeds 100 percent) are required to prepare general price-level-adjusted financial statements. In the following chapters, we briefly discuss the major differences between international and U.S. accounting standards as they apply to specific assets, liabilities, and income.<sup>24</sup>

24. For a more complete discussion, see Carrie Bloomer (editor), *The IASC—U.S. Comparison Project: A Report on the Similarities and Differences between IASC Standards and U.S. GAAP*, 2nd ed. (Norwalk, Conn.: FASB, 1999).

10 Explain the reporting techniques used in an annual report.

## REPORTING TECHNIQUES

Companies use several reporting techniques in the presentation of their annual reports. We discuss the major ones relating to the financial statement presentations next.

### Statement Format (Balance Sheet)

The format that a company uses for its balance sheet depends upon its size, the industry in which it operates, certain regulatory requirements, and tradition. Two basic formats are used: the report form or the account form.

Most companies use the **report form**. Here the balance sheet is shown in a vertical format. The asset accounts are listed first, and the liability and stockholders' equity accounts are listed in sequential order directly below the assets. In contrast, the **account form** of the balance sheet is organized in a horizontal fashion, with the asset accounts listed on the left-hand side and liabilities and stockholders' equity accounts on the right-hand side. This is the format used in Example 4-1. Of 600 companies surveyed, the report form and account form are used by 506 and 94, respectively.<sup>25</sup>

### Combined Amounts

To reduce the size of a company's financial statements, it may combine certain related amounts. For instance, a company may list a single amount for property and equipment on the face of its balance sheet and then itemize the amounts applicable to land, buildings, and equipment in a note to the financial statements. Frequently the amounts for inventories are similarly combined and itemized, as illustrated in Real Report 4-1 for **Johnson & Johnson**. Generally, it is *not* proper to offset asset and liability accounts. For instance, the amount in a special Bond Sinking Fund account to retire long-term bonds would not be offset against the Bonds Payable account balance. In a few circumstances, a *right of offset* exists whereby a debtor (Company A) has a legal right to discharge all or some of the liability owed to another party (Company B) by applying an amount that the other party (Company B) owes to the debtor (i.e., a receivable of Company A) against the liability.<sup>26</sup> For instance, when a bank loans money to a company in exchange for the company's accounts receivable that are assigned to the bank, the company would offset the assigned accounts receivable on its balance sheet against the liability owed to the bank. We discuss the right of offset in Chapter 7.

### Rounding

In Examples 4-1 and 4-2 the amounts presented for each account, subtotal and total, were rounded to the nearest hundred dollars. Rounding is usually done to increase readability and to reduce the likelihood that readers will attach more precision to the numbers than is warranted. In fact, many major companies round to the nearest million dollars. In the **Coca-Cola Company** financial statements shown in Appendix A, the amounts are rounded as indicated.

25. *Accounting Trends and Techniques*, (New York: AICPA, 2004), p. 149.

26. For the criteria to be met for a right of offset to exist, see "Offsetting of Amounts Related to Certain Contracts," *FASB Interpretation No. 39* (Norwalk, Conn.: FASB, 1992), par. 5 and "Offsetting of Amounts Related to Certain Repurchase and Reverse Repurchase Agreements," *FASB Interpretation No. 41* (Norwalk, Conn.: FASB, 1994), par. 3.

## Notes, Supporting Schedules, and Parenthetical Notations

Additional information not included in the accounts reported on a company's financial statements is disclosed in a note, supporting schedule, or parenthetical notation.

The **notes** (sometimes called *footnotes*) accompanying the financial statements are extremely useful ways of presenting additional information. Generally accepted accounting principles *require* that a company disclose certain information (for instance, contingent liabilities that are reasonably possible) in the notes to the financial statements, and it is good accounting practice to include additional note disclosures when they add to the completeness of the annual report. Notes usually contain narrative discussion, additional monetary amounts, and sometimes supplemental schedules.

We illustrated several notes of actual companies earlier in this chapter. We discuss required and suggested disclosures in notes throughout this book as they apply to specific topics. Because notes must communicate technical accounting information in a narrative format, there are several ways to improve their clarity and readability. When preparing and writing financial reporting notes, the accountant should (a) specify what data are to be disclosed, (b) outline the desired format of the note, (c) construct and use short sentences in the note, (d) use terminology understandable to the external user, and (e) be concise but complete.

**Supporting schedules** may be freestanding or part of the notes. A supporting schedule may complement an entire financial statement (such as the retained earnings statement) or may explain a summary amount on a specific financial statement (such as the categories of inventories, as we showed in Real Report 4-1). We discuss and illustrate supporting schedules throughout the book.

**Parenthetical notations** following specific accounts are used to explain items such as the method of valuation (e.g., cost, lower of cost or market) or of determining the ending inventory (e.g., average cost), or to cross-reference certain related asset and liability accounts (e.g., bond sinking fund and bonds payable).

## ILLUSTRATIVE STATEMENTS

Appendix A shows the actual financial statements and accompanying notes of the **Coca-Cola Company** for the year ended December 31, 2004. Although you may not understand all of these items at this point, pay particular attention to each statement's format and content and, in particular, to the notes accompanying the reports. Your understanding will increase as you study this book.

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

1. **Understand the purposes of the balance sheet.** A balance sheet summarizes the *financial position* of a corporation on a specific date by reporting on its assets, liabilities, and stockholders' equity. The balance sheet reports a corporation's *resource structure* and its *financial structure*.
2. **Define the elements of a balance sheet.** The elements of a balance sheet are the broad classes of items comprising it. The elements include assets, liabilities, and stockholders' equity. Briefly, assets are a corporation's economic resources, liabilities are its present obligations, and stockholders' equity is the residual interest in the assets.

- 3. Explain how to measure the elements of a balance sheet.** There are five alternatives for measuring the elements (assets and liabilities) of a balance sheet. These include: (1) historical cost/historical proceeds (2) current cost/current proceeds, (3) current market value, (4) net realizable value, and (5) present value. Alternatives (2) through (4) are ways of measuring the fair value of an element. Each of these alternatives is used under specific circumstances for measuring certain assets and liabilities.
- 4. Classify the assets of a balance sheet.** The assets of a balance sheet may be classified into five groups: (1) current assets, (2) long-term investments, (3) property, plant, and equipment, (4) intangible assets, and (5) other assets.
- 5. Classify the liabilities of a balance sheet.** The liabilities of a balance sheet may be classified into three groups: (1) current liabilities, (2) long-term liabilities, and (3) other liabilities.
- 6. Report the stockholders' equity of a balance sheet.** The stockholders' equity of a balance sheet consists of contributed capital (capital stock and additional paid-in capital), retained earnings, and accumulated other comprehensive income.
- 7. Prepare a statement of changes in stockholders' equity.** A statement of changes in stockholders' equity starts with the beginning balances of capital stock, additional paid-in capital, retained earnings, and accumulated other comprehensive income. It then reconciles these beginning balances to the ending balances by showing the changes (and reasons for the changes) in each of these items.
- 8. Understand the other disclosure issues for a balance sheet.** To help users understand the elements of its balance sheet (and other financial statements), a company also discloses useful information in the notes to the financial statements. This information includes a summary of the company's accounting policies, the fair value and risk of its financial instruments, any contingent liabilities and assets, any subsequent events, and any related party transactions. The company also includes comparative financial statements, all of which must be audited.
- 9. Describe the SEC integrated disclosures.** A company can satisfy certain SEC 10-K disclosure requirements by including an "integrated" set of disclosures in its annual report. The company must include comparative financial statements, selected financial information for a five-year period, a management's discussion and analysis (MD&A), and common stock market prices and dividends.
- 10. Explain the reporting techniques used in an annual report.** A company may use various reporting techniques in its annual report. It may use a *report form* or *account form* of balance sheet. It may combine amounts of certain elements, and may round the reported numbers. It may provide additional information in the notes to the financial statements, supporting schedules, or parenthetical notations.

## ANSWERS TO REAL REPORT QUESTIONS

### Real Report 4-1 Answers

- Below are the percentages of each type of inventory (calculated by dividing the type of inventory by total inventory for each respective year)
 

	<u>2004</u>	<u>2003</u>
Raw materials and supplies	26%	27%
Goods in process	30%	27%
Finished goods	44%	46%
- The reduction of finished goods inventory, coupled with the increase in the goods in process inventory, could be interpreted as a signal that Johnson & Johnson is expecting higher future demand and sales, and is increasing production to meet this forecast.

### Real Report 4-2 Answers

- Projects in progress represent 4.5% and 3.6% of the total cost of projects as of August 3, 2003, and August 1, 2004, respectively.
- This indicates that Campbell's capital expenditures on new projects have remained fairly steady and represent a small portion of its fixed assets.

### Real Report 4-3 Answers

- Kimberly Clark has access to a significant source of cash through revolving credit facilities (\$1.2 billion) which should be considered when evaluating the company's liquidity and financial flexibility. Additionally, the company, absent any refinancing of debt, will incur cash outflows of approximately \$1.2 billion within the next year relating to the settlement of debt (both current maturities of long-term debt and other current debt). Finally, information on the scheduled maturities of long-term debt for the next five years is provided.
- Interest expense (computed by multiplying the weighted average interest rate by the average debt outstanding) was approximately \$134.2 million.
- Assuming that the weighted average interest rate for 2005 remains the same as for 2004 and the average value of the notes and debentures for 2005 is equal to the value at December 31, 2004, interest expense relating to the notes and debentures is estimated to be \$133.3 million ( $\$2,309,800,000 \times 5.77\%$ ). These assumptions can be modified to take into account predicted economic activity (e.g., rising interest rates).

### Real Report 4-4 Answers

1. Users of financial statements need to understand the accounting methods used in the preparation of the financial statements to facilitate intercompany as well as intracompany comparisons. Because the use of different accounting methods can result in different valuations in the financial statements, the comparability and consistency of the information presented would be compromised if such disclosures were not made.
2. If the company had used accelerated depreciation instead of straight-line depreciation, the company would have recorded more depreciation expense than currently recorded. This additional expense would have resulted in lower income. Additionally, the book value of the com-

pany's assets (property, plant, and equipment) and equity (retained earnings) would be lower.

### Real Report 4-5 Answer

1. If Pinnacle Entertainment were to lose this litigation, the company would lose approval for the docking site of its casino on the St. Louis riverfront. The loss of this docking site could result in (1) a write-down of assets that make up the docking site (since the assets' future benefits are certainly in doubt); (2) the relocation of the casino to another location at considerable cost; and (3) the loss of income due to the inability to operate the casino until an approved location is found.

## QUESTIONS

- Q4-1** What are the major financial statements of a company and what do they show?
- Q4-2** What does a company's financial position include?
- Q4-3** What are two purposes of a company's balance sheet?
- Q4-4** Define liquidity, financial flexibility, and operating capability.
- Q4-5** What is financial capital? Why is capital maintenance important?
- Q4-6** What does "recognition" mean in accounting?
- Q4-7** Define an asset. What are the three characteristics of an asset?
- Q4-8** Define a liability. What are the three characteristics of a liability?
- Q4-9** What is stockholders' equity?
- Q4-10** Identify the five alternatives for measuring (valuing) assets. What is the fair value of an asset? Which valuation method is usually used in a company's balance sheet?
- Q4-11** List the major sections (and the components of each section) of a company's balance sheet.
- Q4-12** How are current assets defined and what are the major items that may be included in current assets? How are current liabilities defined? Give three examples of such liabilities.
- Q4-13** Define a company's operating cycle. How does working capital relate to this cycle? How is working capital computed?
- Q4-14** What items are classified as (a) long-term investments, (b) property, plant, and equipment, and (c) intangible assets?
- Q4-15** What items are classified as (a) long-term liabilities and (b) other liabilities?
- Q4-16** What is a bond? Give an illustration of how bonds payable would be disclosed on a company's balance sheet.
- Q4-17** Define (a) capital stock, (b) additional paid-in capital in excess of par, (c) treasury stock, (d) retained earnings, (e) deficit, and (f) accumulated other comprehensive income.
- Q4-18** What are investments by owners? Distributions to owners? In what statement do many companies report these items?
- Q4-19** What accounting policies are disclosed in the notes accompanying a company's financial statements? Why is this disclosure important?
- Q4-20** Give several examples of financial instruments and identify the required *disclosures* for a company's financial instruments.
- Q4-21** What is a loss contingency? What criteria have to be met for a company to accrue a loss contingency? If these criteria are not met, how does a company disclose a loss contingency?
- Q4-22** Why is it necessary for a company to disclose subsequent events? What kinds of subsequent events are disclosed by an adjustment to the company's financial statements and what kinds are disclosed in a note?
- Q4-23** What must a company disclose for related party transactions?
- Q4-24** Why are comparative financial statements important?
- Q4-25** What is an audit and why is the auditor's report an important item of information?

**Q4-26** Briefly describe the SEC "integrated" disclosures that most regulated companies include in their annual reports.

**Q4-27** Briefly list the format of a company's balance sheet under international accounting standards.

**Q4-28** What is the difference between the report form and the account form of the balance sheet?

**Q4-29** What alternative methods are used to disclose additional information not included in the accounts reported on a company's financial statements? Give examples of the types of information disclosed by each method.

**Q4-30** What factors should be considered when an accountant prepares and writes financial reporting notes?

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

**M4-1** APB Opinion No. 22, "Disclosure of Accounting Policies"

- Requires a description of every accounting policy followed by a reporting entity
- Provides a specific listing of all types of accounting policies that must be disclosed
- Requires disclosure of the format for the statement of cash flows
- Requires a description of all significant accounting policies to be included as an integral part of the financial statements

**M4-2** Which of the following contingencies should generally be accrued on the balance sheet when the occurrence of the contingent event is reasonably possible and its amount can be reasonably estimated?

	Gain Contingency	Loss Contingency
a.	Yes	Yes
b.	Yes	No
c.	No	Yes
d.	No	No

**M4-3** A donated fixed asset (from a governmental unit) for which the fair value has been determined should be recorded as a debit to fixed assets and a credit to

- Unrealized capital
- Retained earnings
- Deferred income
- Other income

**M4-4** On October 2, 2005, a company borrowed cash and signed a 3-year interest-bearing note on which both the principal and interest are payable on October 2, 2008. At December 31, 2007 the accrued interest should

- Be reported on the balance sheet as a current liability
- Be reported on the balance sheet as a noncurrent liability
- Be reported on the balance sheet as part of long-term notes payable
- Not be reported on the balance sheet as a liability

**M4-5** Financial statements that are expressed assuming a stable monetary unit are

- General-price-level financial statements
- Historical-dollar financial statements

- Current-value financial statements
- Fair-value financial statements

**M4-6** Rent revenue collected one month in advance should be accounted for as

- Revenue in the month collected
- A current liability
- A separate item in stockholders' equity
- An accrued liability

**M4-7** Which of the following should be disclosed in the Summary of Significant Accounting Policies?

- Rent expense amount
- Maturity dates of long-term debt
- Methods of amortizing intangibles
- Composition of plant assets

**M4-8** A company receives an advance payment for special-order goods to be manufactured and delivered within six months. The advance payment should be reported on the company's balance sheet as a

- Deferred charge
- Contra-asset account
- Current liability
- Noncurrent liability

**M4-9** The FASB has identified five alternatives for measuring balance sheet elements. Which of the following alternatives may be used?

	Net Realizable Value	Present Value
a.	No	No
b.	No	Yes
c.	Yes	No
d.	Yes	Yes

**M4-10** The balance sheet provides information about each of the following items, except

- Operating capability of entity
- Results of entity's operations
- Entity's liquidity
- Financial flexibility of entity

## EXERCISES

**E4-1** *Current Assets* Listed here are certain accounts of the Jenkins Company at the end of 2007:

<u>Account</u>	<u>Debit (Credit)</u>
Land	\$12,000
Prepaid insurance	1,530
Cash on hand	1,120
Notes receivable (due 2010)	4,300
Cash in bank	5,400
Allowance for doubtful accounts	(1,100)
Marketable securities (short-term)	3,380
Accumulated depreciation	(8,700)
Accounts receivable	15,600
Office supplies	970
Buildings	27,200
Inventory	19,700

### Required

Prepare the current asset section of Jenkins' balance sheet.

**E4-2** *Plant and Equipment* Your analysis of the fixed asset accounts at the end of 2007 for the Moen Corporation reveals the following information:

- The company owns two tracts of land. The first, which cost \$18,000, is being held as a future building site. It has a current market value of \$20,000. The second, which cost \$19,000, was purchased 10 years ago. On this site were built the current office and factory buildings. The land has a current market value of \$56,000.
- The company owns two buildings. The office building and the factory building were both built 10 years ago at a cost of \$50,000 and \$120,000, respectively. At that time each was expected to have a life of 30 years, and a residual value of 10% of original cost. They are being depreciated on a straight-line basis.
- The company owns factory machinery with a total cost of \$51,000 and accumulated depreciation of \$35,300. Included in factory machinery is one machine that cost \$7,000 and has accumulated depreciation of \$4,200. This machine is being held for resale and is not being used in operations.
- The company owns office equipment that cost \$14,500 and has a book value of \$6,300. It owns office furniture that cost \$17,900 and has a book value of \$11,400.

### Required

Prepare the property, plant, and equipment section of Moen's 2007 ending balance sheet.

**E4-3** *Stockholders' Equity* The following are several accounts of the Graf Corporation at the end of 2007:

<u>Account</u>	<u>Credit Balance</u>
Common stock, \$10 par	\$ 47,100
Bonds payable (due 2014)	126,000
Premium on preferred stock	39,600
Retained earnings	209,000
Premium on bonds payable	12,300
Unearned rent	4,800
Preferred stock, \$100 par	65,400
Premium on common stock	53,900
Unfunded accrued pension cost	18,400
Treasury stock (cost)	(7,600) debit
Accumulated other comprehensive income	8,200

### Required

Prepare the stockholders' equity section of Graf's 2007 ending balance sheet.

**E4-4** *Classifications on Balance Sheet* A balance sheet may contain the following major sections:

- |                          |                                   |
|--------------------------|-----------------------------------|
| A. Current assets        | C. Property, plant, and equipment |
| B. Long-term investments | D. Intangible assets              |

- |                          |   |
|--------------------------|---|
| E. Other assets          | I. Contributed capital                    |
| F. Current liabilities   | J. Retained earnings                      |
| G. Long-term liabilities | K. Accumulated other comprehensive income |
| H. Other liabilities     |   |

**Required**

The following is a list of fifteen accounts. Using the letters A through K, indicate in which section of the balance sheet each account would most likely be classified. Place a check mark (✓) beside each item that is a contra account. If an account cannot be classified in any of the preceding sections, indicate with an X and explain.

- |  |  |
|--|--|
| _____ 1. Temporary investments in marketable securities                | _____ 8. Preferred stock   |
| _____ 2. Discount on bonds payable (bonds due in 5 years)              | _____ 9. Unearned rent (to be earned within next 6 months)                   |
| _____ 3. Additional paid-in capital on common stock                    | _____ 10. Accrued pension cost   |
| _____ 4. Accounts receivable   | _____ 11. Trademarks   |
| _____ 5. Notes payable (due in 5 years)                                | _____ 12. Deficit  |
| _____ 6. Patents (net)   | _____ 13. Salaries payable   |
| _____ 7. Unrealized decrease in value of available-for-sale securities | _____ 14. Land   |
|  | _____ 15. Investment in Ace Company preferred stock (to be held for 3 years) |

**E4-5 Classifications on Balance Sheet** The balance sheet contains the following major sections:

- |                                   |   |
|-----------------------------------|---|
| A. Current assets                 | G. Long-term liabilities                  |
| B. Long-term investments          | H. Other liabilities                      |
| C. Property, plant, and equipment | I. Contributed capital                    |
| D. Intangible assets              | J. Retained earnings                      |
| E. Other assets                   | K. Accumulated other comprehensive income |
| F. Current liabilities            |   |

**Required**

The following is a list of several accounts. Using the letters A through K, indicate in which section of the balance sheet each of the accounts would be classified. Place a check mark (✓) beside each item that is a contra account. If an account cannot be classified in any of the preceding sections, indicate with an X and explain.

- |  |   |
|--|---|
| _____ 1. Cash                                  | _____ 12. Allowance for doubtful accounts                               |
| _____ 2. Bonds payable (due in 8 years)        | _____ 13. Notes receivable (due in 3 years)                             |
| _____ 3. Machinery                             | _____ 14. Property taxes payable  |
| _____ 4. Deficit                               | _____ 15. Deferred taxes payable  |
| _____ 5. Unexpired insurance                   | _____ 16. Premium on preferred stock                                    |
| _____ 6. Franchise (net)                       | _____ 17. Premium on bonds payable (due in 8 years)                     |
| _____ 7. Fund to retire preferred stock        | _____ 18. Work in process   |
| _____ 8. Current portion of mortgage payable   | _____ 19. Common stock, \$1 par   |
| _____ 9. Accumulated depreciation              | _____ 20. Land  |
| _____ 10. Copyrights                           | _____ 21. Treasury stock (at cost)                                      |
| _____ 11. Investment in held-to-maturity bonds | _____ 22. Unrealized increase in value of available-for-sale securities |

**E4-6 Balance Sheet** The balance sheet accounts and amounts of the Baggett Company as of December 31, 2007 are shown in random order as follows:

Account	Debit (Credit)	Account	Debit (Credit)
Income taxes payable	\$ (3,800)	Premium on preferred stock	\$ (7,900)
Prepaid items	1,800	Allowance for doubtful accounts	(1,600)
Premium on common stock	(9,300)	Bonds payable (due 2017)	(23,000)
Land	12,200	Buildings	57,400
Notes payable (due 2010)	(6,000)	Sinking fund to retire bonds payable	5,000
Notes receivable (due 2009)	16,400	Advances from customers (long-term)	(2,600)
Accounts receivable	12,600	Cash	4,300
Premium on bonds payable	(1,400)	Accumulated depreciation: equipment	(9,700)

Account	Debit (Credit)	Account	Debit (Credit)
Accounts payable	(13,100)	Retained earnings	(18,300)
Inventory	7,400	Preferred stock, \$100 par	(18,600)
Accumulated depreciation: buildings	(21,000)	Wages payable	(1,400)
Patents (net)	4,600	Common stock, \$10 par	(12,700)
Equipment	28,700		

**Required**

1. Prepare a December 31, 2007 balance sheet for the Baggett Company.
2. Compute the debt ratio.

**E4-7 Balance Sheet** The December 31, 2007 balance sheet accounts of the Hitt Company are shown here in alphabetical order:

Accounts payable	\$ 22,400	Current taxes payable	\$ 10,400
Accounts receivable	21,500	Discount on bonds payable	6,900
Accumulated depreciation: buildings	53,000	Equipment	72,400
Accumulated depreciation: equipment	35,100	Inventory	37,200
Additional paid-in capital on common stock	24,000	Land	30,000
Additional paid-in capital on preferred stock	11,500	Marketable securities (short-term)	6,100
Allowance for doubtful accounts	800	Patents (net)	9,800
Bonds payable (due 2021)	77,000	Preferred stock, \$100 par	21,000
Buildings	144,000	Retained earnings	46,200
Cash	2,900	Salaries payable	2,000
Common stock, \$10 par	30,000	Trademarks	3,700
		Unrealized increase in value of marketable securities	1,100

**Required**

1. Prepare the December 31, 2007 balance sheet of the Hitt Company.
2. Compute the working capital and the current ratio.

**E4-8 Balance Sheet Calculations** The balance sheet information at the end of 2007 and 2008 for the Dawson Company is as follows:

	2007	2008
Current assets	\$ (a)	\$25,000
Long-term liabilities	(b)	34,900
Total contributed capital	(c)	(g)
Long-term investments	19,200	(h)
Retained earnings	50,000	60,000
Total liabilities	(d)	(i)
Intangible assets	10,400	9,200
Current liabilities	14,500	12,300
Capital stock, \$5 par	(e)	20,000
Total assets	142,200	(j)
Additional paid-in capital	15,000	(k)
Property, plant, and equipment (net)	85,700	92,800
Accumulated other comprehensive income	6,900	7,000
Total stockholders' equity	(f)	(l)

*Additional information:* The company did not issue any common stock during 2008.

**Required**

Fill in the blanks labeled (a) through (l). All the necessary information is provided. (*Hint:* It is not necessary to calculate your answers in alphabetical order.)

**E4-9 Balance Sheet Calculations** The balance sheet information of the Fermer Company at the end of 2007 and 2008 is as follows:

	2007	2008
Total stockholders' equity	\$ (1)	\$100,700
Accumulated other comprehensive income	4,800	5,000
Current liabilities	(2)	9,800
Intangible assets	12,600	12,000
Property, plant, and equipment (net)	(3)	87,500
Current assets	19,100	(8)
Total contributed capital	51,000	(9)
Long-term liabilities	(4)	30,200
Retained earnings	40,900	(10)
Total assets	(5)	(11)
Common stock, \$10 par	(6)	(12)
Working capital	9,900	10,200
Additional paid-in capital	(7)	36,000
Long-term investments	23,700	(13)
Total liabilities	38,100	(14)

*Additional information:* At the end of 2007, additional paid-in capital is twice the amount of capital stock. In 2008, the company issued (sold) 100 shares of common stock.

#### Required

Fill in the blanks numbered (1) through (14). All the necessary information is provided. (*Hint:* It is not necessary to calculate your answers in numerical order.)

**E4-10 Correction of Balance Sheet** On December 31, 2007, the Stevens Company bookkeeper prepared the following erroneously classified balance sheet:

STEVENS COMPANY			
Balance Sheet			
For Year Ended December 31, 2007			
Current Assets		Current Liabilities	
Inventory	\$ 6,000	Accounts payable	\$ 9,900
Accounts receivable	5,900	Allowance for doubtful accounts	800
Cash	2,300	Salaries payable	1,500
Treasury stock (at cost)	3,300	Taxes payable	2,500
Long-Term Investments		Long-Term Liabilities	
Temporary investments in marketable securities	3,200	Bonds payable (due 2014)	11,000
Investment in held-to-maturity bonds	10,000	Unearned rent (for 3 months)	900
Plant and Equipment		Owners' Equity	
Land	8,100	Retained earnings	24,200
Office supplies	800	Accumulated depreciation on buildings and equipment	9,200
Buildings and equipment	35,600	Premium on common stock	10,400
Intangibles		Common stock, \$10 par	12,000
Patents (net)	5,000	Total Credits	<u>\$82,400</u>
Prepaid insurance (for 6 months)	1,200		
Discount on bonds payable	1,000		
Total Assets	<u>\$82,400</u>		

#### Required

You determine that the account balances listed on the balance sheet are correct but, in certain cases, incorrectly classified. Prepare a properly classified balance sheet for the Stevens Company as of December 31, 2007.

**E4-11** *Changes in Stockholders' Equity* On January 1, 2007 the Powder Company listed the following stockholders' equity section of its balance sheet:

Contributed Capital	
Preferred stock, \$100 par	\$ 92,800
Common stock, \$5 par	37,400
Additional paid-in capital on preferred stock	21,500
Additional paid-in capital on common stock	<u>58,700</u>
Total contributed capital	\$ 210,400
Retained Earnings	<u>185,700</u>
Total Stockholders' Equity	<u>\$396,100</u>

During 2007, the following transactions and events occurred and were properly recorded:

1. The company issued 1,800 shares of common stock at \$13 per share.
2. The company issued 340 shares of preferred stock at \$130 per share.
3. The company earned net income of \$38,950.
4. The company paid a \$7 per share dividend on the preferred stock and a \$1 per share dividend on the common stock outstanding at the end of 2007.

**Required** 

Prepare a statement of changes in stockholders' equity of the Powder Company for 2007. (Include retained earnings.)

**E4-12** *Changes in Stockholders' Equity* On January 1, 2007 the Osborne Company reported the following alphabetical list of stockholders' equity items:

Additional paid-in capital on common stock	\$170,000
Additional paid-in capital on preferred stock	12,000
Common stock, \$2 par	80,000
Preferred stock, \$100 par	60,000
Retained earnings	209,000

During 2007, the company sold 3,000 shares of common stock for \$10 per share and 500 shares of preferred stock for \$125 per share. It also earned income of \$99,000 and paid dividends of \$8 per share on the preferred stock and \$1.50 per share on the common stock outstanding at the end of 2007.

**Required**

Prepare a statement of changes in stockholders' equity of the Osborne Company for 2007. (Include retained earnings.)

## PROBLEMS

**P4-1** *Classifications on Balance Sheet* The current balance sheet of Day Company contains the following major sections:

- |                                   |   |
|-----------------------------------|---|
| A. Current assets                 | G. Long-term liabilities                  |
| B. Long-term investments          | H. Other liabilities                      |
| C. Property, plant, and equipment | I. Contributed capital                    |
| D. Intangible assets              | J. Retained earnings                      |
| E. Other assets                   | K. Accumulated other comprehensive income |
| F. Current liabilities            |   |

The following is a list of 37 accounts. Using the letters A through K, indicate in which section each account would most likely be classified. Place a check mark (✓) beside each item that is a contra account. If an account cannot be classified in any of the preceding sections, indicate with an X and explain.

### Required

Prepare a balance sheet (without amounts) in proper format for the Oliver Manufacturing Company.

**P4-3 Balance Sheet** The following is an alphabetical list of the December 31, 2007 balance sheet accounts and amounts for the Green Manufacturing Company:

Accounts payable	\$20,900	Accumulated depreciation: machinery and equipment	30,000
Accounts receivable	15,300	Allowance for doubtful accounts	1,000
Accrued pension cost	13,300	Bond sinking fund	7,700
Accumulated depreciation: buildings	32,400		

Bonds payable (due 2021)	29,000	Marketable securities (short-term)	8,400
Buildings	92,500	Notes payable (short-term)	5,000
Cash	7,200	Patents (net)	8,600
Common stock, \$10 par	44,100	Preferred stock, \$100 par	30,000
Deferred taxes payable	2,800	Premium on common stock	16,300
Discount on bonds payable	2,500	Premium on preferred stock	7,000
Dividends payable	5,600	Prepaid insurance	2,600
Finished goods	23,800	Raw materials	10,100
Income taxes payable	8,900	Retained earnings	28,100
Interest payable	500	Unearned rent	5,000
Investment in available-for-sale stock	16,400	Unrealized increase in value of available-	
Land	17,000	for-sale stock	2,000
Machinery and equipment	57,800	Wages payable	2,700
		Work in process	14,700

**Required**

Prepare a properly classified balance sheet for the Green Manufacturing Company on December 31, 2007. List the additional parenthetical or note disclosures (if any) that should be made for each item. Compute the working capital and the current ratio.

**P4-4 Balance Sheet** The following is a list (in random order) of the December 31, 2007 balance sheet accounts of the Midwest Company:

Additional paid-in capital on preferred stock	\$ 1,600	Accounts payable	\$16,500
Accounts receivable	13,800	Prepaid insurance	900
Dividends payable	1,800	Discount on bonds payable	2,000
Buildings	50,000	Common stock, \$10 par	15,000
Bonds payable (due 2013)	29,000	Equipment	29,000
Retained earnings	25,800	Allowance for doubtful accounts	700
Office supplies	1,900	Preferred stock, \$50 par	10,000
Current income taxes payable	4,200	Accumulated depreciation: buildings	12,400
Accumulated depreciation: equipment	8,300	Current interest payable	2,900
Patents (net)	2,400	Investment in held-to-maturity bonds	9,000
Notes payable (due January 1, 2010)	17,000	Cash	8,200
Inventory	24,400	Treasury stock (at cost)	1,500
Additional paid-in capital on common stock	7,700	Accrued wages	3,700
Sinking fund for bond retirement	4,000	Land	9,500

**Required**

Prepare a properly classified balance sheet for the Midwest Company on December 31, 2007.

**P4-5 Balance Sheet from Adjusted Trial Balance** The following is the alphabetical adjusted trial balance of the Meadows Company on December 31, 2007:

	Debits	Credits
Accounts payable		\$ 9,800
Accounts receivable	\$ 18,000	
Accrued payables		6,500
Accumulated depreciation		44,000
Additional paid-in capital		50,600
Cash	7,900	
Common stock, \$5 par		29,600
Cost of goods sold	175,500	
Current portion of long-term debt		6,200
Deferred taxes payable		12,500
Dividends distributed	7,000	
General expenses	27,560	
Income tax expense	12,340	

	Debits	Credits
Income taxes payable		7,500
Interest expense	4,300	
Inventories	32,000	
Investment in held-to-maturity bonds	36,000	
Long-term debt		56,300
Long-term receivables	38,600	
Marketable securities (short-term)	10,100	
Patents (net)	13,000	
Prepaid insurance	5,000	
Property, plant, and equipment	148,000	
Retained earnings, 1/1/07		64,800
Sales		278,000
Sales returns	8,000	
Selling expenses	21,500	
Unrealized decrease in value of available- for-sale securities	1,000	
	<u>\$565,800</u>	<u>\$565,800</u>

**Required**

Prepare the December 31, 2007 balance sheet of the Meadows Company. Compute the debt ratio.

**P4-6 Balance Sheet and Notes** Listed here in random order are the balance sheet accounts and related ending balances of the Eubanks Company as of December 31, 2007:

Income taxes payable	\$ 24,700	Temporary investments	\$19,100
Cash surrender value of life insurance	8,900	Bonds payable	80,000
Preferred stock	40,000	Additional paid-in capital on common stock	30,300
Premium on bonds payable	4,800	Inventories	98,500
Cash	11,600	Accounts receivable	32,300
Property, plant, and equipment (net)	229,300	Patents (net)	18,200
Accounts payable	58,000	Investment in bonds	25,000
Common stock	62,800	Additional paid-in capital on preferred stock	23,400
Retained earnings	123,400	Miscellaneous current payables	6,200
Land held for building site	19,500	Estimated liability for product warranties	7,300
Allowance for doubtful accounts	1,500		

*Additional information:*

- The company uses control accounts for inventories and property, plant, and equipment and lists the latter at its book value.
- The straight-line method is used to depreciate buildings, machinery, and equipment, based upon their cost and estimated residual values and lives. A breakdown of property, plant, and equipment shows the following: land at a cost of \$32,000, buildings at a cost of \$182,400 and a book value of \$120,200, machinery at a cost of \$63,900 and related accumulated depreciation of \$18,600, and equipment (40% depreciated) at a cost of \$53,000.
- Patents are amortized on a straight-line basis directly to the patent account.
- Inventories are listed at the lower of cost or market value using an average cost. The inventories include raw materials \$22,200, work in process \$34,700, and finished goods \$41,600.
- Common stock has a \$10 par value per share, 12,000 shares are authorized, 6,280 shares have been issued.
- Preferred stock has a \$100 par value per share, 1,000 shares are authorized, 400 shares have been issued.
- The investment in bonds is carried at the original cost, which is the face value, and is being held to maturity.
- Temporary investments in marketable securities were purchased at year-end.
- The bonds payable mature on December 31, 2012.
- The company attaches a one-year warranty on all the products it sells.

**Required**

- Prepare the December 31, 2007 balance sheet of the Eubanks Company (including appropriate parenthetical notations).
- Prepare notes to accompany the balance sheet that itemize company accounting policies, inventories, and property, plant, and equipment.
- Compute the current ratio. Which current assets would you classify as *liquid* and which as *separable* according to the FASB's conceptual guidelines? Why might these classifications be useful?

**P4-7 Comprehensive: Balance Sheet, Schedules, and Notes** The following is an alphabetical listing of the balance sheet accounts and account balances of the Blazer Company on December 31, 2007:

Accounts payable	\$ 44,200	Income taxes payable	\$ 19,700
Accounts receivable	37,100	Inventory	85,300
Accumulated depreciation	109,300	Investment in affiliate	30,000
Additional paid-in capital on common stock	20,000	Long-term liabilities (book value)	91,000
Additional paid-in capital on preferred stock	3,200	Miscellaneous current payables	6,800
Allowance for doubtful accounts	1,600	Notes receivable	17,000
Bond sinking fund	12,500	Preferred stock	32,000
Cash	13,800	Property and equipment	296,700
Common stock	80,000	Retained earnings	84,600

*Additional information:*

- The company uses a control account for property and equipment, accumulated depreciation, and for long-term liabilities. The latter account is listed at its book value.
- The straight-line method is used to depreciate property and equipment based upon cost, estimated residual value, and estimated life. The costs of the assets in this account are: land \$29,500, buildings \$164,600, store fixtures \$72,600, and office equipment \$30,000.
- The accumulated depreciation breakdown is as follows: buildings \$54,600, store fixtures \$37,400, and office equipment \$17,300.
- The long-term debt includes 12%, \$36,000 face value bonds that mature on December 31, 2012 and have an unamortized bond discount of \$1,000; 11%, \$48,000 face value bonds that mature on December 31, 2016, have a premium on bonds payable of \$1,800, and whose retirement is being funded by a bond sinking fund; and a 13% note payable that has a face value of \$6,200 and matures on January 1, 2010.
- The noninterest-bearing note receivable matures on June 1, 2008.
- Inventory is listed at lower of cost or market; cost is determined on the basis of average cost.
- The investment in affiliate is carried at cost. The company has guaranteed the interest on 12%, \$50,000, 15-year bonds issued by this affiliate, the Jay Company.
- Common stock has a \$10 par value per share, 10,000 shares are authorized, and 1,000 shares were issued during 2007 at a price of \$13 per share, resulting in 8,000 shares issued at year-end.
- Preferred stock has a \$50 par value per share, 2,000 shares are authorized, and 140 shares were issued during 2007 at a price of \$55 per share, resulting in 640 shares issued at year-end.
- On January 15, 2008, before the December 31, 2007 balance sheet was issued, a building with a cost of \$20,000 and a book value of \$7,000 was totally destroyed. Insurance proceeds will amount to only \$5,000.
- Net income and dividends paid during the year were \$50,500 and \$21,000, respectively.

**Required** 

- Prepare the December 31, 2007 balance sheet (including appropriate parenthetical notations) of the Blazer Company.
- Prepare a statement of changes in stockholders' equity for 2007. (*Hint: Work back from the ending account balances.*)
- Prepare notes that itemize the balance sheet control accounts and those necessary to disclose any company accounting policies, contingent liabilities, and subsequent events.
- Compute the debt ratio at the end of 2007. What is your evaluation of this ratio if it was 39% at the end of 2006?

**P4-8 Corrections to Balance Sheet** The Cable Company prepared the following balance sheet:

CABLE COMPANY			
Balance Sheet For Year Ended December 31, 2007			
Working capital	\$ 22,800	Noncurrent liabilities	\$ 62,000
Other assets	<u>152,000</u>	Stockholders' equity	<u>112,800</u>
Total	<u>\$174,800</u>	Total	<u>\$174,800</u>

Your analysis of these accounts reveals the following information:

- |   |                  |                           |                  |
|---|------------------|---------------------------|------------------|
| 1. Working capital consists of:                   |                  | 2. Other assets include:  |                  |
| Land  | \$ 12,000        | Cash                      | \$ 12,300        |

|   | <u>\$ 22,800</u> |                           |                  |

3. Noncurrent liabilities consist of:		4. Stockholders' equity includes:	
Bonds payable (due 2017)	\$ 33,000	Accumulated depreciation:	
Allowance for doubtful accounts	1,400	buildings and equipment	\$ 40,000
Premium on preferred stock	2,600	Preferred stock, \$100 par	12,000
Common stock, \$5 par	25,000	Premium on common stock	15,600
	<u>\$ 62,000</u>	Retained earnings	40,000
		Accrued pension cost	6,500
		Unrealized decrease in value of available-for-sale securities	(1,300)
			<u>\$112,800</u>

**Required**

Based on your analysis, prepare a properly classified December 31, 2007 balance sheet for the Cable Company.

**P4-9** *Corrections to Balance Sheet* The Brandt Company presents the following December 31, 2007 balance sheet:

**BRANDT COMPANY**  
**Sheet of Balances**  
**For Year Ended December 31, 2007**

Current assets	\$ 44,300	Current liabilities	\$ 66,600
Long-term investments	13,600	Long-term liabilities	24,100
Property and equipment	123,500	Contributed capital	17,000
Intangible assets	7,700	Unrealized capital	22,500
Other assets	13,600	Retained earnings	72,500
Total assets	<u>\$202,700</u>	Total equities	<u>\$202,700</u>

The following information is also available:

- Current assets include cash \$3,800, accounts receivable \$18,500, notes receivable (maturity date July 1, 2009) \$10,000, and land \$12,000.
- Long-term investments include a \$4,600 investment in available-for-sale securities that is expected to be sold in 2008 and a \$9,000 investment in Dray Company bonds that are expected to be held until their December 31, 2016 maturity date.
- Property and equipment include buildings costing \$63,400, inventory costing \$30,500, and equipment costing \$29,600.
- Intangible assets include patents that cost \$8,200 and on which \$2,300 amortization has accumulated, and treasury stock that cost \$1,800.
- Other assets include prepaid insurance (which expires on November 30, 2008) \$2,900, sinking fund for bond retirement \$7,000, and trademarks that cost \$3,700 and are not impaired.
- Current liabilities include accounts payable \$19,400, bonds payable (maturity date December 31, 2018) \$40,000, and accrued income taxes payable \$7,200.
- Long-term liabilities include accrued wages \$4,100 and mortgage payable (which is due in five equal annual payments starting December 31, 2008) \$20,000.
- Contributed capital includes common stock (\$5 par) \$11,000 and preferred stock (\$100 par) \$6,000.
- Unrealized capital includes premium on bonds payable \$4,300, premium on preferred stock \$2,400, premium on common stock \$14,700, and unrealized increase in value of securities available for sale \$1,100.
- Retained earnings includes unrestricted retained earnings, \$37,800, allowance for doubtful accounts \$700, and accumulated depreciation on buildings and equipment of \$21,000 and \$13,000, respectively.

**Required** 

Based on the preceding information, prepare a properly classified December 31, 2007 balance sheet for the Brandt Company.

**P4-10** *Balance Sheet Calculations* The balance sheet information of the John Company at the end of 2007 and 2008 is as follows:

	2007	2008
Long-term liabilities	\$ (a)	\$ 33,100
Accumulated other comprehensive income	8,000	8,900
Working capital	17,900	19,800
Intangible assets	19,100	18,600

	2007	2008
Common stock, \$10 par	(b)	(i)
Total stockholders' equity	(c)	\$179,000
Accumulated depreciation	\$(37,500)	(48,600)
Total liabilities	51,900	(j)
Current assets	(d)	39,800
Retained earnings	83,300	(k)
Total contributed capital	66,700	(l)
Total assets	(e)	(m)
Additional paid-in capital	(f)	(n)
Long-term investments	40,100	(o)
Current liabilities	(g)	(p)
Property, plant, and equipment	(h)	180,000

*Additional information:* At the end of 2007, (a) the amount of long-term liabilities is twice the amount of current liabilities, and (b) there are 2,900 shares of common stock outstanding. During 2008, the company (a) issued 100 shares of common stock for \$25 per share, (b) earned net income of \$20,600, and (c) paid dividends of \$1 per share on the common stock outstanding at year-end.

### Required

Fill in the blanks lettered (a) through (p). All of the necessary information is provided. (*Hint:* It is not necessary to calculate your answers in alphabetical order.)

**P4-11** *Erroneous Balance Sheet* The Cutler Corporation prepared the following balance sheet:

CUTLER CORPORATION			
Balance Report For Year Ended December 31, 2007			
Current Assets		Current Liabilities	
Cash	\$ 6,300	Accounts payable	\$13,000
Accounts receivable	15,900	Accumulated depreciation: buildings	17,100
Inventory, at higher of cost or market (cost \$27,200)	28,000	Wages payable	3,000

Treasury stock (at cost)	1,400	Long-Term Liabilities	
Investment in D Company bonds (at book value)	7,300	Bonds payable	\$46,000
Marketable securities, short-term at market value	10,000	Less: Sinking fund to retire bonds	(6,000) 40,000
Property, Plant, and Equipment		Preferred stock, \$50 par	15,000
Land	11,300	Premium on preferred stock	5,100
Patents	\$8,000	Accumulated depreciation: equipment	7,000
Less: Accumulated amortization	(2,800) 5,200	Current taxes payable	9,600
Buildings	40,800	Owners' Equity:	
Equipment	19,000	Common stock, \$2 par	8,000
Intangibles		Unrealized gain on write-up of marketable securities to market value	1,300
Trademarks	5,700	Unrealized gain on write-up of inventory to market value	800
Other Assets		Retained earnings	16,000
Cash surrender value of life insurance	5,000	Allowance for doubtful accounts	700
Discount on bonds payable	3,900	Total Equities	\$159,800
Total Assets	<u>\$159,800</u>		

### Required

- Identify the errors made in the Cutler balance sheet.
- Prepare a corrected, properly classified balance sheet.

**P4-12 AICPA Adapted** *Complex Balance Sheet* Presented below is the unaudited balance sheet as of December 31, 2007, prepared by the bookkeeper of Zues Manufacturing Corporation.

**ZUES MANUFACTURING CORPORATION**  
**Balance Sheet For the Year Ended December 31, 2007**

Assets		Liabilities & Stockholders' Equity	
Cash	\$ 225,000	Accounts payable	\$ 133,800
Accounts receivable (net)	345,700	Mortgage payable	900,000
Inventories	560,000	Notes payable	500,000
Prepaid income taxes	40,000	Lawsuit liability	80,000
Investments	57,700	Income taxes payable	61,200
Land	450,000	Deferred tax liability	28,000
Building	1,750,000	Accumulated depreciation	420,000
Machinery and equipment	1,964,000	Total Liabilities	<u>\$2,123,000</u>
Goodwill	37,000	Common stock, \$50 par; 40,000	
Total Assets	<u>\$5,429,400</u>	shares issued	2,231,000
		Retained earnings	<u>1,075,400</u>
		Total Stockholders' Equity	<u>\$3,306,400</u>
		Total Liabilities and	
		Stockholders' Equity	<u>\$5,429,400</u>

Your firm has been engaged to perform an audit, during which the following data are found:

- Checks totaling \$14,000 in payment of accounts payable were mailed on December 31, 2007 but were not recorded until 2008. Late in December 2007, the bank returned a customer's \$2,000 check, marked "NSF," but no entry was made. Cash includes \$100,000 restricted for building purposes.
- Included in accounts receivable is a \$30,000 note due on December 31, 2010 from Zues' president.
- During 2007, Zues purchased 500 shares of common stock of a major corporation that supplies Zues with raw materials. Total cost of this stock was \$51,300, and market value on December 31, 2007 was \$47,000. The decline in market value is considered temporary. Zues plans to hold these shares indefinitely.
- Treasury stock was recorded at cost when Zues purchased 200 of its own shares for \$32 per share in May 2007. This amount is included in investments.
- On December 31, 2007, Zues borrowed \$500,000 from a bank in exchange for a 10% note payable, maturing December 31, 2012. Equal principal payments are due December 31 of each year, beginning in 2008. This note is collateralized by a \$250,000 tract of land acquired as a potential future building site, which is included in land.
- The mortgage payable requires \$50,000 principal payments, plus interest, at the end of each month. Payments were made on January 31 and February 28, 2008. The balance of this mortgage was due June 30, 2008. On March 1, 2008, prior to issuance of the audited financial statements, Zues consummated a noncancelable agreement with the lender to refinance this mortgage. The new terms require \$100,000 annual principal payments, plus interest, on February 28 of each year, beginning in 2009. The final payment is due February 28, 2016.
- The lawsuit liability will be paid in 2008.
- Of the total deferred tax liability, \$5,000 is considered a current liability.
- The current income tax expense reported in Zues' 2007 income statement was \$61,200.
- The company was authorized to issue 100,000 shares of \$50 par value common stock.

**Required**

Prepare a corrected classified balance sheet as of December 31, 2007. This financial statement should include a proper heading, format, and necessary descriptions.

**P4-13 Changes in Stockholders' Equity** On January 1, 2007 the Knox Company showed the following alphabetical list of stockholders' equity balances:

Additional paid-in capital on common stock	\$130,000
Additional paid-in capital on preferred stock	6,000
Common stock, \$10 par	100,000
Preferred stock, \$100 par	50,000
Retained earnings	224,000

During 2007, the following events occurred and were properly recorded by the company:

- The company purchased an investment in available-for-sale securities. At year-end the market value of the securities had increased by \$9,000.
- The company issued 2,000 shares of common stock for \$25 per share.

3. The company issued 110 shares of preferred stock for \$116 per share.
4. The company reacquired 400 shares of its common stock as treasury stock at a cost of \$26 per share. (*Hint:* Record the reacquisition cost in a Treasury Stock account.)
5. The company earned net income of \$57,000.
6. The company paid a \$7 per share dividend on the preferred stock and a \$1.25 per share dividend on the common stock outstanding at the end of 2007 (treasury stock is not entitled to dividends).

#### Required

Prepare a statement of changes in stockholders' equity for 2007. (Include retained earnings.)

**P4-14 Analyzing Coca-Cola's Balance Sheet Disclosures** Review the financial statements and related notes of the Coca-Cola Company in Appendix A.

#### Required

Answer the following questions. (*Note:* You do not need to make any calculations. All answers may be found in the financial report.) Indicate on what page of the annual report you located the answer.

1. What was the amount of the current assets on December 31, 2004?
2. What was the amount in the allowance for doubtful accounts on December 31, 2004?
3. What is the par value of the company's common stock? How many shares had been issued at the end of 2004?
4. What was the total amount of inventories on December 31, 2004? What were the principal categories of inventory on this date?
5. What was the long-term debt on December 31, 2004? Of this total, how much was for the 5¾%, U.S. dollar notes due 2011?
6. What was the allowance for depreciation on December 31, 2004? What method does the company use to depreciate its property, plant, and equipment?
7. What was the amount of accounts payable and accrued expenses on December 31, 2004? How much was for accrued marketing expenses?
8. What inventory costing method was used for most inventories in 2004?
9. What was the reinvested (retained) earnings on December 31, 2004?
10. What was the total property, plant, and equipment before and after allowance for depreciation on December 31, 2004?
11. What were the total assets on December 31, 2004?
12. What were the current liabilities on December 31, 2004?
13. What were the number of shares and cost of the treasury stock held by the company on December 31, 2004?
14. What was the amount of marketable securities on December 31, 2004? What was the unrealized gain (loss) on available for sale securities on December 31, 2004?
15. How much was the company contingently liable for guarantees of indebtedness owed by third parties on December 31, 2004?

## CASES

### COMMUNICATION

#### C4-1 Alternative Valuation Methods

A friend of yours who had a bookkeeping course in high school and who is currently a business major says, "I thought that assets were always reported at their historical cost on a company's balance sheet. Recently, however, I heard several accounting majors discussing 'alternative valuation methods' for measuring the value of assets. I know that historical cost is the exchange price paid for an asset, so I cannot understand how there can be any other 'value' for the asset."

#### Required

Write a short memo that identifies and briefly explains the valuation methods (other than historical cost) that a company could use to measure the value of an asset. For each valuation

method, include in your discussion examples of assets whose values are often reported based on the use of that method.

#### C4-2 Contingencies and Subsequent Events

The bookkeeper of a company you are auditing states, "Our balance sheet is dated December 31, the end of our accounting period. I don't understand loss contingencies and subsequent events. Also, I see no reason for disclosing these items on the company's balance sheet because they deal with events that might occur or have occurred *after* the balance sheet date."

#### Required

Write a short report to the bookkeeper that explains loss contingencies and subsequent events, as well as the importance of their disclosure on the company's balance sheet.

### C4-3 Securities and Exchange Commission Disclosures

**CMA Adapted** The Securities and Exchange Commission (SEC) has encouraged managements of public companies to disclose more information in the shareholders' annual report. As a consequence, a significant amount of the information required in the SEC's Form 10-K now appears in published annual reports.

At the same time, the SEC has made the annual financial reporting process simpler and more efficient by approving an integrated disclosure system.

#### Required

1. Identify the major classes of information that must be included in both the annual report to shareholders and Form 10-K filed with the SEC.
2. The integrated disclosure system is intended to simplify the annual reporting process with the SEC by expanding the ability to incorporate by reference.
  - a. Define what is meant by *incorporating by reference* and identify the documents that are involved when incorporating by reference.
  - b. Explain how the integrated disclosure system reduces managements' efforts in filing annual reports with the SEC.

- c. Explain the SEC's principal reasons for making the changes in the annual reporting process.
- d. Identify and explain potential problems the integrated disclosure system could have on the annual reporting process from the aspect of users of financial information.

### C4-4 Asset Valuation

It is the end of 2007 and you are an accountant for the Stone Company. During 2007, sales of the company's products slumped and the company's earnings are expected to be much less than those of 2006. The president comes to you with an idea. He says, "Our company's property, plant, and equipment cost \$300,000, and that is the amount we usually report on our balance sheet. However, I just had these assets appraised by an independent appraiser, and she says they are worth \$400,000. I think that the company should report the property, plant, and equipment at this amount on its December 31, 2007 balance sheet, and should report the \$100,000 increase in value as a gain on the 2007 income statement. If we use this approach, it will show how much our company is really worth and increase our earnings. This will make our stockholders happy. What do you think?"

#### Required

Prepare a written response to the president.

## CREATIVE AND CRITICAL THINKING

### C4-5 Valuation of Assets and Stock

A friend has come to you for advice. He states that he owns several shares of stock in a corporation. He has examined the most recent balance sheet of the corporation and has found that the common stock issued and outstanding totals 40,000 shares, and the market price per share is \$25 on the balance sheet date. He is sure that the balance sheet must be in error because, in his words, "the total assets are \$1,100,000 and this current value should be the same as the \$1,000,000 total value of the outstanding common stock."

#### Required

Explain to your friend how the "values" of the various assets of the corporation typically are measured and reported on its balance sheet, and how the "value" of the \$1,100,000 total assets is determined. Continue the discussion by explaining to your friend why the "values" of the assets and the stock are not the same.

### C4-6 Valuation of Assets

**AICPA Adapted** Valuation of assets is an important topic in accounting theory. Suggested valuation methods include the following:

- Historical cost (past purchase price)
- Historical cost adjusted to reflect general price-level changes
- Discounted cash flow (future exchange price)
- Market price (current selling price)
- Replacement cost (current purchase price)

#### Required

1. Why is the valuation of assets a significant issue?
2. Explain the basic theory underlying each of the valuation methods cited, including the effect on earnings. Do not discuss advantages and disadvantages of each method.

### C4-7 Analyzing Coca-Cola's Accounting Policies

A company must include a summary of its accounting policies in the notes to its financial statements. The Coca-Cola Company includes this summary as the first of its notes to the consolidated financial statements shown in Appendix A.

#### Required

1. Explain what is required to be disclosed about the accounting policies of a company.
2. Review the Coca-Cola Company's note on its accounting policies and answer the following questions:
  - a. When does the company recognize revenue?
  - b. What items are classified as cash equivalents?
  - c. How are inventories valued, and generally what inventory costing method(s) is used?
  - d. How are property, plant, and equipment stated, and what depreciation method is used?
  - e. How are trademarks and other intangible assets amortized?
  - f. How does the company account for production costs of print, radio, television, and other advertisements?

What was the amount of advertising and production costs included in prepaid expenses and other assets and noncurrent other assets as of December 31, 2004?

#### C4-8 Ethics and Accounts Receivable Adjustment

It is February 16, 2008 and you are auditing the Davenport Corporation's financial statements for 2007 (which will be issued in March, 2008). You read in the newspaper that Travis Corporation, a major customer of Davenport, is in financial difficulty. Included in Davenport's accounts receivable is \$50,000 (a material amount) owed to it by Travis. You approach Jim Davenport, president, with this information and suggest that a reduction of accounts receivable and recognition of a loss for 2007 might be appropriate. Jim replies, "Why should we make an adjustment? Ted Travis, the president of Travis Corporation, is a friend of mine; he will find a way to pay us, one way or another. Furthermore, this occurred in 2008, so let's wait and see what happens; we can always make an adjustment later this year. Our 2007 income and year-end working capital are not that high; our creditors and stockholders wouldn't stand for lower amounts than they already are."

#### C4-9 Ethics and Note Due from President

You are the accountant for Spaedy Company and are preparing the financial statements for 2007. Near the end of 2007, Spaedy Company loaned its president \$100,000 (a material amount) because she was having financial difficulties. The note was properly recorded as a note receivable by Spaedy Company. You are unsure of how to classify this note on the 2007 ending balance sheet and ask the president when the note is due. She replies, "We never really set a due date; I might repay it in 2008 or maybe in a couple of years when I get more financially secure. It would be best to classify this note as a current asset in the usual manner because that will increase our working capital and current ratio, which will make our creditors and stockholders happy."

#### Required

From financial reporting and ethical perspectives, what do you think of the president's suggestion?

## RESEARCH SIMULATION

### R4-1 Researching GAAP

#### Situation

You are the assistant accountant for Tyler Corporation. It is mid-January, 2008 and you are helping to prepare the Tyler Corporation's balance sheet for December 31, 2007. Tyler will publish this balance sheet on March 1, 2008, after the auditors have completed their work. Tyler has a \$100,000 note payable that was issued in 2006 and that is due March 6, 2008. On January 5, 2008, Tyler sold 2,000 shares of its \$10 par common stock for \$80,000. Its intent is to use these

proceeds (plus \$20,000 cash it already has on hand) to repay the note payable on March 6. The head accountant says "I'm not sure how to classify the \$100,000 note payable on the December 31, 2007 balance sheet. Check this out for me."

#### Directions

Research the related generally accepted accounting principles and prepare a short memo to the head accountant that explains how Tyler Corporation should report the \$100,000 note payable on its December 31, 2007 balance sheet.

## 5

# The Income Statement and Statement of Cash Flows

## OBJECTIVES

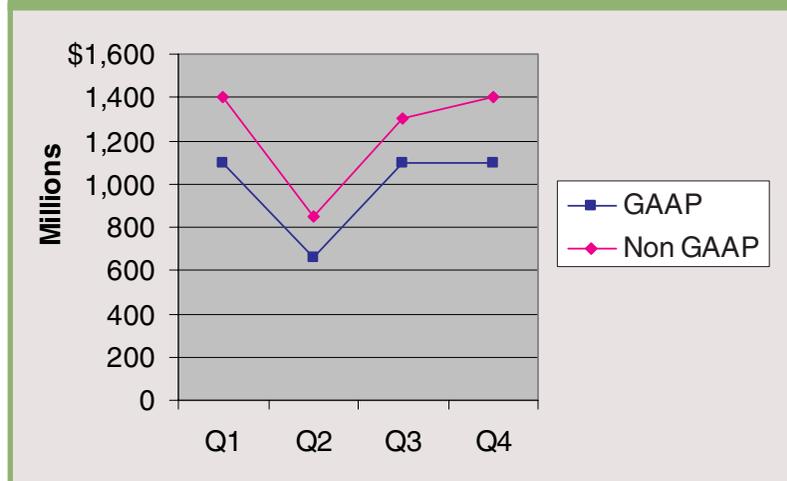

After reading this chapter, you will be able to:

- 1 Understand the concepts of income.
- 2 Explain the conceptual guidelines for reporting income.
- 3 Define the elements of an income statement.
- 4 Describe the major components of an income statement.
- 5 Compute income from continuing operations.
- 6 Report results from discontinued operations.
- 7 Identify extraordinary items.
- 8 Prepare a statement of retained earnings.
- 9 Report comprehensive income.
- 10 Explain the statement of cash flows.
- 11 Classify cash flows as operating, investing, or financing.

## A New Standard for Income?

*FASB Statement of Concepts No. 1* establishes the information on the income statement as the best indicator of company performance. However, many companies have increased their emphasis on non-GAAP performance measures. A recent earnings release by **Hewlett Packard** focuses on non-GAAP operating profit and earnings per share ahead of the GAAP operating profit and earnings per share. The graph below charts Hewlett Packard's non-GAAP and GAAP operating profit over the 2003 fiscal year.

HP: GAAP vs. Non-GAAP Operating Profit

Using names such as pro-forma earnings, normalized earnings, and earnings before interest, taxes, depreciation, and amortization (EBITDA), many companies argue that these alternative performance measures increase users' understanding of a company's past performance and its prospects for the future. The

Credit: Associated Press/AP

implication is that GAAP income is an inadequate measure of performance. However, because pro-forma measures typically exclude significant negative components of GAAP income, resulting in much higher pro-forma results, many view the use of non-GAAP measures as an attempt to put a positive spin on operating results.

Because of concern over the proliferation of alternative and inconsistent financial performance measures, the **FASB** has begun a project that may help alleviate the problem. The current project, "Financial Performance Reporting by Business Enterprises," does not specifically address pro-forma reporting. Instead it focuses on redesigning the income statement by providing standards for the display of information. Such a standard may reduce flexibility in how a company reports financial information but the FASB hopes that improving the presentation of GAAP-based performance measures will result in more meaningful and useful disclosures of a company's operating results.

## FOR FURTHER INVESTIGATION

For a discussion of pro-forma earnings and FASB's project to improve financial performance reporting, consult the Business & Company Resource Center (BCRC):

- "A Matter of Emphasis: Regulation G was Supposed to End the Abuses of Pro Forma Reporting. Has it Succeeded?" Alix Nyberg, *CFO, The Magazine for Senior Financial Executives*, 8756-7113, July 2004 v20 i9 p69(2).
- "Financial Performance Reporting: Striking a Balance Between Transparency and Simplicity." Colleen Sayther, *Financial Executive*, 0895-4186, Jan-Feb 2004 v20 i1 p6(1).

A company's **income statement** summarizes the results of its operations for the accounting period. This statement is alternatively referred to as a *statement of income*, *statement of earnings*, or *statement of operations*. The income statement and balance sheet are supported by a schedule entitled the *statement of retained earnings* (or simply the *retained earnings statement*), which serves as the link between the two statements. The operations of a company include routine ongoing activities, as well as activities that are infrequent or unusual. In addition, a company may divest itself of a major component of its operations, report extraordinary items, make changes in accounting principles, and make adjustments to prior periods' financial statements. We discuss how a company reports each of these items in this chapter as it relates to the company's income statement or its statement of retained earnings. We also discuss the alternative ways a company may report its comprehensive income in its financial statements. We also introduce the **statement of cash flows** in this chapter because of the relationship of operating, investing, and financing cash flows to different sections of the income statement and balance sheet. Before we do this, we first examine the concepts of income.

## CONCEPTS OF INCOME

1 Understand the concepts of income.

Accountants and economists have long debated what "income" is and how it should be measured. One *concept* of income is that of capital maintenance; a useful way to *measure* income is by using the transactional approach.

### Capital Maintenance Concept

The capital maintenance concept focuses upon the capital, or net assets (assets minus liabilities), of the corporation. Under this concept, a corporation's income for a period of time is the amount that it may pay to stockholders during that period and still be as well off at the end of the period as it was at the beginning.<sup>1</sup> In other words, **capital must be maintained before a corporation earns income on that capital**. Although capital may be thought of as financial capital or physical capital, the FASB uses a financial capital maintenance concept. To use this concept, the beginning and ending capital (that is, the net assets) must be compared after adjusting for any additional investments or disinvestments during the period. The resulting difference is the corporation's income. Given this definition, accountants and economists probably would agree on the total income that a corporation earned over its entire life. This lifetime income would be computed by comparing the total proceeds received from the liquidation of the net assets at the end of the life with the capital invested at the beginning of the life, adjusted for any additional investments or withdrawals. Here there is certainty regarding the value of the net assets at the two points in time.

However, **external (and internal) users need income information on a more timely basis** (for example, on an annual basis). Also, there is more uncertainty about the value of the net assets that have not been liquidated at the end of such a shorter time period. For a shorter time period the values of a company's assets and liabilities at the beginning and end of the period may be measured in several ways. For a particular corporation these might include use of (1) the historical cost, (2) the current cost, (3) the current market value, (4) the net realizable value, or (5) the present value of future cash flows. After measuring the values of the assets and liabilities at the two points in time using one of these methods, corporate income can be computed as the difference between the beginning and ending net assets (after any adjustments for additional investments or disinvestments). Many accountants and economists have advocated a particular valuation concept and

1. S. S. Alexander, "Income Measurement in a Dynamic Economy," *Five Monographs on Business Income* (New York: AICPA Study Group on Business Income, 1950), p. 15.

methodology.<sup>2</sup> (A thorough discussion of the conceptual merits of these alternatives is an appropriate topic for an accounting theory book.)

We provide a brief example of the capital maintenance approach to determining corporate income here, using the historical cost method of valuing net assets. Assume that a corporation has net assets of \$50,000 at the beginning and \$90,000 at the end of the year, and that no additional investments or withdrawals were made. Based upon a comparison of the ending and the beginning net assets, the corporation could pay out \$40,000 to stockholders and still be as well off at year-end. This \$40,000 is the corporation's income for the year, using the capital maintenance concept *based on historical costs*. To illustrate further, assume that a corporation has beginning net assets of \$45,000 and ending net assets of \$80,000. Also assume the stockholders made an additional capital investment of \$10,000 during the year. The total income of the corporation for the year is \$25,000 computed as follows:

Ending net assets	\$80,000
Less: Additional investment	(10,000)
Ending net assets excluding additional investments	\$70,000
Less: Beginning net assets	(45,000)
Total income for the year	<u>\$25,000</u>

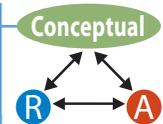

Unfortunately, in either of the two examples, **the corporation's total income is not very useful to various user groups**. The total income includes all amounts affecting net assets, whether they relate to usual or unusual, to extraordinary or ordinary events. But the total income is just that, a total. **The corporation's total income does not show a breakdown that identifies the causal relationships and operating activities** that may be helpful to a specific user group. This specific information is shown under the transactional approach to income measurement.

### Transactional Approach

As we noted in Chapter 2, an objective of financial reporting is to provide information that is useful to investors, creditors, and other external user groups to evaluate the amounts, timing, and uncertainty of the future net cash inflows for a company. A derived specific objective is to **provide information about a company's comprehensive income and its components**. That is, user groups are interested in the resources obtained from and the resources given up for ongoing operations, discontinued operations, and unusual and/or infrequent activities. Accountants are also concerned with developing reliable (verifiable) evidence of the company's income-producing and other business activities reported in its financial statements.

As a result, a transactional approach to income measurement has evolved. Generally, **in the transactional approach, a company records its net assets at their historical cost, and it does not record changes in the assets and liabilities unless a transaction, event, or circumstance has occurred that provides reliable evidence of a change in value**. The transactional approach uses the accrual basis of accounting. **In accrual accounting, a company records the financial effects of transactions and other events and circumstances in the periods during which they occur rather than only in the periods in which it receives or pays cash**. In the transactional approach certain changes in values of the specific assets or liabilities are associated with the earning activities and are included in the company's income.

The transactional approach to income measurement is used in accounting today. It is consistent with the traditional capital maintenance concept because the income represents

2. See, for instance, E. O. Edwards and P. W. Bell, *The Theory and Measurement of Business Income* (Berkeley: University of California Press, 1970).

Credit: ©Getty Images/PhotoDisc

the difference between the beginning and ending adjusted net assets on an historical cost basis. However, the **accrual-based transactional approach to income measurement** is more informative because it **relates (matches) the accomplishments and the efforts** so that the reported income measures the company's earnings activities.<sup>3</sup> The FASB has developed the concept of **comprehensive income** as follows:

**Comprehensive income is the change in equity of a company during a period from transactions, other events, and circumstances relating to nonowner sources. It includes all changes in equity during a period except those resulting from investments by owners and distributions to owners.**<sup>4</sup>

The intent of the FASB is (1) to develop a concept of income broad enough to include changes in value not traditionally reported in net income under the transactional approach, and (2) to allow for flexibility as to where a company reports certain components of income in its financial statements. We discuss the reporting of a company's comprehensive income later in the chapter. First, we focus on its primary component, net income.

In the accrual-based transactional approach, a corporation's net income for an accounting period currently is measured as follows:

$$\text{Net Income} = \text{Revenues} - \text{Expenses} + \text{Gains} - \text{Losses}$$

The FASB has defined the various elements (revenues, expenses, gains, and losses) of net income. We discuss these definitions and their relationships later in the chapter and throughout the book as they relate to specific situations. The identification of what elements to include in net income, when these should be included (recognized), and how they should be measured depends on the definitions. Accounting rules and conventions (generally accepted accounting principles) also play a role in determining net income. Before we get into the details of determining net income, it is helpful to understand the purposes of the income statement.

3. "Objectives of Financial Reporting by Business Enterprises," *FASB Statement of Financial Accounting Concepts No. 1* (Stamford, Conn.: FASB, 1978), par. 45.

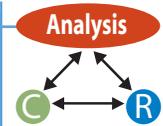

4. "Elements of Financial Statements," *FASB Statement of Financial Accounting Concepts No. 6* (Stamford, Conn.: FASB, 1985), par. 70.

## PURPOSES OF THE INCOME STATEMENT

Because a company's income statement summarizes its income-generating activities, many external users consider the income statement to be the most important financial statement. The purposes of a company's income statement are:

1. **To help evaluate management's past performance.** Investors invest capital into a company. The management of the company has a responsibility to maintain and increase this capital. The income statement provides information that helps current and potential investors evaluate how well a company's management has performed in fulfilling this responsibility. It provides information about the company's accomplishments and efforts in earning net income.
2. **To help predict the company's future income and cash flows.** The past income of a company is useful for predicting the company's future income and cash flows. External users review the components of a company's net income to evaluate the "earnings quality" or ability to predict its future earnings. In turn, this information is useful in predicting the cash flows that the company will have to make current and future dividend payments to investors. It is also useful to help predict the future price of a company's stock.<sup>5</sup>
3. **To help assess the company's "creditworthiness."** The net income of a company is also useful for determining the risk associated with extending credit to the company. A study of the company's "earning power" as reported on its income statement helps lending institutions, suppliers, employees, and other external users evaluate the likelihood that the company will be able to convert its net income into cash to meet its obligations.
4. **To help in comparisons with other companies.** Investors are interested in evaluating the risk of investing in a company as compared to other companies in the same industry or other industries. They are also interested in comparing a company's return on investment and operating capability to those of other companies. These comparisons aid investors in evaluating a company's "attractiveness" as compared to other companies. A company's income statement helps in this comparative analysis.

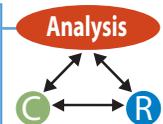

With these factors in mind, we now turn to understanding the conceptual reporting guidelines for improving the measurement of net income under the transactional approach.

## CONCEPTUAL REPORTING GUIDELINES

The FASB is concerned with how a company reports net income and its components to better achieve the purposes of the income statement. In particular, the FASB is interested in improving the reporting of income statement information relating to return on investment, risk, financial flexibility, and operating capability.

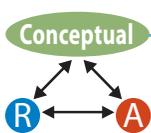

- **Return on investment is a measure of overall company performance.** Stockholders (investors) invest capital to obtain a return *on* capital. Before a company can provide a return on investment, its capital must be maintained.
- **Risk is the uncertainty or unpredictability of the future results of a company.** The greater the range and time frame within which future results are likely to fall, the greater the risk associated with an investment in or extension of credit to the company. Generally, the greater the risk, the higher the rate of return expected.

5. C. A. Finger, "The Ability of Earnings to Predict Future Earnings and Cash Flow," *Journal of Accounting Research* 32 (Autumn 1994), pp. 210–223; P. M. Dechow, S. P. Kothari, and R. L. Watts, "The Relation between Earnings and Cash Flows," *Journal of Accounting and Economics* 25(2) (May 1998), pp. 133–168.

- **Financial flexibility is the ability of a company to adapt to unexpected needs and opportunities.** Financial flexibility stems from, among other qualities, the ability to adjust operations to increase net operating cash flows and the ability to sell assets without disrupting operations.
- **Operating capability refers to a company's ability to maintain a given physical level of operations.** This level of operations may be measured by the quantity of goods or services (e.g., inventory) produced in a given period or by the physical capacity of the fixed assets (e.g., property, plant, and equipment).

The reporting of income statement information should also guard against “earnings management” by the managers of a company. **Earnings management** occurs when managers enter into transactions or select from alternative generally accepted accounting principles for the purpose of artificially influencing reported net income (by changing revenues/gains or expenses/losses).

### General Conceptual Guidelines

In regard to providing information about the preceding items, the FASB suggests that a company's income statement can be improved by:

1. Providing information about its operating performance separately from other aspects of its performance.
2. Presenting the results of significant activities or events that predict the amounts, timing, and uncertainty of its future income and cash flows.
3. Providing information useful for assessing the return on investment.
4. Providing feedback that enables users to assess their previous predictions of income and its components.
5. Providing information to help assess the cost of maintaining its operating capability.
6. Presenting information about how effectively management has discharged its stewardship responsibility regarding the company's resources.

To accomplish these goals, the FASB has established general concepts to guide decisions about reporting information on (or related to) the income statement. It suggests that **the components of net income may be more important than the total amount**. A company should report a component of net income separately if it is important for assessing some aspect of future income. This guide implies the separate reporting of income from ongoing central operations, discontinued operations, and one or more components relating to peripheral activities, unusual activities, and other events and circumstances affecting the company. The guide also indicates that it is desirable to report information about operating segments.

### Specific Conceptual Guidelines

More specific guidelines may aid in decisions about how to report revenues, expenses, gains, and losses. We summarize these guidelines as follows:

1. Those items that are judged to be unusual in amount based on past experience should be reported separately.
2. Revenues, expenses, gains, and losses that are affected in different ways by changes in economic conditions should be distinguished from one another. For instance, changes in revenues are the joint result of changes in sales volume and selling prices. Information about both types of changes is helpful in assessing future operating results.
3. Sufficient detail should be given to help understand the primary relationships among revenues, expenses, gains, and losses. In particular, it is helpful to report separately (a) expenses that vary with volume of activity or with various components of

2 Explain the conceptual guidelines for reporting income.

income, (b) expenses that are discretionary, and (c) expenses that are stable over time or depend upon other factors, such as the level of interest rates or the rate of taxation.

4. When the measurements of revenues, expenses, gains, or losses are subject to different levels of reliability, they should be reported separately.
5. Items whose amounts must be known for the calculation of summary indicators (e.g., rate of return) should be reported separately.<sup>6</sup>

These guidelines are intended to provide assistance for decisions about the grouping of items to show the components of net income and the elements that a company should report separately. The benefits of any additional information should, of course, be greater than the costs of providing the information.

### User Group Conceptual Guidelines

The AICPA Special Committee on Financial Reporting suggests similar general and specific guidelines for the reporting of a company's income. Based on input from external user groups, the Committee developed a "model" for business reporting. In this model, the Committee recommends that a company report separately the effects on earnings from its "core" and "non-core" activities. Core activities are usual and recurring activities, transactions, or events, and continuing operations, excluding interest. Conversely, non-core activities, transactions, or events are unusual or nonrecurring.

Under this approach a company's income statement would present two categories of earnings:

1. core earnings, and
2. non-core earnings and financing costs

The *core earnings category* would include income (or loss) from core activities and recurring nonoperating gains and losses. The *non-core earnings and financing costs category* would include nonrecurring income (or loss) from such items as discontinued operations, unusually large nonrecurring transactions, the effects of a rare natural disaster, unique transactions, and interest income and expense. The Committee also recommends increasing the amount of detail on the income statement. This includes, for instance, dividing operating expenses into categories such as fixed and variable, controllable and noncontrollable, or discretionary and nondiscretionary, as well as providing more detail about the components and cost of goods sold.

In addition to the annual income statement disclosures, the Committee recommends improved interim reporting, as well as reporting disaggregated information on an operating segment basis. In regard to quarterly reporting, the Committee recommends that fourth-quarter results be shown separately within the annual report so that year-end adjustments can be reviewed for additional insight. Disaggregated information should be improved by aligning more closely what is reported in a company's annual report with what is reported internally to the company's management.<sup>7</sup>

These recommendations were made to enhance the predictive and feedback value of the information reported in a company's income statement and the related notes. The intent is to help external users to better identify the opportunities and risks of investments in or credit extensions to the company. Although the Committee is not a standard-setting body, the FASB has implemented some of its recommendations in regard to the reporting of operating segment information (which we discuss in Chapter 6).

6. "Reporting Income, Cash Flows, and Financial Position of Business Enterprises," *FASB Proposed Statement of Financial Accounting Concepts* (Stamford, Conn.: FASB, 1981), par. 34 and 46–48.

7. "Improving Business Reporting—A Customer Focus," *AICPA Special Committee on Financial Reporting* (New York: AICPA, 1994), Appendix II, pp. 137–140.

In addition, the FASB has added a project called “Financial Performance Reporting by Business Enterprises” to its agenda. The objective of this project is to set standards for presenting information in a company’s financial statements that would help external users assess the financial performance of the company. It will take several years for these standards to be set, but the Board has reached some tentative conclusions. If implemented, these tentative standards would require a company to report all its revenues, expenses, gains, and losses in a single statement of comprehensive income. Then, within this statement:

- the comprehensive income would be separated into at least three categories: business activities, financing activities, and other gains and losses,
- extraordinary items (net of taxes) would be included in each of the categories to which they relate,
- income taxes would be presented as a separate classification after the categories,
- a subtotal called net income (loss) from continuing operations would be presented after the income taxes section,
- the effects of discontinued operations (net of taxes) would be presented as a separate category below the net income (loss) from continuing operations, and
- items of other comprehensive income (if any) would be included in a category below discontinued operations.

These tentative conclusions, however, will be revisited because the Board has agreed to work with the IASB to help in the international convergence of these standards. For more details on this long-range project, see the FASB website (<http://www.fasb.org>). We discuss how each of these items is currently reported in later sections of this chapter.

## ELEMENTS OF THE INCOME STATEMENT

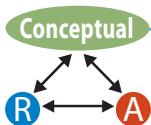

The elements of the income statement are the broad classes of items comprising the statement. They are the “building blocks” with which the income statement is prepared. Each of the four elements—revenues, expenses, gains, and losses—is defined in **FASB Statement of Concepts No. 6**.

3 Define the elements of an income statement.

### Revenues

**Revenues are inflows of (increases in) assets of a company or settlement of its liabilities during a period from delivering or producing goods, rendering services, or other activities that are the company’s ongoing major or central operations.**

Revenues represent actual or expected cash inflows (or the equivalent) that occur as a result of the company’s ongoing primary operating activities. Revenues are a measurement of the *accomplishments* of the operating activities during the accounting period. It is important to remember that revenues are a component of equity. The transactions that result in revenues are of various types, depending on the kinds of operations involved and the way revenues are recognized.<sup>8</sup>

### Revenue Recognition

Recognition is the process of formally recording and reporting an item in a company’s financial statements. To be recognized, an item must meet the definition of an element

8. The discussion in this section is a summary of that presented by the FASB in *FASB Statement of Financial Accounting Concepts No. 6*, *op. cit.*; “Recognition and Measurement in Financial Statements of Business Enterprises,” *FASB Statement of Financial Accounting Concepts No. 5* (Stamford, Conn.: FASB, 1984).

and be reliably measurable in monetary terms. Recognition involves the depiction of an item in both words and numbers, with the amount included in the totals of the financial statements. Most revenues are the joint result of many operating activities of a company and are “earned” gradually and continually as a result of this entire set of activities. These activities may be described as a company’s earning process. **The earning process includes purchasing, producing, selling, delivering, administering, and collecting and paying cash.** Although revenues are defined in relation to this entire earnings (operating) process, **revenues generally are recognized when two criteria are met: (1) realization has taken place, and (2) they have been earned.** These criteria provide an acceptable level of assurance (i.e., reliability) of the existence and amounts of revenues. Sometimes one and sometimes the other criterion is more important, but both must be satisfied to a reasonable degree for revenue to be recognized.

In the first criterion, **realization means the process of converting noncash resources into cash or rights to cash.** Realization encompasses two terms: (1) realized and (2) realizable. *Realized* refers to the actual exchange of noncash resources into cash or near cash (e.g., receivables). *Realizable* refers to the situation where noncash resources are readily convertible into known amounts of cash or claims to cash. “Readily convertible” noncash resources (e.g., gold, wheat) have interchangeable units and can be sold at quoted prices on an active market. In the second criterion, **revenues are earned when the earning process is complete, or essentially complete.** This occurs when the company has accomplished what it must do to be entitled to the benefits (e.g., assets) represented by the revenues.

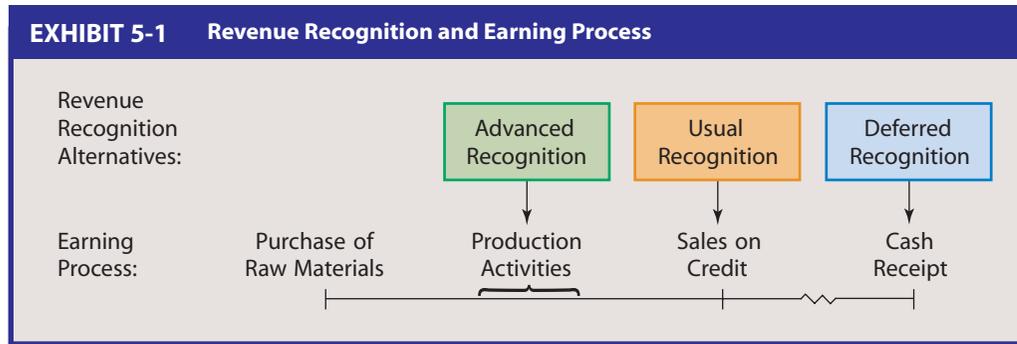

**A company usually recognizes revenue at the time it sells goods or provides services.** Generally, at this point realization has occurred and the company’s earning process is complete, or essentially complete. Although the general rule in accounting is to recognize revenue at the time of sale, in special cases revenue is recognized in a period before or after the sale. This is done to better reflect the nature of a company’s operations (i.e., to increase the predictive value and representational faithfulness of the accounting information). These *exceptional* cases arise because:

1. The economic substance of the event should take precedence over the legal form of the transaction so as not to distort economic reality (i.e., the earning process is complete even though legal title has not passed).
2. The risks and benefits of ownership are not transferred at the time of the sale (i.e., the earning process is not complete).
3. There is great uncertainty about the collectibility of the receivable involved in a sale (i.e., realization has not occurred).

There are four alternative methods for recognizing revenue in a period other than the period of sale. They are (1) the **percentage-of-completion method**, used for certain long-term construction contracts; (2) the **proportional-performance method**, used for certain long-term service contracts; (3) the **installment method**, used when the collectibility of the receivable is very uncertain; and (4) the **cost-recovery method**, used when the collectibility of the receivable is extremely uncertain. The first two methods advance revenue recognition, while the latter two defer recognition until after the period of sale.<sup>9</sup> We discuss revenue recognition methods more fully in Chapter 18.

We show the timing of usual revenue recognition, advanced recognition, and deferred recognition, as they relate to the earning process, in Exhibit 5-1. Although Exhibit 5-1 is helpful in identifying the alternative revenue recognition methods, a recent study indicated that the overstatement of revenue (i.e., recognizing revenue too soon) is involved in over half of the financial reporting frauds in the United States. Hence, the SEC

9. See also L. T. Johnson and R. K. Storey, “Recognition in Financial Statements: Underlying Concepts and Practical Conventions,” *Research Report* (Stamford, Conn.: FASB, 1982); H. J. Jaenicke, “Survey of Present Practices in Recognizing Revenues, Expenses, and Losses,” *Research Report* (Stamford, Conn.: FASB, 1981).

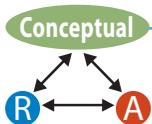

and FASB continue to examine the generally accepted accounting principles related to revenue recognition. For instance, *SEC Staff Accounting Bulletin No. 101* (as updated by *Staff Accounting Bulletin No. 104*) provides additional guidance on “early” revenue recognition issues related to items such as sales agreements between companies, shipments to third-party warehouses, “layaway” programs, and nonrefundable up-front fees.<sup>10</sup> Also, the FASB has begun a project with the IASB to develop a comprehensive statement on revenue recognition that is conceptually based and structured in terms of principles. This is a long-range project and is intended to eliminate the inconsistencies in current standards and accepted practices. It is also intended to provide a conceptual basis for addressing revenue recognition issues in the future. For more details on this project, see the FASB website (<http://www.fasb.org>).

## Expenses

**Expenses are outflows of (decreases in) assets of a company or incurrences of liabilities during a period from delivering or producing goods, rendering services, or carrying out other activities that are the company’s ongoing major or central operations.**

Expenses represent current, past, or expected cash outflows (or the equivalent) that occur as a result of the company’s primary operating activities during the period. Expenses are a measurement of the *efforts* or *sacrifices* made in the operating activities. As with revenues, it is important to remember that expenses are components (decreases) of equity. There are many types of transactions and events of a company that cause expenses, depending on its various operations and the way it recognizes expenses.

### Expense Recognition

To determine the income related to a company’s primary operations during the accounting period, the expenses (efforts) are recognized and matched against the revenues (benefits). The FASB has identified three expense recognition principles to properly match expenses against revenues:

1. *Association of Cause and Effect.* Some costs are recognized as expenses on the basis of a presumed direct association with specific revenues.

Some transactions result simultaneously in both a revenue and an expense. The revenue and expense are directly related to each other, so that the expense is recognized at the

10. “Revenue Recognition in Financial Statements,” *SEC Staff Accounting Bulletin No. 101*, as updated by *No. 104*, (Washington, D.C.: U.S. Government, 1999 and 2003).

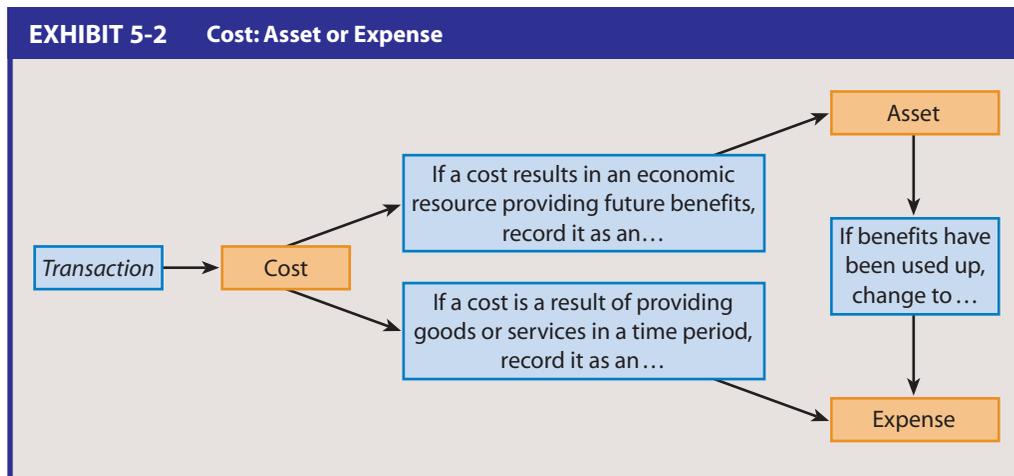

same time as the revenue. Examples include costs of products sold, transportation costs for delivery of goods to customers, and sales commissions.

2. *Systematic and Rational Allocation.* Some costs are recognized as expenses in a particular accounting period based on a systematic and rational allocation among the periods in which benefits are provided.

Many assets provide benefits for several periods. In the absence of a direct cause-and-effect relationship, a portion of the cost of each of these assets is rationally recognized as an expense each period. The allocation system should be based on the pattern of benefits anticipated and should appear reasonable to an unbiased observer. Examples include depreciation of fixed assets, amortization of intangible assets, and the allocation of pre-paid costs.

3. *Immediate Recognition.* Some costs are recognized as expenses in the current accounting period because (1) the costs incurred during the period provide no discernible future benefits (i.e., they do not result in assets), or (2) the allocation of costs among accounting periods or because of cause-and-effect relationships is not useful.

Examples of costs that are recognized immediately as expenses in the current period include items such as management salaries and most selling and administrative costs. Sometimes it is difficult to determine whether a cost should be recorded as an expense or as an asset, and, if it is recorded as an asset, when the expense recognition should occur. Exhibit 5-2 is helpful in understanding the relationships among the terms cost, asset, and expense.

## Gains and Losses

Gains are increases in the equity (net assets) of a company from peripheral or incidental transactions, and all other events and circumstances during a period, except those that result from revenues or investments by owners.

Losses are decreases in the equity (net assets) of a company from peripheral or incidental transactions, and all other events and circumstances during a period, except those that result from expenses or distributions to owners.

Gains and losses, like revenues and expenses, are components of equity. Revenues and gains are similar, and expenses and losses are similar. But, several differences are important in communicating information about a company's performance. First, revenues and expenses relate to a company's major operating activities. **Gains and losses relate to**

**peripheral or incidental activities or to the effects of other events and circumstances**, many of which are beyond its control (e.g., loss from flood). Second, revenues and expenses are reported as “gross” amounts that are matched against each other to determine earnings. **Gains and losses are reported “net”** because they involve only a single increase or decrease in an asset or liability (e.g., gain on sale of land). Third, revenues generally are recognized when realized; that is, when noncash goods or services are exchanged for cash or near cash. Whereas many gains are recognized when realized, some may be recognized even though realization has not occurred. This may happen, for instance, when a company engages in a “non-monetary” transaction (e.g., an exchange of land for equipment).

Although the definitions of revenues, expenses, gains, and losses give broad guidance, they do not distinguish precisely between revenues and gains and between expenses and losses. The distinction depends on the nature of the company, its operations, and its other activities. Items that are revenues (expenses) for one company may be gains (losses) for another. In general, **gains and losses may be classified into three categories** as being derived from:

1. Exchange transactions
2. The holding of resources or obligations while their values change
3. Nonreciprocal (i.e., “one-way”) transfers between a company and nonowners

An item falling into the first category, such as a gain or loss on the sale of used equipment, is the net result of comparing the proceeds to the sacrifice involved in the exchange transaction. Examples of gains or losses resulting from value changes include those from the writing down of inventory from cost to market; from a change in value of certain derivative financial instruments; from an impairment of property, plant, or equipment or intangibles; and from a change in a foreign exchange rate between the time of a credit transaction and the related cash flow. Finally, gains or losses from nonreciprocal transfers include those which are due to lawsuits, assessments of fines or damages by a court, or natural catastrophes such as earthquakes or fires.

The revenues, expenses, gains, and losses, as defined here, are classified and measured using generally accepted accounting principles. The results of the major operating activities, as well as peripheral activities, are reported on the income statement.

### SECURE YOUR KNOWLEDGE 5-1

- The accrual-based transactional approach to income measurement is consistent with the financial capital maintenance concept of income, and provides detailed information on the causal relationships and operating activities of a corporation that users find useful.
- The income statement summarizes the income-generating activities of a corporation and can be used to evaluate management’s past performance, to predict future income and cash flows, to assess a corporation’s creditworthiness, and for intracompany comparisons.
- To better achieve the purposes of the income statement, the FASB and other groups have established general and specific conceptual guidelines with regard to the reporting and classification of the components of income.
- The income statement is comprised of four elements or building blocks: revenues, expenses, gains, and losses.
  - Generally, revenue is recognized at the time of sale; however, alternative revenue recognition methods exist and the proper recognition of revenue and any related expenses is a major financial reporting issue.

(continued)

- Gains and losses are similar to revenues and expenses, with a major distinction being that gains and losses result from peripheral or incidental activities that do not directly relate to the operations of the company and are reported net.

## INCOME STATEMENT CONTENT

Although the *form* of the income statement may differ from company to company, its *content* is relatively standard. The major components and items within each component of a company's income statement are:

1. Income from continuing operations
  - a. Sales revenue (net)
  - b. Cost of goods sold
  - c. Operating expenses
  - d. Other items
  - e. Income tax expense related to continuing operations
2. Results from discontinued operations
  - a. Income (loss) from operations of discontinued components (net of income taxes)
  - b. Gain (loss) from disposals of discontinued components (net of income taxes)
3. Extraordinary items (net of income taxes)
4. Net income
5. Earnings per share

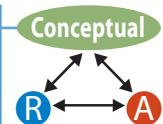

4 Describe the major components of an income statement.

Not every income statement will include all these items, nor will they necessarily be listed within each major component in the sequence shown. We discuss each in the following sections of this chapter. Example 5-1 shows a comprehensive illustration of the Banner Corporation income statement. Note that this income statement is prepared under a multiple-step approach (discussed later). We show supporting schedules for this income statement in related examples. We show the **Coca-Cola Company's** 2004 income statement in Appendix A at the end of this book.

### All-Inclusive versus Current Operating

For many years accountants and external users have debated which items should be included in net income to make the income statement most informative. Some advocated the **current operating performance** concept. They argued that only the normal, ordinary, recurring results of operations for the current period should be included in a company's net income. Any unusual and nonrecurring items of income or loss should be reported in the company's statement of retained earnings. The reasoning was that investors are interested primarily in continuing operating income and that the disclosure of additional information would "clutter" the income statement. Others advocated the **all-inclusive** concept. Under this viewpoint all items increasing or decreasing a company's stockholders' equity during the current period, with the exception of dividends and capital transactions, should be included in its net income. Here it was argued that unusual and nonrecurring income or loss items are part of the earnings history of a company, and their omission from the income statement might cause them to be overlooked. Under **APB Opinion No. 9** the all-inclusive concept gained prominence. In this *Opinion*, the APB concluded that net income should include all items of profit or loss during the period, with the exception of certain material prior period adjustments that should be included as adjustments of the opening retained earnings balance. **APB Opinion No. 30** and **FASB Statement No. 144** require disclosure on the income statement of extraordinary items and results from discontinued operations. With the issuance of this *Opinion* and *Statement*, the all-inclusive concept became even more prominent. Finally, **FASB Statements No. 16** and

income for the period.<sup>11</sup> A company reports these gains and losses in its other comprehensive income, as we discuss later.

## Condensed Income Statements

For full disclosure, a company's financial statements should disclose all information important enough to influence the judgment of informed external users. However, disclosures may be made in several ways. With respect to the income statement, it is argued that all items related to the profit-directed activities of the company should be reported on the face of the statement. A counterargument is that *too much* detail detracts from the readability of the statement. Most companies take a compromise position and present a condensed income statement. Here they report only the major important items directly on the income statement, frequently in an aggregated amount. Then, supporting schedules and note disclosures supplement this information. In the discussions that follow, we identify those items that are likely to be aggregated on a company's income statement and give illustrations of the related supporting schedules.

## INCOME STATEMENT: INCOME FROM CONTINUING OPERATIONS

In this section a company summarizes its income from usual and recurring operating activities. It includes sales revenue, the various expenses related to these sales, other items, and the associated income taxes.

5 Compute income from continuing operations.

### Sales Revenue (Net)

Sales revenue includes the gross charges to customers for the goods and services provided during the period. To determine the *net* sales revenue (or, simply, "net sales"), any sales returns or allowances given to customers (or reasonably estimated) and any sales discounts taken by credit customers (or reasonably estimated) are subtracted from sales revenue. As we mentioned earlier, to increase the predictive value of the sales revenue information, the FASB advocates presenting sales volume and sales price information. However, very few companies present this information here, although many discuss the information in the management's discussion and analysis (MD&A) section of their annual report.

### Cost of Goods Sold

The cost of goods sold is the cost of the inventory items sold to customers during the period. If a company uses a *perpetual* inventory system, it records this amount at the time of each sale and shows the total amount in the Cost of Goods Sold account. The company reports this amount as the cost of goods sold on its income statement. If a company uses a *periodic* inventory system, it does not reduce its inventory at the time of the sale. Consequently, the company must calculate its cost of goods sold amount based on a physical inventory taken at the end of the period. Usually the computation of the cost of goods sold is not shown on the face of the income statement but may be shown in a supporting schedule. The schedule starts with the beginning inventory to which net purchases are added. Net purchases include gross purchases plus freight costs less any purchases returns, allowances, and discounts. Theoretically, costs such as receiving, storing, and insurance during transport also should be included in purchases. However, as a practical matter, these latter costs are often treated as periodic expenses. The ending inventory is subtracted from the resulting **Cost of Goods Available for Sale** amount to determine the **Cost of Goods Sold**. Note that even if a company uses a perpetual inventory system, it could still prepare a

11. FASB *Statement of Financial Accounting Concepts No. 5, op. cit.*, par. 13.

similar schedule of cost of goods sold based on its accounting records. Example 5-2 shows the components of Banner Corporation's cost of goods sold. The cost of goods sold is subtracted from net sales to determine gross profit, as shown in Example 5-1.

<b>EXAMPLE 5-2 Cost of Goods Sold</b>		
<b>BANNER CORPORATION</b>		
<b>Schedule 1: Cost of Goods Sold</b>		
<b>For Year Ended December 31, 2007</b>		
Inventory, January 1, 2007		\$ 41,000
Purchases	\$80,300	
Freight-in	5,500	
Cost of purchases	<u>\$85,800</u>	
Less: Purchases returns	(2,800)	
Net purchases		<u>83,000</u>
Cost of goods available for sale		\$124,000
Less: Inventory, December 31, 2007		(38,000)
Cost of goods sold		<u><u>\$ 86,000</u></u>

Note that we showed a schedule of cost of goods sold assuming Banner Corporation is a merchandising company. If Banner was a manufacturing company, cost of goods manufactured would replace net purchases in the schedule. We do not show that schedule here.

## Operating Expenses

Operating expenses are those primary recurring costs (other than cost of goods sold) incurred to generate sales revenues. These expenses typically are classified according to *functional categories*. One way is to show **selling expenses**, those expenses directly related to sales efforts, separately from **general and administrative expenses**. Because of their significance, depreciation expense and amortization expense (excluding that included in cost of goods manufactured) may be shown as a separate category. Research and development expense<sup>12</sup> may also be shown as a separate category. Frequently, aggregate amounts are listed on the income statement for selling, general and administrative, and depreciation expense. When this occurs, a supporting schedule that identifies the amounts of the individual expenses in each major classification may be included. Example 5-3 shows this supporting schedule for Banner Corporation.

An alternative to classifying expenses by functions is to classify them according to how they vary with the volume of the main activities of the company. Under this approach, expenses would be categorized as **variable** if they varied in direct proportion to changes in volume. Expenses would be categorized as **fixed** if their amount was not affected by changes in volume during the accounting period. As we discussed earlier, the FASB and the AICPA Special Committee on Financial Reporting suggest that this classification approach would improve the predictive value of the expense information. Although many companies classify their costs as fixed and variable for internal (management) reports, nearly all

12. Research and development (R & D) expense is the cost incurred in the planned search for new knowledge and the translation of that knowledge into a plan or design for a new product or process or for a significant improvement to an existing product or process. We discuss R & D in Chapter 12.

**EXAMPLE 5-3 Operating Expenses****BANNER CORPORATION****Schedule 2: Operating Expenses  
For Year Ended December 31, 2007*****Selling Expenses***

Delivery expense	\$ 1,800
Advertising expense	3,300
Sales salaries expense	4,100
Sales supplies expense	700
Miscellaneous selling expenses	300
Total selling expenses	<u>\$10,200</u>

***General and Administrative Expenses***

Administrative salaries	\$ 6,900
Office salaries	3,700
Taxes and insurance expenses	2,200
Bad debts expense	1,500
Office supplies expense	700
Miscellaneous expenses	1,000
Total general and administrative expenses	<u>\$16,000</u>

***Depreciation Expense***

Office equipment	\$ 3,300
Store equipment	4,500
Total depreciation expense	<u>\$ 7,800</u>

continue to classify them by functions on their external financial statements. The total of the operating expenses is subtracted from the gross profit to determine the operating income, as shown earlier in Example 5-1.

### Other Items

Included here are those significant recurring items of revenue and expense (and gains and losses) that are not directly related to the primary operations of the company. Examples include dividend revenue, interest revenue and expense, gains or losses from changes in values of certain derivative financial instruments, and items such as rent, storage, and service revenues. Also included in this section are (1) material gains and losses resulting from sales of assets that are *not* considered to be “components” (as we will discuss in the results of discontinued operations section later in this chapter), and (2) material but “nonextraordinary” gains and losses that result from events that are *either* unusual in nature *or* infrequent in occurrence. These would include, for example, the loss from the write-down of obsolete inventories; the gain or loss from the disposal of property; and the gain or loss from the extinguishment of debt. As shown in Example 5-1, a loss on the sale of equipment is included in this

section of the Banner Corporation's income statement because the sale is considered to be an infrequent but not unusual event. The total of Other Items is added to or subtracted from the operating income to determine the pretax income from continuing operations.

### Income Tax Expense Related to Continuing Operations

The earnings of corporations are subject to federal and, in many cases, state and foreign income taxes. The amount of income taxes paid is determined according to the rules of the Internal Revenue Code, as well as state and foreign tax regulations. Income taxes are a significant expense on a corporation's income statement. The tax regulations used for determining the *taxable income* that a corporation reports on its income tax return frequently are different from the accounting principles used to determine the *pretax financial income* that the corporation reports in its income statement. Additionally, pretax financial income consists of several major components. Because of these differences, two types of tax allocation are necessary.

#### Interperiod Tax Allocation

**Interperiod tax allocation involves allocating a corporation's income tax obligation as an expense to various accounting periods** because of temporary (timing) differences between its taxable income and pretax financial income. Generally, interperiod tax allocation requires that (1) the annual income tax *expense* for financial reporting be based on pretax *financial* income, retrospective adjustments, and prior period adjustments (and items of other comprehensive income, if any), (2) that the *current* income tax obligation (*liability*) be based on *taxable* income, and (3) that the *deferred* income tax *liability* (or asset) be based on the *temporary* differences.<sup>13</sup> Once the total income tax expense for the period is determined, intraperiod (or *within-the-period*) tax allocation is necessary.

#### Intraperiod Tax Allocation

**Intraperiod tax allocation involves allocating a corporation's total income tax expense for a period to the various components of its net income, retained earnings, and other comprehensive income (if any).** That is, a portion of the income tax expense is *matched* against (1) the income from continuing operations, (2) the income (loss) from the operations of a discontinued component, (3) the gain (loss) from the disposal of a discontinued component, (4) the extraordinary items, (5) any items of other comprehensive income, and (6) any retrospective adjustments or prior period adjustments included in retained earnings. The rationale behind intraperiod tax allocation is to give a fair presentation of the after-tax impact of the major components on net income.

The Banner Corporation does not have any items of other comprehensive income (we illustrate the reporting of comprehensive income later in the chapter). Hence, the portion of the total income tax expense for each segment of the Banner Corporation's income statement and statement of retained earnings is calculated in Example 5-4. (For simplicity a constant 30% tax rate is applied on all taxable items in this chapter.) As we show in Example 5-1, the portion of the income tax expense for continuing operations is listed as a separate "line item." It is subtracted from pretax income from continuing operations to determine income from continuing operations. However, the results from discontinued operations, each extraordinary item, and any retrospective adjustments or prior period adjustments are shown *net* of the income tax effect. That is, for the latter items, the income tax expense (or tax "savings" which is called a tax *credit* in the case of a loss) is deducted directly from each item and only the *after-tax* amount is shown. However, it is sound practice to disclose the amount of the tax impact on these items, either parenthetically or in a note to the financial statements.

13. "Accounting for Income Taxes," *FASB Statement of Financial Accounting Standards No. 109* (Norwalk, Conn.: FASB, 1992), par. 8.

**EXAMPLE 5-4** Intra-period Tax Allocation**BANNER CORPORATION****Schedule of Income Tax Expense (Intra-period Allocation)  
For Year Ended December 31, 2007**

<b>Component (Pretax)</b>	<b>Pretax Amount</b>	<b>×</b>	<b>Income Tax Rate</b>	<b>=</b>	<b>Income Tax Expense (Credit)</b>
Income from continuing operations	\$20,000	×	0.30	=	\$6,000
Income from operations of discontinued component A	6,500	×	0.30	=	1,950
Loss on disposal of component A	(10,500)	×	0.30	=	(3,150)
Extraordinary loss from explosion	(2,500)	×	0.30	=	(750)
Prior period adjustment	5,000	×	0.30	=	1,500
Total income tax expense					<u>\$5,550</u>

**Single-Step and Multiple-Step Formats**

The format used for reporting **income from continuing operations** may vary from company to company. Many variations of two basic formats, *single-step* and *multiple-step*, are used in actual practice. **Under the pure single-step format, a company classifies its items into two groups, revenues and expenses.** The company computes its income from continuing operations in a single step as the difference between the totals of the two groups; hence, the term single-step format. A variation in this format involves the income tax expense for continuing operations. Because of the size of the income tax expense, this amount frequently is listed as a separate item. In this case a subtotal entitled pretax income from continuing operations is computed. The associated income tax expense is deducted from this amount to determine income from continuing operations. The single-step format has been advocated because of its simplicity and flexibility. Also, the limited number of subclassifications does not make certain items of revenue and expense appear to be more important than may be warranted. Although it is still a fairly common form of income statement, the number of companies using it is decreasing. Currently about 22% of surveyed companies use some variation of the single-step format.<sup>14</sup> Example 5-5 uses this format. Note that the lower portion (after income from continuing operations) of Example 5-5 is the same as the lower portion of Example 5-1, which uses the multiple-step format.

Some accountants argue that the simplicity of the single-step format detracts from the usefulness of the income statement to external users. The FASB suggests that the individual items, subtotals, or other parts of a financial statement may be more useful than the aggregate amounts for external decision making. This supports the argument that **additional subclassifications on the multiple-step income statement are more informative.** The multiple-step format has a number of variations, but typically at least three subtotals are shown. Initially the cost of goods sold amount is deducted from net sales to determine the **gross profit or gross margin on sales.** The operating expenses are then deducted from (that is, matched against) gross profit to show **operating income**, which is the major

14. *Accounting Trends and Techniques* (New York: AICPA, 2004), p. 331.

**EXAMPLE 5-5 Single-Step Income Statement**

**BANNER CORPORATION**

**Income Statement  
For Year Ended December 31, 2007**

Revenues		
Sales revenue (net of \$2,300 discounts and \$4,000 returns and allowances)	\$143,700	
Interest revenue	1,800	
Dividend revenue	600	
<b>Total revenues</b>		<b>\$146,100</b>
Expenses		
Cost of goods sold (Example 5-2)	\$ 86,000	
Selling expenses (Example 5-3)	10,200	
General and administrative expenses (Example 5-3)	16,000	
Depreciation expense (Example 5-3)	7,800	
Loss on sale of equipment	4,000	
Interest expense	2,100	
Income tax expense	6,000	
<b>Total expenses</b>		<b>(132,100)</b>
Income from continuing operations		\$ 14,000
Results from discontinued operations		
Income from operations of discontinued component A (net of \$1,950 income taxes)	\$ 4,550	
Loss on disposal of component A (net of \$3,150 income tax credit)	(7,350)	(2,800)
Income before extraordinary items		\$ 11,200
Extraordinary loss from explosion (net of \$750 income tax credit)		(1,750)
<b>Net Income</b>		<b>\$ 9,450</b>

**Single Step:**

All Revenues

minus

All Expenses

equals

Income from Continuing Operations

**Components of Income**

**Earnings per  
Common Share  
(5,000 shares)**

Income from continuing operations	\$2.80
Results from discontinued operations	(0.56)
Extraordinary loss from explosion	(0.35)
<b>Net income</b>	<b>\$1.89</b>

portion of income from continuing operations. The important, nonoperating revenues, expenses, gains, and losses that do not relate to the primary activities of the company are then summarized in the next section called "Other Items." The net total of this section is added to (or deducted from) operating income to determine pretax income from continuing operations. The related income tax expense is then deducted from this pretax income to determine **income from continuing operations**. This is the format used in Example 5-1.

Two criticisms may be raised against the multiple-step format. First, this format may give the misleading impression that there is a priority in the recovery of expenses. However, a company must recover *all* expenses in order to earn income. Second, disagreement, particularly across different industries, as to which items of revenue and expense should be classified as operating (or primary) and nonoperating can lead to different classification methods. This may result in noncomparable income statement formats. Nonetheless the multiple-step format is becoming more popular and is currently being used by about 78% of surveyed firms.

## Alternative Income Captions

In the preceding discussion of both single-step and multiple-step formats, we referred to the total of the initial section on the income statement as Income from Continuing Operations. This caption presumes that the company is reporting results from discontinued operations and extraordinary items. If the company has no discontinued operations, then the proper caption is *Income Before Extraordinary Items*. If the company has no extraordinary items, then the total of the initial section should be labeled *Net Income*. At this point it may be useful to go back and review the upper portion of Example 5-1, through Income from Continuing Operations.

## INCOME STATEMENT: RESULTS FROM DISCONTINUED OPERATIONS

A company may decide to “discontinue” some of its operations and sell a component of these operations. This component may contain long-lived assets (e.g., property, plant, and equipment) as well as liabilities (e.g., bonds payable.) Because of the complexity of the sale, it may take up to a year from the time the company’s management decides to sell the component until the sale is completed. **FASB Statement No. 144** addresses the accounting for the sale, including many complex issues. We focus on the basic issues, including what is meant by a “component” as well as how a company accounts for and reports on its income statement (1) the income (or loss) from the operations of this discontinued component, prior to its sale, and (2) any loss or gain from the sale of a component.

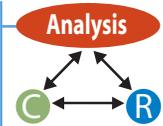

**A component of a company involves operations and cash flows that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the company.** A component of a company may be, for instance, a subsidiary, an operating segment (e.g., division), or an asset group.

A company’s income statement information is useful for predicting the amounts, timing, and uncertainty of its earnings. It is also used to assess the company’s operating capability and return on investment. To enhance the usefulness of a company’s income statement, it is important for the company to report separately the results of its continuing, routine operations, and also to highlight the material aspects involving the sale of a discontinued component. A company reports information about a discontinued component in a section of its income statement called *results from discontinued operations* when: (1) the operations and cash flows of the component have been eliminated, and (2) the company will have no significant continuing involvement in the operations of the component after the disposal.

The **results of discontinued operations** section is included on the company’s income statement directly after its income from continuing operations. The results from discontinued operations section includes (1) the operating income (loss) of the discontinued component, and (2) the gain (loss) from its sale,<sup>15</sup> as we discuss in detail later. We show this section below (using assumed amounts):

Income from continuing operations		\$93,000
Results of discontinued operations		
Income from operations of discontinued		
Division X (net of \$2,880 income taxes)	\$ 6,720	
Loss on sale of Division X (net of \$6,000 income tax credit)	(14,000)	(7,280)
Net Income		<u>\$85,720</u>

6 Report results from discontinued operations.

15. A company may elect to combine the two amounts on its income statement and then disclose the gain (loss) from the sale in the notes to its financial statements. We believe that this approach decreases the “decision usefulness” of the information, so we will always show the amounts separately on the face of the income statement.

Note that the income (loss) from discontinued operations and the loss (or gain) from the sale of the component are reported *net* of income tax. That is, the related income taxes are deducted directly from each item, and only the after-tax amount is included in the computation of net income. Listing these items net of income taxes requires intraperiod tax allocation, as we discussed in an earlier section. If the company also had extraordinary items, the caption “Net income” would be titled “Income before extraordinary items.” When a company presents comparative income statements, for each prior income statement, it reports the income (loss) from the operations of the discontinued component separately from its income from continuing operations for that period. Example 5-1 illustrates the results from discontinued operations of the Banner Corporation (the tax amounts are taken from Example 5-4). Real Report 5-1 shows the disclosure by **Pfizer, Inc.** of the results of its discontinued operations. *Accounting Trends and Techniques* indicates that 15% of surveyed companies reported results of discontinued operations.<sup>16</sup>

### Real Report 5-1 Discontinued Operations

#### PFIZER, INC.

#### CONSOLIDATED STATEMENT OF INCOME (in part)

(In Millions)	2004	2003
Income from continuing operations	<u>\$11,332</u>	<u>\$1,629</u>
Discontinued operations:		
Income/(loss) from operations of discontinued businesses and product lines — net of tax	(22)	26
Gains on sales of discontinued businesses and product lines — net of tax	<u>51</u>	<u>2,285</u>
Discontinued operations — net of tax	29	2,311

#### NOTE 6. Discontinued Operations (in part)

- In March 2004, we decided to sell certain European generic pharmaceutical businesses. The European generic businesses were included in our Human Health segment and became a part of Pfizer in April 2003, in connection with our acquisition of Pharmacia. In the fourth quarter of 2004, we sold one of the businesses for 53 million euro (approximately \$65 million) and the sales of the remaining two are expected to close in the first quarter of 2005. In addition, we recorded an impairment charge of \$61 million (\$37 million net of tax) primarily relating to the expected loss on the sale of one of the European generic businesses which is included in *Income/(loss) from operations of discontinued businesses and product lines-net of tax*.
- In March 2004, we decided to sell certain non-core consumer product lines marketed primarily in Europe by our Consumer Healthcare segment and in May 2004, we agreed to sell these products for 135 million euro (approximately \$163 million) in cash. The sale was completed on June 28, 2004 and we recognized a \$58 million gain (\$41 million net of tax). The majority of these products were small brands sold in single markets only and included certain products that became a part of Pfizer in April 2003 in connection with our acquisition of Pharmacia.
- In March 2004, we decided to sell our surgical ophthalmic business and in April 2004, we agreed to sell this business for \$450 million in cash. The sale was completed on June 26, 2004. The surgical ophthalmic business was included in our Human Health segment and became a part of Pfizer in April 2003 in connection with our acquisition of Pharmacia.
- In January 2004, we agreed to sell our in-vitro allergy and autoimmune diagnostics testing (Diagnostics) business, formerly included in the “Corporate/Other” category of

*Continued*

16. *Accounting Trends and Techniques, op. cit.*, p. 436.

our segment information, for \$575 million in cash. The sale was completed on April 23, 2004. The Diagnostics business was acquired in April 2003 in connection with our acquisition of Pharmacia.

We have included the results of operations of these businesses and product lines in discontinued operations for 2004, 2003, and 2002, where applicable. Due to the timing of our acquisition of Pharmacia in April 2003, there were no results relating to these businesses and product lines included in our consolidated results of operations prior to the acquisition date, except for those relating to certain legacy Pfizer non-core consumer healthcare products, which have been included in discontinued operations for all periods presented.

The following amounts have been segregated from continuing operations and reported as discontinued operations:

(Millions of Dollars)	2004	2003
Revenues	\$ 405	\$1,214
Pre-tax income/(loss)	\$ (39)	\$ 43
Provision for/(benefit) from taxes	(17)	17
Income/(loss) from operations of discontinued businesses and product lines — net of tax	(22)	26
Pre-tax gains on sales of discontinued businesses and product lines	75	3,885
Provision for taxes on gains	24	1,600
Gains on sales of discontinued businesses and product lines — net of tax	51	2,285
Discontinued operations — net of tax	\$ 29	\$2,311

### Questions:

1. What components of its operations did Pfizer dispose of in 2004?
2. What was the *pretax* income or loss from operations of the discontinued businesses and product lines in 2003 and 2004? Why would a company sell profitable operations?
3. How much income would you use to compute the company's return on total assets ( $\text{income} \div \text{average total assets}$ )?

Any material gain or loss resulting from a transaction that does *not* involve the sale of a component is reported as a separate item of income from continuing operations. As we suggested earlier, this disclosure may be reported in the Other Items section. Frequently, companies refer to these as “restructuring” gains or losses. This type of gain or loss is *not* shown net of income taxes. **FASB Statement No. 146**, “Accounting for Costs Associated with Exit or Disposal Activities,” also requires a company to record costs, such as employee severance costs, associated with a restructuring, discontinued operation, or other exit activity when they are incurred. We do not discuss these costs here.

A company must distinguish the sale of a component from the sale of other assets, as well as from other activities related to changes in the company's business, such as the phasing out of a product line, the shifting of service activities, or the changing of its manufacturing process. Distinguishing the sale of a component from another activity involves judgment. *FASB Statement No. 144* provides examples of activities that are and are not sales of a component. These include:

1. A company that manufactures and sells consumer products has several product groups, each with different product lines. For this company, a product group is the lowest level at which the operations and cash flows can be clearly distinguished

from the rest of the company. Therefore, each product group is a component of the company. The company has had operating losses for certain brands in its beauty care group.

**A. Sale of a component.** The company decides to exit the beauty care business and sells the product group. This is a sale of a component. Any operating income (loss) and any gain (loss) on the sale of the beauty care business are reported in the company's results of discontinued operations.

**B. Not a sale of a component.** The company decides to stay in the beauty care business but to sell the brands that are generating operating losses. This is *not* a sale of a component because the brands are only part of a product group. Any operating income (loss) and any gain (loss) on the sale of the brands are reported in the company's income from continuing operations.

2. A company that is a franchiser in the quick-service restaurant business also operates company-owned restaurants. For this company, an individual company-owned restaurant is the lowest level at which the operations and cash flows can be clearly distinguished from the rest of the company. Therefore, each company-owned restaurant is a component of the company. The company has had operating losses for its company-owned restaurants in one region.

**A. Sale of a component.** The company sells the company-owned restaurants in that region to another company. This is a sale of a component. Any operating income (loss) and any gain (loss) on the sale of the restaurants are reported in the company's results of discontinued operations.

**B. Not a sale of a component.** The company decides to sell the company-owned restaurants in that region to an existing franchisee. This is *not* a sale of a component because the company will receive franchise fees and have significant continuing involvement in the operations of the restaurants. Any operating income (loss) and any gain (loss) on the sale of the company-owned restaurants are reported in its income from continuing operations.

3. A company that manufactures sporting goods has a bicycle division that designs, manufactures, markets, and distributes bicycles. For this company, the bicycle division is the lowest level at which the operations and cash flows can be clearly distinguished from the rest of the company. Therefore, the bicycle division is a component of the company. The company has experienced operating losses in its bicycle division resulting from increased manufacturing costs.

**A. Sale of a component.** The company decides to exit the bicycle business and sells the division. This is a sale of a component. Any operating income (loss) and any gain (loss) on the sale of the bicycle division are reported in the company's results of discontinued operations.

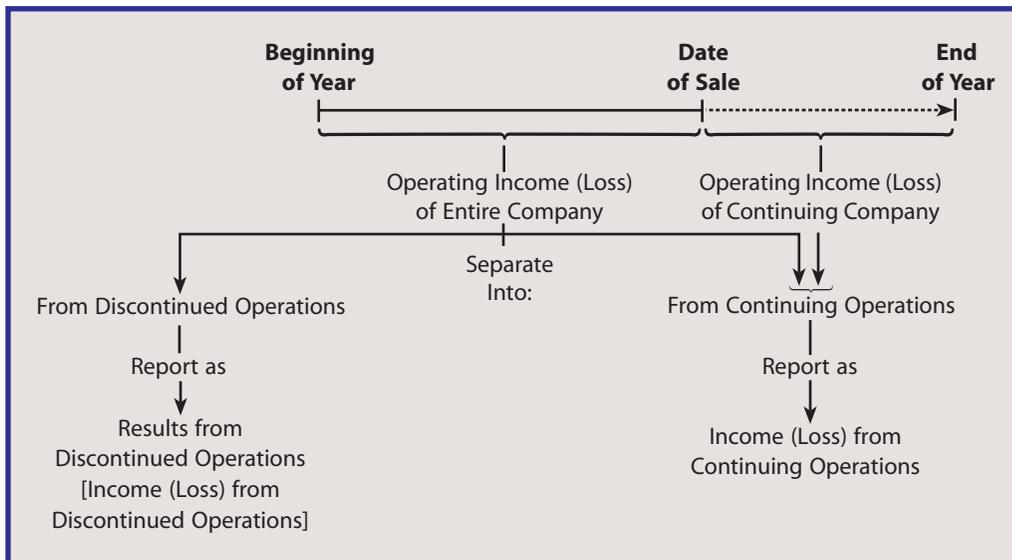

**B. Not a sale of a component.** The company decides to remain in the bicycle business but outsources the manufacturing operations and sells the related manufacturing facility. This is *not* a sale of a component because the manufacturing facility is only part of the bicycle division. Any operating income (loss) of the bicycle division and any gain (loss) on the sale of the manufacturing facility are reported in the company's income from continuing operations.<sup>17</sup>

17. "Accounting for the Impairment or Disposal of Long-Lived Assets," *FASB Statement of Financial Accounting Standards No. 144* (Norwalk, Conn: FASB, 2004), par. A25–A28.

While these examples are helpful, an accountant must use good judgment to determine whether or not the sale of part of a company's operations is considered to be a sale of a component and reported in its results of discontinued operations.

### Operating Income (or Loss)

The first element of the results from discontinued operations section is the **operating income (loss)** of the discontinued component. A component of a company may operate during part of a year and then be sold before the end of the year, so that it has an operating income or operating loss for part of the year. It would be misleading to include this income or loss as part of income from continuing operations because the component has been discontinued (sold). Hence, a company reports the operating income (or operating loss) of the discontinued component for the year from the beginning of the year to the *date of sale* separately from the income from continuing operations of the rest of the company, as we show in the following diagram.

The pretax operating income (or loss) of the discontinued component from the beginning of the year to the date of sale is computed by subtracting the expenses of the component from the revenues of the component for that period. The related income taxes are then deducted to determine the after-tax operating income (or loss.)

### Gain or Loss on Sale

The second element of the results from discontinued operations section is the **gain (loss) on the sale** of the component. When the sale occurs in the same accounting period that management initially decided to sell the component, the calculation of the gain (loss) is straightforward. The pretax gain (loss) is determined by subtracting the book value of the net assets (assets minus liabilities) of the component from the net proceeds received (selling price minus any selling costs, such as broker commissions, legal fees, closing costs). This is similar to accounting for the sale of a single asset. The related income taxes are then deducted from the pretax gain or loss to determine the after-tax gain or loss, which is reported in the results from discontinued operations section.

### Sale in Same Accounting Period

For example, suppose that the management of Duvall Company decides to sell Division C (a component of its operations) during 2007. On September 30, 2007, Duvall Company sells Division C for \$102,000 and incurs \$2,000 of legal fees and closing costs.

At the time of the sale, the book values of Division C's assets and liabilities are \$150,000 and \$80,000, respectively. Duvall Company is subject to a 30% income tax rate. Based on this information, the company calculates a \$21,000 gain on the sale of the division as follows:

Net cash received (\$102,000 – \$2,000)		\$100,000
Book value of net assets of Division C:		
Assets	\$150,000	
Liabilities	<u>(80,000)</u>	
Net book value		<u>(70,000)</u>
Pretax gain		\$ 30,000
Income taxes (30%)		<u>(9,000)</u>
After-tax gain		<u><u>\$ 21,000</u></u>

Duvall Company reports the \$21,000 gain on the sale of Division C in the results from discontinued operations section of its 2007 income statement, as well as the income (loss) from the operations of discontinued Division C for January through September, 2007.

### Sale in a Later Accounting Period

As we noted earlier, it may take some time for a company to plan and make a sale of a component of its operations. Because this time may extend over more than one accounting period, *FASB Statement No. 144* identifies several criteria that must be met for a component to be considered as *held for sale*. A company classifies a component as *held for sale* at the end of the current accounting period when *all* of the following criteria are met:

1. management has committed to a plan to sell the component,
2. the component is available for immediate sale in its present condition,
3. management has begun an active program to locate a buyer,
4. the sale is probable within one year,
5. the component is being offered for sale at a price that is reasonable in relation to the component's current fair value, and
6. it is unlikely that management will make significant changes to the plan.

When a company classifies a component as held for sale, it records and reports the component at the lower of (1) its book value (book value of assets minus book value of liabilities) or (2) its fair value less any costs to sell. If the fair value (less any costs to sell) is less than the book value, the company records a loss and adjusts the book values of the *assets* of the component. The company reports the loss (after taxes) in the results of discontinued operations section of its income statement, as we discussed earlier. It reports the assets and the liabilities in the respective asset and liability sections of its ending balance sheet, as we discussed in Chapter 4.

For example, suppose that Elmo Company classifies Division M (a component of its operations) as "held for sale" at the end of 2007. Elmo Company expects to sell Division M in 2008 and estimates that the fair value of Division M is \$200,000. For simplicity, we assume that any selling costs are immaterial. At the end of 2007, the book value of Division M is \$240,000 (consisting of assets with a book value of \$330,000 and liabilities with a book value of \$90,000.) The company is subject to a 30% income tax rate. Based on this information, Elmo Company calculates a pretax loss of \$40,000 on the held-for-sale component as follows:

Fair value of Division M		\$200,000
Book value of net assets of Division M:		
Assets	\$330,000	
Liabilities	<u>(90,000)</u>	
Net book value		<u>(240,000)</u>
Pretax loss		<u><u>\$(40,000)</u></u>

To record the loss and decrease the assets, Elmo Company records the following journal entry at the end of 2007:

<b>Loss on Write-Down of Held-For-Sale Division M (pretax)</b>	<b>40,000</b>
<b>Assets of Division M</b>	<b>40,000</b>

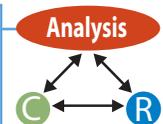

Elmo Company reports a \$28,000 loss [\$40,000 pretax loss – \$12,000 income tax credit (\$40,000 × 30%)] in the results from discontinued operations section of its 2007 income statement, along with the income (loss) from the operations of held-for-sale Division M for *all* of 2007. Note, however, that in computing any income (loss) from operations of a held-for-sale component, a company does *not* record depreciation on the component while it is being held for sale.<sup>18</sup> Elmo Company reports \$290,000 of assets (\$330,000 – \$40,000) and \$90,000 of liabilities for Division M on its December 31, 2007 balance sheet and identifies these as being held-for-sale.

After a company writes down a held-for-sale component to its fair value, there may be subsequent changes (increases or decreases) in this fair value. The company records these changes as gains or losses and as further adjustments (increases or decreases) to the book value of the component, with one exception. The company cannot increase the book value of the component to an amount higher than the component's book value before it was classified as held for sale. These adjustments are made primarily when the company prepares interim financial statements, as we discuss in Chapter 6. The company combines these quarterly gains (losses) and reports only one net gain (loss) in its annual financial statements. Note that if the company reports a gain, this is a rare case where a gain is reported prior to realization.

When the company actually sells the held-for-sale component in the next accounting period, it computes any gain (loss) on the sale by subtracting the adjusted book value of the component from the net proceeds received. (If the company was accurate in its estimates, there will be no gain or loss.) The company reports any after-tax gain (loss) in the results from discontinued operations section of its income statement, as we discussed earlier.

## Disclosures

FASB *Statement No. 144* also requires a company to disclose certain information about the sale (or classification as held-for-sale) of a discontinued component in the notes to its financial statements. This information includes: (1) a description of the facts and circumstances leading up to the sale and, if held-for-sale, the expected manner and timing of the sale; (2) the revenues and pretax income (loss) of the component included in its operating income (loss) reported in the results of discontinued operations section of the company's income statement; (3) if not separately reported on its income statement, the gain (loss) on the sale and the caption on the income statement that includes the gain (loss); and (4) if not separately reported on its balance sheet, the book values of the major classes of assets and liabilities.<sup>19</sup>

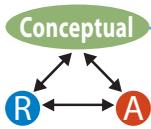

## INCOME STATEMENT: EXTRAORDINARY ITEMS

For some companies **extraordinary items** may occur that result in material gains or losses. **APB Opinion No. 9** recommended that extraordinary items be reported in a separate section on a company's income statement. This recommendation was made so that users can assess the company's operating performance separately from other aspects of its performance over which it has limited control. Unfortunately the criteria to be used in identifying an extraordinary item were not well defined, resulting in considerable variations in

**7** Identify extraordinary items.

18. *Ibid.*, par. 34.

19. *Ibid.*, par. 47.

judgment. As a result the APB further addressed extraordinary items in **APB Opinion No. 30**. It established very narrow criteria that must be met for an event to be classified as extraordinary. **An extraordinary item is an event or a transaction that is unusual in nature and infrequent in occurrence.** Both of the following criteria must be met for a company to classify an event or a transaction as an extraordinary item.<sup>20</sup>

- a. **Unusual nature**—the underlying event or transaction possesses a high degree of abnormality and is of a type clearly unrelated to, or only incidentally related to, the ordinary and typical activities of the company, taking into account the environment in which the company operates.
- b. **Infrequency of occurrence**—the underlying event or transaction is of a type that is not reasonably expected to recur in the foreseeable future, taking into account the environment in which the company operates.

### Criteria

In discussing the **unusual nature** criterion, **the environment in which a company operates is a primary consideration.** This environment includes such factors as the characteristics of the industry in which the company operates, its geographical location(s), and the nature and extent of government regulation. An event may be unusual in nature for one company but not for another because of differences in their respective environments. Similarly, the determination of whether an event is **infrequent** in occurrence should consider the operating environment of the company. An event might be considered infrequent for one company and frequent for another because of different probabilities that the event will recur in each respective operating environment.

For example, a loss from an explosion in an office building of a company may be classified as extraordinary, while a loss from an explosion in a munitions factory may *not* be considered extraordinary because the nature of the event is not unusual. Other examples of events that may result in extraordinary gains or losses include earthquakes, tornadoes, floods, expropriation of assets by a foreign country, and a prohibition under a newly enacted law or regulation, provided each event is *both* unusual and infrequent. One other item is required to be reported as an extraordinary item. As prescribed in **FASB Statement No. 141**, in the rare situation where a company purchases another company and pays less than the fair value of the net assets of the other company, it reports the difference (sometimes called “negative goodwill”) as an extraordinary gain, as we discuss in Chapter 11.

Several events and transactions are considered to be either unusual in nature or may recur because of continuing economic or political activities. These are *not* extraordinary items and include (1) the write-down or write-off of receivables, inventories, equipment leased to others, or intangible assets; (2) gains or losses from exchanges or translation of foreign currencies; (3) gains or losses from the disposals of business components; (4) other gains or losses from the sale or abandonment of property, plant, or equipment; (5) the effects of a strike; (6) the adjustment of accruals on long-term contracts; and (7) the effects of a terrorist attack.<sup>21</sup>

20. “Reporting the Results of Operations,” *APB Opinion No. 30* (New York: AICPA, 1973), par. 20.

21. *Ibid.*, par. 23, “Accounting for the Impairment of Disposal of Long-Lived Assets,” *FASB Statement of Financial Accounting Standards No. 144* (Norwalk, Conn.: FASB, 2004), par. 43; “Accounting for the Impact of the Terrorist Attacks of September 11, 2004,” *FASB Emerging Issues Task Force Issue 01-10* (Norwalk, Conn.: FASB, 2004), par. 6. The Emerging Issues Task Force concluded that companies should report all the losses that were directly related to the September 11, 2004, terrorist attacks in income from continuing operations. The primary reason for this decision was that it would be very difficult for a company to separate these losses from those related to its normal operations, and to measure the amounts. Also note that any losses incurred by companies from Hurricane Katrina in 2005 were not considered extraordinary because hurricanes are common on the Gulf Coast.

### Examples: Extraordinary and Nonextraordinary Items

In order to clarify further the distinction between extraordinary and nonextraordinary items, the following illustrations were presented in a separate pronouncement. **Events or transactions are reported as extraordinary items** when they meet both criteria, as in the following examples:

1. A large portion of a tobacco manufacturer's crops is destroyed by a hailstorm. Severe damage from hailstorms in the locality where the manufacturer grows tobacco is rare.
2. A steel-fabricating company sells the only land it owns. The land was acquired 10 years ago for future expansion, but shortly thereafter the company abandoned all plans for expansion and held the land for appreciation.
3. A company sells an investment in a block of common stock of a publicly traded firm. The block of shares, which represents less than 10% of the publicly held firm, is the only security investment the company has ever owned.
4. An earthquake destroys one of the oil refineries owned by a large multinational oil company.

**Events or transactions are *not* reported as extraordinary items** when they do not meet both criteria, as in these examples:

1. A citrus grower's Florida crop is damaged by frost. Frost damage is normally experienced every three to four years. The criterion of infrequency of occurrence, considering the environment in which the company operates, is not met because the history of losses caused by frost damage provides evidence that such damage may be expected to recur in the future.
2. A company that operates a chain of warehouses sells the excess land surrounding one of its warehouses. When the company buys property to establish a new warehouse, it usually buys more land than it expects to use for the warehouse expecting that the land will appreciate in value. In the past five years there have been two instances in which the company sold such excess land. The criterion of infrequency of occurrence is not met because past experience indicates that such sales may be expected to recur in the future.
3. A large diversified company sells a block of shares from a portfolio of securities that it acquired for investment purposes. This is the first sale from its portfolio of securities. Because the company owns several securities for investment purposes, sales of such securities are related to its ordinary and typical activities in the environment in which it operates, thus the criterion of unusual nature is not met.
4. A textile manufacturer with only one plant moves to another location. It has not relocated a plant in 20 years and has no plans to do so in the future. Even though the event is infrequent for this particular company, moving from one location to another is an occurrence that is a customary and continuing business activity. Therefore the criterion of unusual nature is not met.<sup>22</sup>

As in the case of discontinued operations, good judgment must be exercised in determining whether an item is extraordinary. ♦

### Reporting Procedures

Material extraordinary gains or losses are reported (net of income taxes) on a company's income statement below the results from discontinued operations (if any). Materiality of the gain or loss should be assessed in relation to income before extraordinary items, to trends

22. *Accounting Interpretations of APB Opinion No. 30* (New York: AICPA, 1973).

in this income, or by other appropriate criteria. The suggested format is as follows (using assumed amounts):

Income before extraordinary items	\$87,000
Extraordinary gain ... (net of \$4,800 income taxes, Note D)	<u>11,200</u>
Net income	<u>\$98,200</u>

If a company has more than one extraordinary item, *individual* extraordinary gains and losses should be disclosed in the income statement or in the notes to the financial statements. The income taxes applicable to the extraordinary items should be disclosed on the face of the income statement, although disclosure in the notes is acceptable. Either of these disclosure techniques requires intraperiod tax allocation. The Extraordinary Item section of the Banner Corporation income statement is shown earlier in Example 5-1 (the related income taxes were taken from Example 5-4). **CenterPoint Energy** reported an extraordinary item in 2004, as we show in Real Report 5-2.

### Real Report 5-2 Extraordinary Items

#### CENTERPOINT ENERGY, INC.

#### STATEMENTS OF CONSOLIDATED OPERATIONS (in part)

Years Ended December 31	2004
(thousands of dollars)	
Income before extraordinary loss	\$ 72,632
Extraordinary loss, net of income tax	<u>(977,336)</u>
Net income (loss)	<u>\$ (904,704)</u>

#### NOTES TO CONSOLIDATED FINANCIAL STATEMENTS (in part)

##### (4) REGULATORY MATTERS

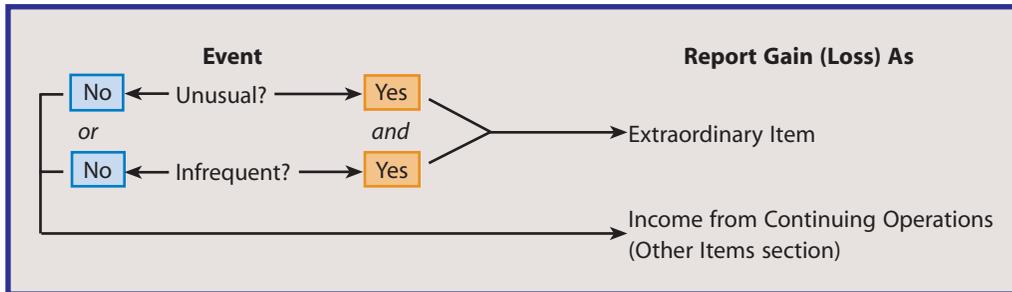

##### (a) 2004 True-up Proceeding

In March 2004, CenterPoint Houston filed the final true-up application required by the Texas electric restructuring law with the Public Utility Commission of Texas (Texas Utility Commission) (2004 True-Up Proceeding). CenterPoint Houston's requested true-up balance was \$3.7 billion. In December 2004, the Texas Utility Commission approved a final order in CenterPoint Houston's true-up proceeding (2004 Final Order) authorizing CenterPoint Houston to recover \$2.3 billion. As a result of the 2004 Final Order, the Company wrote-off net regulatory assets of \$1.5 billion and recorded a related income tax benefit of \$526 million, resulting in an after-tax charge of \$977 million, which is reflected as an extraordinary loss in the Company's Statements of Consolidated Operations. The Company recorded an expected loss of \$894 million in the third quarter of 2004 and increased this amount by \$83 million in the fourth quarter of 2004 based on the Company's assessment of the amounts ultimately recoverable. In January 2005, CenterPoint Houston appealed certain aspects of the final order seeking to increase the true-up balance ultimately recovered by CenterPoint Houston. Other parties have also appealed the order, seeking to reduce the amount authorized for CenterPoint Houston's recovery. Although CenterPoint Houston believes it has meritorious arguments and that the other parties' appeals are without merit, no prediction can be made as to the ultimate outcome or timing of such appeals.

#### Questions:

1. Why did CenterPoint Energy, Inc. have an extraordinary loss in 2004?
2. What was the pretax amount of the extraordinary loss? Provide an estimate of CenterPoint's tax rate.
3. If you were attempting to assess the operating performance of CenterPoint Energy, how would this extraordinary loss affect your evaluation?

The APB also addressed the disclosure of material gains and losses from events that are *either* unusual in nature *or* infrequent in occurrence, *but not both*. The examples cited earlier as events that are not extraordinary generally would fall into this category. The APB required that a company report material unusual or infrequent gains or losses as a separate component of income from continuing operations. We suggest including these items in the Other Items section, as we illustrated earlier. Because these items are a component of income from continuing operations, for which a related income tax expense is computed, unusual or infrequent gains or losses are *not* shown net of income taxes. The following diagram illustrates where to report gains and losses on a company's income statement:

While the interpretation of what is unusual and infrequent still requires professional judgment, it was the intent of the APB to reduce the number of extraordinary items. As a result of the issuance of *APB Opinion No. 30*, very few companies now report extraordinary items.

## INCOME STATEMENT: EARNINGS PER SHARE

Net income frequently is referred to as the "bottom line" on a company's income statement because it is the sum of income from continuing operations, the results from discontinued operations, and extraordinary items. Actually the term "bottom line" is misleading because **earnings per share information must be reported on a company's income statement, and this disclosure usually is shown directly below the net income.**

Earnings per share is an important ratio in financial analysis. It is often used to predict future earnings and dividends. It is also compared to the market price at which a stock currently is selling to determine the relative attractiveness of that stock. Earnings per share refers only to common stock. **In its simplest form, earnings per share is computed by dividing the net income by the number of common shares outstanding throughout the entire year.** Frequently companies refer to this as "basic earnings per share." However, many companies have preferred stock outstanding, which has first priority to dividends. They may also have some shares of common stock outstanding for only part of the year. Other companies have complex capital structures that include securities such as convertible preferred stock, convertible bonds, and stock (share) options that may be converted into shares of common stock. The conversion of these securities to common stock would affect the denominator (and in certain cases the numerator) of the earnings per share ratio. Therefore, companies with complex capital structures are required to disclose additional earnings per share information (called "diluted earnings per share"), as we discuss in Chapter 17.

All companies are required to report the earnings per share amounts relating to income from continuing operations and net income on their income statements. They are also required to report earnings per share amounts for the results from discontinued operations and extraordinary items on the income statement (or in a note to the financial

## LINK TO ETHICAL DILEMMA

Morgan Company, a newly-formed technology company, has recently taken advantage of low interest rates and replaced its 12% long-term debt with 8% long-term debt. This transaction, termed a refunding of debt, resulted in a \$25 million “paper” loss. As the accountant for Morgan Company, you inform the CEO that the loss should be classified as a component of income from continuing operations since such refundings are quite common to the industry in which Morgan Company operates and future predictions of decreases in interest rates are expected to lead to future refundings. While the CEO agrees that interest rates are likely to decrease, he notes that since this is the first debt refunding engaged in by Morgan Company, it is both an unusual and infrequent occurrence and should be classified as an extraordinary item. He informs you that he knows several other accountants who agree with his assessment and would love to have your job. He then instructs you to classify the loss as an extraordinary item. How would you classify the loss?

statements).<sup>23</sup> We suggest listing an earnings per share schedule that shows the per share amounts (after tax) for each of the major components of net income and sums to the per share amount related to net income. The schedule also should disclose the number of common shares used in the calculations. The format of this schedule is shown here (using assumed amounts and ignoring diluted earnings per share):

Net income	<u>\$42,600</u>
<b>Earnings per Common Share</b>	
<b>(10,000 common shares)</b>	
<hr/>	
Income from continuing operations	\$4.05
Results from discontinued operations	(0.63)
Extraordinary gain	<u>0.84</u>
Net income	<u>\$4.26</u>

A similar schedule is shown on the Banner Corporation income statement in Example 5-1. The earnings per share disclosure of **Lowe’s Companies, Inc.** is shown in Real Report 5-3.

## INCOME STATEMENT: RELATED ISSUES

There are several other important issues related to the items that a company reports on its income statement.

### Change in Accounting Estimate

Because companies present financial statements on a periodic basis, accounting estimates are necessary, and changes in these estimates frequently occur. Examples include changes

23. “Earnings per Share,” *FASB Statement of Financial Accounting Standards No. 128* (Norwalk, Conn.: FASB, 1997), par. 37.

## Real Report 5-3 Earnings Per Share

Diluted Earnings per Share	\$2.34	\$1.85	\$1.30
Cash Dividends Per Share	\$0.11	\$0.09	\$0.08

## Note 9 (in part)

## (In millions)

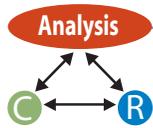

Basic Earnings per Share:	2003	2002	2001
Weighted Average Shares Outstanding	785	779	772
<b>Diluted Earnings per Share:</b>			
Dilutive Effect of Stock Options	4	4	7
Dilutive Effect of Convertible Debt	<u>17</u>	<u>17</u>	<u>16</u>
Weighted Average Shares, as Adjusted	806	800	795

## Questions:

1. How did the earnings from discontinued operations affect basic and diluted earnings per share for the year ended January 30, 2004?
2. What caused the adjustment in the weighted average number of shares in the calculation of diluted earnings per share?
3. What do you think about the trend in earnings per share over the time period presented? What are potential causes of this change in earnings per share?

in estimates of uncollectible receivables, inventory obsolescence, service lives and residual values of depreciable or depletable assets, and warranty costs. These changes may arise as a result of new events, as additional experience is acquired, or as more information is obtained. Note that they are *not* corrections of errors (which are prior period adjustments, discussed later), but instead are changes because of additional facts not known at the time the original estimate was made. **When a company changes an accounting estimate, it accounts for the change in the current year, and in future years if the change affects both.** For instance, suppose that in 2007, because of new information, a company determines that a machine it owns has a remaining life of five years instead of its original estimate of eight years. The company bases the depreciation on the machine in 2007 and future years on the shorter five-year life. As a result, the company reports a higher depreciation expense on its current and future income statements. It does *not* go back and correct its prior years' financial statements. However, in the year of the change in estimate a company includes a note to its financial statements that shows the effect of the change on that year's income before extraordinary items, net income, and

earnings per share. Thus, in this example, the company discloses the effect on each of these income items because of the increase in depreciation expense in a note to its 2007 financial statements.

### Summary of Selected Financial Information

As we discussed in Chapter 4 most companies present a summary of key financial information for a 5- to 10-year period in their annual report to help external users evaluate their performance. Frequently, ratios are included in this summary that either link income statement items or show a relationship between the income statement and balance sheet items. For instance, a company might report its *profit margin* ( $\text{net income} \div \text{net sales}$ ) to show its efficiency in controlling expenses in relation to sales. It might report the *return on stockholders' equity* ( $\text{net income} \div \text{average stockholders' equity}$ ) as a measure of the return provided to owners. (We discuss the profit margin and return on stockholders' equity ratios in Chapter 6.)

### Limitations of the Income Statement

As we mentioned at the beginning of the chapter, the income statement of a company is useful for evaluating management's performance, predicting future income, and assessing the company's creditworthiness. However, the income statement has several limitations, as follows:

1. Many of the expenses that are matched against revenues are based on an allocation of historical cost (e.g., depreciation expense) instead of "current value." As a result, it is argued that the net income does not adequately distinguish between a return *of* capital and a return *on* capital.
2. Many of the expenses (e.g., bad debts, warranties, and depreciation) are based on estimates that are subject to change and are less reliable.
3. In some cases companies may have too much leeway in selecting an accounting method (e.g., LIFO or FIFO for cost of goods sold), which leads to a lack of comparability across companies and may allow "earnings management."
4. Adherence to rigid accounting rules (e.g., recognizing revenue at the point of sale, expensing research and development costs when incurred) may lead to a distorted picture of a company's earnings activities.
5. The use of different formats (e.g., single-step versus multiple-step) by companies in the same industry may hide differences in operating results.
6. The use of "functional" classifications (e.g., selling and administration) for operating expenses instead of "activity" classifications (fixed, variable) may not provide sufficient information for predicting future cash outflows.

The FASB is aware of these limitations and either requires or encourages companies to disclose additional information in the notes or supplemental schedules to their financial statements to help users in their decision making.

## LINK TO INTERNATIONAL DIFFERENCES

International Accounting Standards require a company to use accrual accounting under the historical cost framework, considering economic substance instead of legal form. Therefore, U.S. and international accounting standards related to income are similar. In addition, much of a company's income statement content is similar in that international accounting standards require disclosure of revenues, operating expenses, finance costs, tax expense, income (loss) from ordinary activities, results of discontinued operations, extraordinary items, net income (loss), and earnings per share. A company is also required to disclose a form of comprehensive income. However, because it is difficult to obtain agreement on uniform international accounting standards, many of these standards allow a choice of alternative accounting treatments, thus leading to a lack of comparability. The IASB, in collaboration with several national accounting rule-making bodies, is working to eliminate these alternative treatments.<sup>24</sup> In addition, the IASB and the FASB currently are working on a joint project with regard to reporting financial performance and comprehensive income. The results of this project should result in convergence of IASB and FASB standards.

Currently, several differences exist between U.S. and international accounting standards. We discuss selected differences in later chapters as they relate to specific topics; we identify a few briefly here. For instance, under international accounting standards, a company may use either the percentage-of-completion or completed-contract method for long-term contracts, while U.S. standards specify the conditions for use of each method. Under international standards, a company may make adjustments to depreciation and cost of goods sold to reflect the effects of changing prices. Furthermore, as we discussed in Chapter 4, a company in a hyperinflationary economy is required to restate all revenues and expenses to reflect the general purchasing power and to include any purchasing power gain or loss on net monetary items in net income. The accounting for research and development costs may also differ between U.S. and international accounting standards. As we noted in Chapter 4, some foreign countries provide government grants to companies for compliance with certain conditions. When a company reports these grants as deferred income on its balance sheet, it recognizes them as income in later periods on a systematic and rational basis and includes the income as other income on its income statement. When it treats them as a reduction in the book value of an asset, it recognizes them in later periods on the income statement as a reduction in depreciation expense.

---

24. See K. Cearns, "Reporting Financial Performance: A Proposed Approach," *Special Report* (Norwalk, Conn.: FASB), 1999.

## SECURE YOUR KNOWLEDGE 5-2

- Income from continuing operations is a summary of the revenues, expenses (e.g., cost of goods sold, operating expenses, income tax expense), and other items that are expected to continue into the future.
- Income from continuing operations may be reported in a single-step format that classifies all items into either revenues or expenses, or it may be reported in a more useful multi-step format that contains additional classifications of the income statement elements.
- Discontinued operations (a component of a company's operations that has been, or will be, eliminated from ongoing operations) are reported net-of-tax directly after income from continuing operations.
- Extraordinary items, material gains or losses that are unusual in nature and infrequent in occurrence, are reported net-of-tax below the results of discontinued operations.
- Companies are required to report earnings per share amounts relating to income from continuing operations and net income on their income statements.
- The disclosure of additional information in the footnotes to the financial statements or in supplemental schedules is encouraged to overcome limitations of the income statement and provide external users with information useful for evaluating company performance.

## STATEMENT OF RETAINED EARNINGS

- 8 Prepare a statement of retained earnings.

Retained earnings is the link between a corporation's income statement and its balance sheet. Retained earnings is the total amount of corporate earnings that has not been returned to stockholders as dividends, and is a major component of stockholders' equity. Although *not* a required financial statement, whenever a corporation issues an income statement and a balance sheet, it may include a schedule that reconciles the beginning retained earnings balance with the ending retained earnings balance. This schedule is referred to as the **statement of retained earnings**. Because the all-inclusive concept of net income is used in the income statement, generally the retained earnings statement includes only the addition of net income to and the deduction of dividends from the beginning retained earnings balance. If a corporation has any retrospective adjustments or prior period adjustments, these are also included in the retained earnings statement.

### Net Income and Dividends

The two most common components of the statement of retained earnings are net income (loss) and dividends. The net income (loss) amount from the income statement is added to (subtracted from) adjusted beginning retained earnings. All dividends declared during the accounting period, including cash dividends on preferred stock and common stock, as well as any stock dividends (dividends involving the distribution of the company's own stock), are subtracted to determine the ending retained earnings balance. Typically, the cash dividends per share are disclosed parenthetically on the statement. Example 5-6 in the next section shows the net income and dividend components for the Banner Corporation.

### Adjustments of Beginning Retained Earnings

Sometimes a company must adjust its past financial statements. This means that the company must "restate" its financial statements of prior periods. There are two kinds of restatements.

The first is called *retrospective adjustment* and relates to a change in accounting principle. The FASB refers to this as a *retrospective application of a change in accounting principle*. For simplicity, in this chapter we will use the shorter term, *retrospective adjustment*. The second is called a *prior period adjustment* and relates to a correction of an error.

### Change in Accounting Principle

FASB Statement No. 154 deals with a change in accounting principle. A **change in accounting principle occurs when a company adopts a generally accepted accounting principle that is different from the one it has been using in its financial reporting**. Here the term “accounting principle” includes not only principles, but also the methods of applying them.<sup>25</sup> The consistent use of accounting principles from year to year improves intracompany comparability. Consequently, it is assumed that once a company adopts an accounting principle, it continues to use that principle for similar transactions. However, consistency does not stop a company from a change in accounting principle when this change results in more informative financial statements. A company must justify a voluntary change in accounting principle. An example of a change in accounting principle is when a company changes its method of inventory costing, such as from the first-in, first-out (FIFO) method to the average cost method.

In most cases, a change in accounting principle is accounted for by retrospective adjustment. That is, **for a change in accounting principle, a company reports the cumulative effect on prior years’ earnings as an adjustment of its beginning retained earnings balance for the earliest year presented**. Under this approach, the related existing asset or liability account balance (e.g., inventory) is recalculated. The new balance is determined assuming that the new accounting principle was applied during prior years. The account is debited or credited to bring its balance to the required amount, and the retained earnings account is credited or debited for the cumulative effect of the change in accounting principle. Any related impact on income taxes is also recorded. **The amount of the cumulative effect of the change in accounting principle is reported (net of taxes) directly after the beginning retained earnings amount on the company’s retained earnings statement**. Because accounting for a change in accounting principle is similar to a correction of an error, we do not discuss it further here. We discuss and illustrate the accounting procedures for a change in accounting principle in Chapter 23.

### Correction of an Error

FASB Statement No. 154 also addressed the correction of errors. In the *Statement* the FASB concluded that the correction of a material error in the financial statements of a prior period must be accounted for and reported as a prior period adjustment.<sup>26</sup>

A company occasionally may make an error in the financial statements of one accounting period that is not discovered until a later period. The error may be due to:

- a mathematical mistake,
- the incorrect use of existing facts,
- an oversight,
- the use of an accounting principle that is not generally accepted, or
- fraud

The correction of a material error is accounted for as a prior period adjustment to the beginning retained earnings balance in the period that the accounts are corrected. The asset or liability account in error at the beginning of the period is corrected, and the offsetting debit or credit amount is made directly to the retained earnings account.

25. “Accounting Changes and Error Corrections,” *FASB Statement No. 154* (Norwalk, Conn.: FASB, 2005), par. 2-18.

26. *Ibid.*, par. 25-26.

For example, suppose that during 2007 a company found it inadvertently had not recorded depreciation expense on a building in 2006. Thus, in 2006 its depreciation expense was too low, accumulated depreciation was too low, and net income (which was closed to retained earnings) was too high. The correction in 2007 includes a debit to retained earnings and a credit to accumulated depreciation for the amount of the misstated depreciation. Any related impact upon income taxes also is recorded. The company describes and reports the prior period adjustment (net of income taxes) as a decrease in the beginning retained earnings on its statement of retained earnings. As a result, the adjusted beginning retained earnings balance is the amount that retained earnings *would have been* if the error had not been made. If the company shows 2006 and 2007 comparative financial statements in 2007, it also makes corresponding adjustments to (i.e., it “restates”) its 2006 income statement and ending balance sheet. Corrections of material errors are relatively rare. The prior period adjustment for the Banner Corporation because of an error in counting the 2006 ending inventory is shown in Example 5-6 (using assumed amounts).

#### EXAMPLE 5-6 Statement of Retained Earnings

##### BANNER CORPORATION

##### Statement of Retained Earnings For Year Ended December 31, 2007

Retained earnings, January 1, 2007	\$68,150
Add: Prior period adjustment, correction of understatement of 2006 ending inventory (net of \$1,500 income taxes)	<u>3,500</u>
Adjusted retained earnings, January 1, 2007	\$71,650
Add: Net income	<u>10,850</u>
	\$82,500
Less: Cash dividends, \$0.50 per share	<u>(2,500)</u>
Retained earnings, December 31, 2007	<u>\$80,000</u>

### Combined Statements

The statement of retained earnings may be issued as a separate schedule. It may also be included either in a schedule that summarizes the changes in stockholders' equity or as a supporting schedule on the income statement directly below net income. Companies are required to disclose separately the changes in all the stockholders' equity accounts. When these disclosures are made in the statement of changes in stockholders' equity, the statement of retained earnings usually is included as part of this statement. We recommend either a separate retained earnings statement or inclusion in the statement of changes in stockholders' equity. We do not recommend reconciling the beginning and ending balances of the retained earnings account directly on the income statement. This would add unnecessary information to an already-complex financial statement and might confuse users about the amount of income reported by a company.

### COMPREHENSIVE INCOME

Earlier in the chapter we noted that the FASB generally follows the all-inclusive concept of net income. Over the years, however, a number of items of “income” emerged that were not included in the income statement. Generally, companies reported the *total* of these items as a component of stockholders' equity, and disclosed the *change* in them in the

notes to their financial statements. Some users of financial statements expressed concern that the changes in these items were “hidden” so that it was difficult to assess the timing and size of a company’s future cash flows as they relate to issues such as its risk, financial flexibility, and operating capability.

In response to these users’ concerns, the FASB requires companies to report their comprehensive income (or loss) for the accounting period. **A company’s comprehensive income consists of two parts: net income and other comprehensive income.** Currently, there are four items of a company’s other comprehensive income:

- any unrealized increase (gain) or decrease (loss) in the market (fair) value of its investments in available-for-sale securities,
- any change in the excess of its additional pension liability over unrecognized prior service cost,
- certain gains and losses on “derivative” financial instruments, and
- any translation adjustment from converting the financial statements of its foreign operations into U.S. dollars.

We discuss the first three items later in the book; the last item is discussed in an advanced accounting book. If a company has no items of other comprehensive income, then it does not have to report comprehensive income.

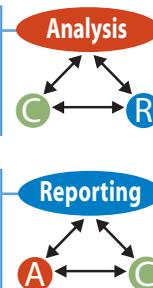

The FASB allows a company to report its comprehensive income (or loss) under three alternatives:

1. On the face of its income statement
2. In a separate statement of comprehensive income
3. In its statement of changes in stockholders’ equity

Whichever financial statement a company uses to report its comprehensive income, the company must display that statement as a *major* financial statement in its annual report. In reporting its comprehensive income, a company must add its other comprehensive income to its net income. The other comprehensive income items may be reported at their gross amounts or net of tax. If each item is reported at its gross amount, then the total pretax amount of other comprehensive income must be reduced by the related income tax expense, and the amount of tax applicable to each item must be reported in the notes to the financial statements. A company is not required to report earnings per share on its comprehensive income.<sup>27</sup>

## Reporting Alternatives

To illustrate the alternative reporting formats, assume that at the beginning of 2007 the Sara Company’s stockholders’ equity was as follows: common stock (\$10 par, 7,000 shares), \$70,000; additional paid-in capital, \$50,000; and retained earnings, \$80,000. During 2007, the company had revenues of \$60,000 and expenses of \$40,000, and the income tax rate was 30%. It also issued 2000 shares of its \$10 par common stock for \$38,000 and paid dividends of \$5,000. During 2007, the company invested \$21,000 in available-for-sale securities, and at the end of the year the securities have a market value of \$26,000 which it reports on its ending 2007 balance sheet. So the company records a \$5,000 unrealized increase in the value of these securities.<sup>28</sup> The company reports its other comprehensive income net of tax.

27. “Reporting Comprehensive Income,” *FASB Statement of Financial Accounting Standards No. 130* (Norwalk, Conn.: FASB, 1997), par. 15–25.

28. If the company sold some of these securities during the year and recorded a realized gain or loss on these securities, then it would record and report a “reclassification adjustment” as part of its other comprehensive income. We discuss this adjustment in Chapter 15.

**Alternative 1**

If Sara Company reports its comprehensive income on the income statement, its condensed statement of income and comprehensive income for 2007 would appear as follows:

*Statement of Income and Comprehensive Income*

Revenues	\$60,000
Expenses	<u>(40,000)</u>
Income before income taxes	\$20,000
Income tax expense	<u>(6,000)</u>
Net income	\$14,000
Other comprehensive income:	
Unrealized increase in value of available-for-sale securities (net of \$1,500 income taxes)	<u>3,500</u>
Comprehensive income	<u><u>\$17,500</u></u>

**Alternative 2**

If Sara Company reports its comprehensive income on a separate statement of comprehensive income, its income statement for 2007 would show net income of \$14,000. Its statement of comprehensive income for 2007 would appear as follows:

*Statement of Comprehensive Income*

Net income	\$14,000
Other comprehensive income	
Unrealized increase in value of available-for-sale securities (net of \$1,500 income taxes)	<u>3,500</u>
Comprehensive income	<u><u>\$17,500</u></u>

**Alternative 3**

If Sara Company reports its comprehensive income on its statement of changes in stockholders' equity, its income statement for 2007 would show net income of \$14,000. Its statement of changes in stockholders' equity for 2007 would appear as follows:

*Statement of Changes in Stockholders' Equity*

	Comprehensive Income	Common Stock, \$10 par	Additional Paid-in Capital	Retained Earnings	Accumulated Other Comprehensive Income	Total
Balances, January 1, 2007		\$70,000	\$50,000	\$80,000	\$ 0	\$200,000
Comprehensive income						
Net income	\$14,000			14,000		14,000
Other comprehensive income						
Unrealized increase in value of available-for-sale securities (net of \$1,500 income taxes)	<u>3,500</u>				3,500	3,500
Comprehensive income	<u><u>\$17,500</u></u>					
Cash dividends paid				(5,000)		(5,000)
Common stock issued		<u>20,000</u>	<u>18,000</u>			<u>38,000</u>
Balances, December 31, 2007		<u><u>\$90,000</u></u>	<u><u>\$68,000</u></u>	<u><u>\$89,000</u></u>	<u><u>\$3,500</u></u>	<u><u>\$250,500</u></u>

Sara Company would report the \$3,500 *total* unrealized increase in the value of its investments in available-for-sale securities as accumulated other comprehensive income

in the stockholders' equity section of its December 31, 2007 balance sheet, as we discussed in Chapter 4.

We show the relationship of a company's comprehensive income (or loss) components and its "flow" into the company's balance sheet accounts in the following diagram:

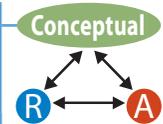

Beginning Retained Earnings	+ (–) Net Income (Loss)	– Dividends = Ending Retained Earnings
Beginning Accumulated Other Comprehensive Income (Loss)	+ (–) Other Comprehensive Income (Loss)	= Ending Accumulated Other Comprehensive Income (Loss)
	Comprehensive Income (Loss)	

Currently, about 84% of surveyed companies report their comprehensive income in the statement of changes in stockholders' equity, while 12% report it in a separate statement of comprehensive income and only 4% report it on a statement of income and comprehensive income.<sup>29</sup>

**General Motors Corporation** reports its comprehensive income in its statement of stockholders' equity. For 2004, it reported net income of \$2,805 million and reported an other comprehensive loss of \$2,885 million. The other comprehensive loss included a \$1,194 million loss from foreign currency translation adjustments, a \$307 million loss on derivatives, a \$751 million unrealized gain on securities, and a \$3,031 million loss on its minimum pension liability adjustment.

### Conceptual Evaluation

In the *Exposure Draft for FASB Statement No. 130*, the Board planned to require companies to report comprehensive income in one or two statements of financial performance (i.e., types of "income statements"), and to report a per share amount for comprehensive income. Many companies and users of these statements objected to the FASB's approach for several reasons. First, they argued that reporting both net income and comprehensive income on one income statement would result in reduced *understandability*—that users would not be able to determine which measure is appropriate for investment and credit decisions or capital resource allocation. Second, they argued that the items of other comprehensive income are not "performance related" and it would not be *relevant* to include them on an income statement. Third, some argued that comprehensive income would be volatile from period to period and that this volatility would be related to market forces beyond the control of a company's management. Finally, they argued that requiring the reporting of a per share amount for comprehensive income would be confusing and lead to a lack of *comparability*, because some analysts would quote earnings per share while other analysts would quote comprehensive income per share. The FASB responded to these criticisms by allowing flexibility in reporting comprehensive income and by not requiring the reporting of the related per share amount. Because of this flexibility, many companies report their comprehensive income in their statement of changes in stockholders' equity and display this statement as a major financial statement in their annual reports.

## STATEMENT OF CASH FLOWS

Traditionally, every company prepared an income statement for its accounting period and a balance sheet at the end of the period. The income statement reported the profitability of its operating activities while the balance sheet reported its ending financial position. Many external users asked questions about a company's "funds" flows, such as

**10** Explain the statement of cash flows.

29. *Accounting Trends and Techniques* (New York: AICPA, 2004), p. 451.

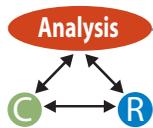

how were funds from operations generated? How was expansion financed? How was long-term debt retired? What happened to the proceeds from the issuance of capital stock? These questions could not be answered directly from the income statement or the balance sheet information. The APB realized that a gap existed in the reporting of a company's financial activities, and issued *APB Opinion No. 19*. This *Opinion* required that a company prepare a statement of changes in financial position along with its balance sheet and income statement. The *Opinion* permitted companies flexibility in their choice of the definition of funds, classifications, and formats of the statement. Over the years, external users expressed concern that differences in the focus of the statement, definitions of funds from operating activities, classifications of funds flows, and formats of the statement caused a lack of comparability across companies. They also recognized the importance of information about a company's *cash flows*.

As a result, **FASB Statement No. 95**, "Statement of Cash Flows," was issued. This *Statement* requires that **a company present a statement of cash flows for the accounting period along with its income statement and balance sheet**. The primary purpose of a statement of cash flows is to provide relevant information about a company's cash receipts and cash payments during an accounting period. Therefore, the statement of cash flows provides information about the cash effects of a company's operating, investing, and financing activities during an accounting period. Because this statement is related to the other financial statements and is an integral part of a company's annual report, we briefly discuss it next. We fully discuss the preparation of the statement of cash flows in Chapter 22.

## Overview and Uses of the Statement of Cash Flows

In Chapter 2 we noted that one of the specific objectives of financial reporting is to provide information about a company's cash flows. The statement of cash flows is useful in meeting this objective. Furthermore, external users are interested in information from the statement of cash flows to assess a company's **liquidity** (the nearness to cash of its assets and liabilities), **financial flexibility** (its ability to adapt to unexpected needs and opportunities), and **operating capability** (its ability to maintain a given physical level of operations). When used with a company's other financial statements, **the statement of cash flows helps external users assess:**

1. The company's ability to generate positive future cash flows
2. The company's ability to meet its obligations and pay dividends
3. The company's need for external financing
4. The reasons for differences between the company's net income and associated cash receipts and payments
5. Both the cash and noncash aspects of the company's investing and financing transactions during the accounting period<sup>30</sup>

## Reporting Guidelines and Practices

To aid external users in making the preceding assessments, *FASB Statement No. 95* requires that **a statement of cash flows must report on a company's cash inflows, cash outflows, and net change in cash from its operating, investing, and financing activities during the accounting period, in a manner that reconciles the beginning and ending cash balances**. This reconciliation causes the statement of cash flows to **articulate with the balance sheet**.

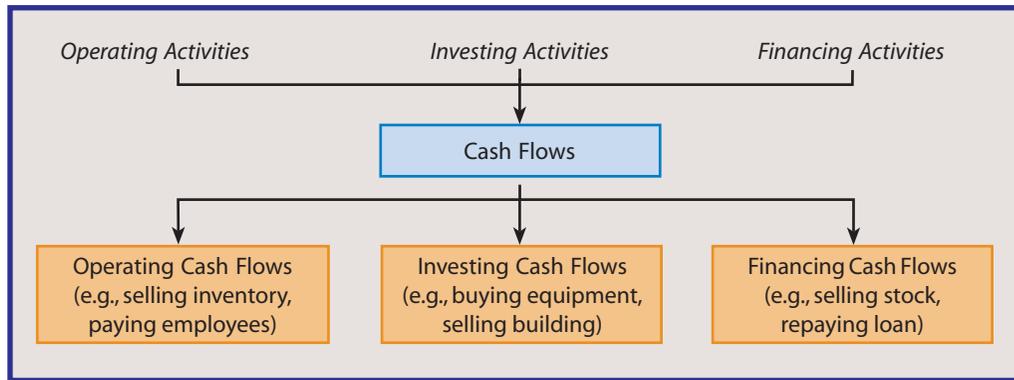

A company's *operating activities* include all the transactions and other events related to its earning process, such as those involved in purchasing, producing, selling, and delivering

30. "Statement of Cash Flows," *FASB Statement of Financial Accounting Standards No. 95* (Stamford, Conn.: FASB, 1987), par. 3–6.

goods for sale, as well as providing services. *Investing activities* include transactions involving buying and selling property, plant, and equipment; buying and selling long-term investments; and lending money and collecting on the loans. *Financing activities* include transactions involved in obtaining resources from owners and paying dividends, as well as obtaining resources from creditors and repaying the amounts borrowed.

These activities generate cash flows (inflows and outflows) that can be categorized according to each activity as follows:

This categorization is used in the statement of cash flows.

The statement of cash flows of a company includes three major sections: (1) net cash flow from operating activities, (2) cash flows from investing activities, and (3) cash flows from financing activities.<sup>31</sup> The **Net Cash Flow from Operating Activities** section reports the cash flows from the operating activities of the company. The most common way to prepare this section is called the *indirect method*.<sup>32</sup> Under this method, net income is listed first and then adjustments (additions or subtractions) are made to net income:

1. To eliminate certain amounts, such as depreciation expense and gains (losses), that were included in net income but that did not involve a cash inflow or cash outflow for operating activities
2. To include any changes in the current assets (other than cash) and current liabilities involved in the company's operating cycle that affected cash flows differently than net income

These adjustments are made to convert the net income to the net cash provided by (or used in) operating activities. The indirect method has the advantage of showing the "quality" of income by providing information about differences between income flows and operating cash flows.

The **Cash Flows from Investing Activities** section includes all the cash inflows and outflows involved in the investing activities transactions of the company. The most common cash inflows (receipts) from and cash outflows (payments) for investing activities are:

1. Receipts from selling property, plant, and equipment
2. Receipts from selling investments in stocks and debt securities (e.g., bonds)
3. Payments for purchases of property, plant, and equipment
4. Payments for investments in stocks and debt securities

Similarly, the **Cash Flows from Financing Activities** section includes all the cash inflows and cash outflows involved in the financing activities transactions of the company. The

**11** Classify cash flows as operating, investing, or financing.

31. Transactions involving investing and financing activities that *do not* affect cash receipts or cash payments also are included in a separate schedule accompanying the statement of cash flows. We discuss this schedule in Chapter 22.

32. According to *Accounting Trends and Techniques* (New York: AICPA, 2004, p. 549), over 98% of surveyed companies use the indirect method.

most common cash inflows (receipts) from and cash outflows (payments) for financing activities are:

1. Receipts from the issuance of debt securities (e.g., bonds, mortgages, notes)
2. Receipts from the issuance of stocks
3. Payments of dividends
4. Payments to retire debt securities
5. Payments to reacquire stock (i.e., treasury stock)

To complete the statement of cash flows, the cash inflows and outflows within each section are subtotaled, the subtotals are summed to determine the net increase (or decrease) in cash of the company during the accounting period, and the net change in cash is added to or subtracted from the beginning cash balance to reconcile to the ending cash balance reported on the company's year-end balance sheet.<sup>33</sup>

### Example: Statement of Cash Flows

Example 5-7 shows the statement of cash flows of the Trevor Corporation for 2007 (using the *indirect* method for operating activities). The statement of cash flows of the **Coca-Cola Company**, as presented in its 2004 annual report, is shown in Appendix A. Note in Example 5-7 that the Trevor Corporation had a net cash inflow of \$70,400 from its *operating activities* in 2007. This amount was determined by adjusting the \$59,600 net income for several differences between its income flows and cash flows. For instance, depreciation expense of \$16,500 was "added back" to net income because it had been deducted as an expense on the income statement but there was no cash outflow. On the other hand, the \$1,800 increase in accounts receivable was subtracted because this increase resulted from credit sales, which increased sales revenue (and net income) on the income statement, but provided no cash inflow at the time of the sale. The other adjustments to net income were made for similar reasons, as we discuss more fully in Chapter 22.

The net cash used for *investing activities* was \$78,900. The cash outflows were for the purchase of a building and for an investment in bonds. The cash inflow was from the sale of land. The net cash provided by *financing activities* was \$16,600. The cash outflows were for the payment of dividends and a mortgage. The cash inflow was from the issuance of common stock.

The \$8,100 net increase in cash was determined by adding the \$70,400 net cash provided by operating activities and the \$16,600 net cash provided by financing activities, and subtracting the \$78,900 net cash used for investing activities. The \$8,100 net increase in cash was added to the \$17,200 cash balance on January 1, 2007 to reconcile to the \$25,300 cash balance on December 31, 2007. ♦

### Operating Cash Flows: Direct Method

The other way to report cash flows from operating activities is the *direct method*. In *FASB Statement No. 95*, the FASB encourages use of the direct method. This method has the advantage of separating operating cash inflows from operating cash outflows, which may be useful in estimating future cash flows. Under the direct method, a company's operating cash inflows are listed first. The operating cash outflows are then deducted from the operating cash inflows to determine the net cash provided by (or used in) operating activities. The most common cash inflows from and cash outflows for operating activities are as follows:

#### Operating Cash Inflows

1. Collections from customers
2. Interest and dividends collected

#### Operating Cash Outflows

1. Payments to suppliers and employees
2. Payments of interest
3. Payments of income taxes

33. As we noted in Chapter 4, a company may report cash and cash equivalents on its balance sheet. In this case, the reconciliation on the statement of cash flows is to the ending cash and cash equivalents.

**EXAMPLE 5-7 Statement of Cash Flows****TREVOR CORPORATION****Statement of Cash Flows  
For Year Ended December 31, 2007****Net Cash Flow From Operating Activities**

Net income	\$ 59,600	
Adjustments for differences between income flows and cash flows from operating activities:		
Add: Depreciation expense	16,500	
Amortization expense	2,000	
Bond discount amortization	1,100	
Decrease in prepaid items	400	
Increase in salaries payable	700	
Increase in income taxes payable	2,200	
Increase in deferred income taxes	900	
Less: Increase in accounts receivable (net)	(1,800)	
Increase in inventories	(7,300)	
Decrease in accounts payable	(2,600)	
Decrease in advances from customers	<u>(1,300)</u>	
Net cash provided by operating activities		\$70,400

**Cash Flows From Investing Activities**

Payment for purchase of building	\$(73,900)	
Payment for investment in bonds	(10,000)	
Receipt from sale of land	<u>5,000</u>	
Net cash used for investing activities		(78,900)

**Cash Flows From Financing Activities**

Payment of dividends	\$(12,400)	
Payment of mortgage	(14,000)	
Receipt from issuance of common stock	<u>43,000</u>	
Net cash provided by financing activities		<u>16,600</u>
Net Increase in Cash		\$ 8,100
Cash, January 1, 2007		17,200
Cash, December 31, 2007		<u>\$25,300</u>

Cash Flows from  
Operating ActivitiesCash Flows from  
Investing ActivitiesCash Flows from  
Financing Activities

Reconciliation

If the Trevor Corporation used the direct method *instead* of the indirect method, the operating cash flows section of Example 5-6 would be as follows:

**Cash Flows From Operating Activities****Cash Inflows:**

Collections from customers	\$ 248,100	
Interest and dividends collected	<u>3,800</u>	
Cash inflows from operating activities		\$251,900

**Cash Outflows:**

Payments to suppliers and employees	\$(143,600)	
Payments of interest	(17,200)	
Payments of income taxes	<u>(20,700)</u>	
Cash outflows for operating activities		<u>(181,500)</u>
Net cash provided by operating activities		\$ 70,400

Note that the \$70,400 reported as the net cash provided by operating activities is the same under the direct and indirect methods, only the approach to determining the amount is different. The remainder of the statement of cash flows is the same under either method. You should use the *indirect* method for all homework, unless indicated otherwise.

### SECURE YOUR KNOWLEDGE 5-3

- The statement of retained earnings reports the changes in the balance of retained earnings which are caused by net income or loss, dividends, retrospective adjustments, and prior period adjustments.
- A retrospective adjustment is a restatement of the beginning balance of retained earnings because of a change in accounting principle.
- A prior period adjustment is a restatement of the beginning balance of retained earnings because of a correction of an error.
- Comprehensive income, the change in equity during a period from nonowner sources, includes both net income and other comprehensive income.
- The statement of cash flows provides information about a company’s cash inflows and cash outflows during a period by classifying the cash flows into one of three categories: operating, investing, or financing activities.

## SUMMARY OF DISCLOSURES

In this chapter we discussed the conceptual issues and disclosure requirements of numerous complex items concerning corporate earnings and cash flows. Exhibit 5-3 presents a brief summary of the most important items, conceptual criteria, disclosure requirements, and related pronouncements for material items. You should review the specific related pronouncements for a complete technical discussion of each topic.

**EXHIBIT 5-3** Summary of GAAP for Comprehensive Income and Cash Flows

Item	Criteria	Disclosure	Pronouncement
Income from continuing operations	Revenues and expenses related to usual and recurring operating activities	Upper portion of income statement. Multiple- or single-step format.	APB Opinion No. 30
Nonextraordinary gains or losses	Either unusual in nature or infrequent in occurrence but not both	In income from continuing operations (Other Items) on income statement.	APB Opinion No. 30
Results from discontinued operations	Sale of a component of a company	On income statement, directly below income from continuing operations. Include (1) gain or loss on sale, and (2) income or loss from operations of discontinued component. Show both net of income taxes.	FASB Statement No. 144

## EXHIBIT 5-3 (Continued)

Item	Criteria	Disclosure	Pronouncement
Extraordinary gains or losses	Unusual in nature and infrequent in occurrence	On income statement, directly below results from discontinued operations. Show net of income taxes.	APB Opinions No. 9 and 30; FASB Statements No. 4 and 145
Earnings per share	Net income and components divided by number of common shares outstanding	On income statement, directly below net income. Show earnings per share related to net income and each major component of net income.	APB Opinions No. 20 and 30; FASB Statement No. 128
Cumulative effect of change in accounting principle	Adoption of a generally accepted accounting principle different from one previously used	On statement of retained earnings as retrospective adjustment to beginning retained earnings. Show net of income taxes.	FASB Statement No. 154
Correction of error	Correction of a material error in financial statements of a prior period	On statement of retained earnings as prior period adjustment to beginning retained earnings. Show net of income taxes.	FASB Statements No. 16 and 154
Comprehensive income	Net income plus other comprehensive income	On income statement, statement of comprehensive income, or statement of changes in stockholders' equity.	FASB Statement No. 130
Operating cash flows	Cash flows related to earning process	First section on statement of cash flows.	FASB Statement No. 95
Investing cash flows	Cash flows from lending activities, and from buying and selling noncurrent assets	Second section on statement of cash flows.	FASB Statement No. 95
Financing cash flows	Cash flows from issuing and reacquiring debt and equity securities, and for paying dividends	Third section on statement of cash flows.	FASB Statement No. 95

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

1. **Understand the concepts of income.** Under the capital maintenance concept of income, a corporation's capital (net assets) must be maintained before the corporation earns income on that capital. But the corporation's total income is not very useful in evaluating its operating activities. To improve the usefulness of its income information, a corporation uses accrual accounting, under the transactional approach, to match its accomplishments with its efforts in order to provide information about the corporation's comprehensive income and its components.

2. **Explain the conceptual guidelines for reporting income.** Some general guidelines are to provide information about a company's operating performance that is useful in (1) predicting future income and cash flows, (2) assessing the return on the investment, (3) providing feedback to assess previous predictions, (4) assessing the cost of maintaining its operating capability, and (5) evaluating management's stewardship.
3. **Define the elements of an income statement.** The elements of an income statement are the broad classes of items comprising it. The elements include revenues, expenses, gains, and losses. Briefly, revenues result from sales of goods or services, while expenses result from providing the goods or services. Gains (losses) are increases (decreases) in a company's equity from other events and circumstances.
4. **Describe the major components of an income statement.** The major components of an income statement are: (1) income from continuing operations, (2) results from discontinued operations, (3) extraordinary items, (4) net income, and (5) earnings per share.
5. **Compute income from continuing operations.** Income from continuing operations starts with net sales. Cost of goods sold is deducted from net sales to determine gross profit. Total operating expenses (consisting of selling expenses and general and administrative expenses) are deducted from gross profit to determine operating income. The total of any other items is added to (or deducted from) operating income to determine pretax income from continuing operations, from which income tax expense is deducted to determine income from continuing operations.
6. **Compute results from discontinued operations.** The results of discontinued operations consists of the sum of two items: (1) the income from operations of the discontinued component during the accounting period, and (2) the gain (or loss) from the disposal of the component. These items are reported net of taxes.
7. **Identify extraordinary items.** An extraordinary item is an event or a transaction that is both unusual in nature and infrequent in occurrence. Briefly, unusual in nature refers to a high degree of abnormality, while infrequent in occurrence refers to an expectation that the event or transaction will not recur in the foreseeable future.
8. **Prepare a statement of retained earnings.** A statement of retained earnings starts with the beginning balance in retained earnings. Any retrospective adjustment or prior period adjustment (net of taxes) is added or subtracted to determine the adjusted beginning retained earnings. Net income is then added and dividends are subtracted to determine the ending balance in retained earnings.
9. **Report comprehensive income.** A company's comprehensive income is the sum of its net income and other comprehensive income [e.g., unrealized increase (decrease) in market value of its investments in available-for-sale securities]. A company may report its comprehensive income on the face of its income statement, in a separate statement of comprehensive income, or in its statement of changes in stockholders' equity.
10. **Explain the statement of cash flows.** A company's statement of cash flows reports on its cash inflows, cash outflows, and net change in cash from its operating, investing, and financing activities during the accounting period, in a manner that reconciles the beginning and ending cash balances. Its purpose is to help users assess a company's liquidity, financial flexibility, and operating capability.
11. **Classify cash flows as operating, investing, or financing.** A company's operating cash flows result from all the transactions and other events related to its earning process. Its investing cash flows are the cash inflows and outflows resulting from its investing activities (e.g., purchasing equipment). Its financing cash flows are the cash inflows and outflows resulting from its financing activities (e.g., issuing bonds).

## ANSWERS TO REAL REPORT QUESTIONS

### Real Report 5-1 Answers

1. In 2004, Pfizer disposed of (1) certain European pharmaceutical businesses that were part of the Human Health segment, (2) certain non-core consumer product lines in the Consumer Healthcare segment, (3) its surgical ophthalmic business, and (4) its in-vitro allergy and autoimmune diagnostics testing business.
2. The pretax loss in 2004 from discontinued operations was \$39 million; however, Pfizer was able to earn pretax income in 2003 from discontinued operations of \$43 million. A company may dispose of components of its business for several reasons, including inadequate or uncertain future prospects, unsatisfactory contribution to earnings or cash flows, and lack of fit with regard to a company's strategic plan.

3. External users are concerned with predicting the amounts, timing, and uncertainty of a company's future earnings and cash flows. Because discontinued operations will not be present in the future, any income or loss associated with discontinued operations should not be used in the calculation of a company's return on assets. Given the information provided, income from continuing operations of \$11,332 million is the most appropriate income measure to use for this calculation.

### Real Report 5-2 Answers

1. CenterPoint Energy's extraordinary loss was due to the write off of net regulatory assets because of an adverse judgment by the Texas Utility Commission. CenterPoint had sought to recover costs of approximately \$3.7 billion

- but the Texas Utility Commission authorized the recovery of \$2.3 billion. This decision is being appealed.
- The pretax amount of the extraordinary loss was \$1.5 million. Because the tax benefit related to the loss was \$526 million, CenterPoint's estimated tax rate is 35% (\$526 million / \$1.5 million).
  - While CenterPoint did experience a net loss for the year of \$904,704 million, this was due to the extraordinary loss. Excluding this loss, CenterPoint actually reported income of \$72,632 million. Because the company has limited control over a loss that is both unusual in nature and infrequent in occurrence, this loss will not generally be considered in evaluating operating performance.
  - Lowe's possesses a complex capital structure that contained stock options and debt that is convertible into shares of common stock. Diluted earnings per share captures the potential decrease in earnings per share assuming these securities were converted into common stock.
  - Basic and diluted earnings per share increased by \$1.06 and \$1.04, respectively, over the time period presented. The steady increase in earnings per share, coupled with the large increases in earnings over the period, would most likely be viewed favorably by analysts. While not reported in the text, Lowe's was able to increase gross margin approximately 2% over the period presented. It is this increased margin that was the most significant contributor to Lowe's bottom line.

### Real Report 5-3 Answers

- Earnings from discontinued operations, \$15 million for the year ended January 30, 2004, increased basic and diluted earnings per share by \$0.02 per share.

## QUESTIONS

- Q5-1** Define income under the "capital maintenance" concept. Identify the alternative ways of measuring capital under this concept.
- Q5-2** Briefly discuss the transactional approach to income measurement. Explain its relationship (if any) to the capital maintenance concept of income.
- Q5-3** Define comprehensive income. What was the intent of the FASB in developing this conceptual definition?
- Q5-4** Discuss (a) return on investment, (b) risk, (c) financial flexibility, and (d) operating capability.
- Q5-5** What are the purposes of the income statement?
- Q5-6** List the specific conceptual guidelines suggested by the FASB for reporting (presenting) revenues, expenses, gains, and losses.
- Q5-7** Define revenues. What operating activities are likely to result in revenues?
- Q5-8** What two criteria must ordinarily be met for revenues to be recognized? When does a company usually recognize revenue?
- Q5-9** Why might revenue be recognized at a time other than the sale? What are the alternative revenue recognition methods and for what might they be used?
- Q5-10** Define expenses. Of what are expenses a measurement?
- Q5-11** What are three principles for recognizing the expenses to be matched against revenues? Give examples of expenses that would be recognized under each principle.
- Q5-12** Define gains and losses. Give examples of three different types of gains and losses.
- Q5-13** What items are included in a company's "income from continuing operations"? How are these categorized if the company uses (a) a single-step format, or (b) a multiple-step format?
- Q5-14** Discuss the difference between the "current operating performance" and the "all-inclusive" concepts of net income. Which concept is currently used?
- Q5-15** What elements are listed as Other Items on a company's income statement?
- Q5-16** What is intraperiod tax allocation and why is it necessary? How is the income tax expense related to each major component of income disclosed on the income statement?
- Q5-17** What items are included in a company's results from discontinued operations? For this purpose, how is a "component" defined?
- Q5-18** How is an extraordinary item defined? Explain the two criteria that must be met to classify an event as extraordinary. Give two examples of gains or losses from extraordinary items.
- Q5-19** How are gains or losses that are either unusual or infrequent reported on a company's income statement?
- Q5-20** Why do changes in accounting estimates arise? Give examples of a change in accounting estimate and indicate how such a change should be accounted for.
- Q5-21** Where is earnings per share disclosed in a company's financial statements? What components of earnings per share should be disclosed?
- Q5-22** Briefly list several differences between international and U.S. accounting standards in regard to a company's income statement.

**Q5-23** What items are included in a company's statement of retained earnings?

**Q5-24** What is a change in accounting principle and how is it reported on a company's statement of retained earnings?

**Q5-25** What are the possible causes of an error in a company's financial statements? How is the correction of a material error accounted for and how is the correction reported on the financial statements?

**Q5-26** What is included in a company's comprehensive income? Currently, what are the four items of a company's other comprehensive income?

**Q5-27** Where does a company report its comprehensive income?

**Q5-28** What is a statement of cash flows? What are the three major sections of the statement?

**Q5-29** When used with a company's other financial statements, what does the statement of cash flows help external users assess?

**Q5-30** What are the three types of activities that a statement of cash flows reports on for a company? Provide examples of transactions for each type of activity.

**Q5-31** Under the indirect method, how is the net cash provided by operating activities determined in a company's statement of cash flows?

**Q5-32** Under the direct method, what are the most common cash inflows from and the most common cash outflows for operating activities in a company's statement of cash flows?

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

**M5-1** The following information is available for Cooke Company for the current year:

Net sales	\$1,800,000
Freight-in	45,000
Purchases discounts	25,000
Ending inventory	120,000

The gross margin is 40% of net sales. What is the cost of goods available for sale?

- a. \$840,000
- b. \$960,000
- c. \$1,200,000
- d. \$1,220,000

**M5-2** A transaction that is material in amount, unusual in nature, and infrequent in occurrence is presented in the income statement separately as a component of income

- a. Net of applicable income taxes
- b. As a prior period adjustment
- c. From continuing operations
- d. From discontinued operations

**M5-3** Effective January 1, 2007, Younger Company adopted the accounting principle of expensing as incurred advertising and promotion costs. Previously, advertising and promotion costs applicable to future periods were recorded in prepaid expenses. Younger can justify the change, which was made for both financial statement and income tax reporting purposes. Younger's prepaid advertising and promotion costs totaled \$500,000 at December 31, 2006. Assume that the income tax rate is 30% for 2006 and 2007. The adjustment for the effect of this change in accounting principle should result in a net adjustment in the 2007 retained earnings statement of

- a. \$0
- b. \$150,000
- c. \$350,000
- d. \$500,000

**M5-4** A company changes from the first-in, first-out inventory method to the average cost method. The cumulative effect of the change on the amount of retained earnings at the beginning of the period in which the change is made is reported separately as a(n)

- a. Extraordinary item
- b. Component of income from discontinued operations
- c. Component of income from continuing operations
- d. Retrospective adjustment

**M5-5** Palo Corporation incurred the following losses, net of applicable income taxes, for the year ended December 31, 2007:

Loss on disposal of a component of Palo's business	\$400,000
Loss on translation of foreign currency because of devaluation	500,000

How much should Palo report as extraordinary losses on its 2007 income statement?

- a. \$0
- b. \$400,000
- c. \$500,000
- d. \$900,000

**M5-6** Which of the following is expensed under the principle of systematic and rational allocation?

- a. Salespeople's monthly salaries
- b. Insurance premiums
- c. Transportation to customers
- d. Electricity to light office building

**M5-7** The following information is available for Wagner Corporation for the current year:

Sales	\$500,000
Beginning inventory	180,000
Ending inventory	95,000
Freight-out	45,000
Purchases	215,000

**E5-4 Classifications** Where would each of the following items most likely be reported in a company's financial statements? Assume the monetary amount of each item is material and the company uses a periodic inventory system.

- |  |  |
|--|--|
| 1. Loss on sale of equipment   | 9. Summary of accounting policies  |
| 2. Office supplies used  | 10. Purchases returns and allowances                                     |
| 3. Correction of miscount of last year's ending finished goods inventory | 11. Income tax expense on continuing income                              |
| 4. Freight-in  | 12. Stock dividend   |
| 5. Delivery expense  | 13. Loss resulting from tornado damage                                   |
| 6. Dividend revenue  | 14. Merchandise inventory (ending)                                       |
| 7. Gain from retirement of debt  | 15. Unrealized decrease in market value of available-for-sale securities |
| 8. Change in the estimated useful life of office equipment               |  |

**E5-5 Multiple-Step and Single-Step Income Statements** Included in the December 31, 2007 adjusted trial balance of the Gold Company are the following accounts:

Cost of goods sold	\$101,000	Selling expenses	\$28,000
Sales	200,000	Sales returns and allowances	5,000
General and administrative expenses	20,000	Interest revenue	4,000
Loss from strike (pretax)	9,000	Extraordinary loss (pretax)	17,000

*Additional data:*

- Seven thousand shares of common stock have been outstanding the entire year.
- The income tax rate is 30% on all items of income.

**Required**

- Prepare a 2007 multiple-step income statement.
- Prepare a 2007 single-step income statement.

**E5-6 Multiple-Step and Single-Step Income Statements, and Statement of Comprehensive Income** On December 31, 2007 the Adandt Company listed the following items in its adjusted trial balance:

Extraordinary loss (pretax)	\$ 8,000	Loss on sale of equipment (pretax)	\$ 2,000
Interest revenue	2,500	General and administrative expenses	17,000
Sales returns and allowances	3,000	Sales	163,000
Selling expenses	14,000	Unrealized decrease in value of available-for-sale securities	1,800
Cost of goods sold	95,000		

*Additional data:*

- Seven thousand shares of common stock have been outstanding the entire year.
- The income tax rate is 30% on all items of income.

**Required**

- Prepare a 2007 multiple-step income statement.
- Prepare a 2007 single-step income statement.
- Prepare a 2007 statement of comprehensive income.

**E5-7 Cost of Goods Sold and Income Statement** The Fanta Company presents you with the following account balances taken from its December 31, 2007 adjusted trial balance:

Inventory, January 1, 2007	\$ 43,000	Purchases returns	\$3,500
Selling expenses	35,000	Interest expense	4,000
Extraordinary gain (pretax)	23,000	Sales discounts taken	2,000
Purchases	100,000	Gain on sale of property (pretax)	7,000
Sales	250,000	Freight-in	5,000
General and administrative expenses	22,000		

*Additional data:*

- A physical count reveals an ending inventory of \$22,500 on December 31, 2007.
- Twenty-five thousand shares of common stock have been outstanding the entire year.
- The income tax rate is 30% on all items of income.

**Required**

1. As a supporting document for Requirements 2 and 3, prepare a separate schedule for Fanta Company's cost of goods sold.
2. Prepare a 2007 multiple-step income statement.
3. Prepare a 2007 single-step income statement.

**E5-8 Cost of Goods Sold, Income Statement, and Statement of Comprehensive Income** The Engle Company lists the following accounts on its adjusted trial balance as of December 31, 2007.

Sales	\$147,100	Interest revenue	\$ 3,300
Purchases returns	5,200	Purchases discounts taken	2,700
Gain on sale of equipment (pretax)	3,800	Inventory, January 1, 2007	12,100
Freight-in	3,400	Sales returns	8,100
Selling expenses	15,600	Purchases	89,700
Unrealized increase in value of available-for-sale securities	2,400	Administrative expenses	24,200
		Extraordinary loss (pretax)	6,500

The following additional information is also available. The December 31, 2007, ending inventory is \$14,700. During 2007, 4,200 shares of common stock were outstanding the entire year. The income tax rate is 30% on all items of income.

**Required** 

1. As a supporting document for Requirements 2 and 3, prepare a separate schedule for Engle Company's cost of goods sold.
2. Prepare a 2007 single-step income statement.
3. Prepare a 2007 multiple-step income statement.
4. Prepare a 2007 statement of comprehensive income.

**E5-9 Income Statement and Retained Earnings** The Senger Company presents the following partial list of account balances taken from its December 31, 2007 adjusted trial balance:

Sales (net)	\$124,000	Operating expenses	\$30,400
Interest expense	3,700	Common stock, \$5 par	22,000
Cost of goods sold	66,200	Retained earnings, 1/1/2007	45,800

The following information is also available for 2007 and is not reflected in the preceding accounts:

1. The common stock has been outstanding all year. A cash dividend of \$1.28 per share was declared and paid.
2. Land was sold at a pretax gain of \$6,300.
3. Division X (a component of the company) was sold at a pretax gain of \$4,700. It had incurred a \$9,500 pretax operating loss during 2007.
4. A tornado, which is an unusual and infrequent event in the area, caused a \$5,400 pretax loss.
5. The income tax rate on all items of income is 30%.
6. The average stockholders' equity is \$90,000.

**Required**

1. Prepare a 2007 multiple-step income statement for Senger Company.
2. Prepare a 2007 retained earnings statement.
3. Compute the 2007 return on stockholders' equity (net income ÷ average stockholders' equity).

**E5-10 Income Statement and Retained Earnings** The Cobler Company uses a periodic inventory system and presents the following partial list of account balances taken from its December 31, 2007 adjusted trial balance:

Operating expenses	\$ 35,800	Common stock, \$15 par	\$45,000
Dividend revenue	1,000	Merchandise inventory, January 1, 2007	24,000
Retained earnings, January 1, 2007	68,700	Purchases (net)	79,200
Sales (net)	139,600		

The following information is also available for 2007 and is not reflected in the preceding accounts:

1. The common stock has been outstanding for the entire year. A cash dividend of \$0.84 per share was declared and paid.
2. The income tax rate on all items of income is 30%.
3. The ending merchandise inventory is \$27,300.
4. A pretax \$4,000 loss was recognized on the sale of Division X (a component of the company). This division had earned a pretax operating income of \$1,900 during 2007.
5. Damaged inventory was written off at a pretax loss of \$6,600.
6. An earthquake, which is an unusual and infrequent event in the area, caused a \$3,700 pretax loss.

**Required**

1. Prepare a cost of goods sold schedule for Cobler Company.
2. Prepare a 2007 single-step income statement.
3. Prepare a 2007 retained earnings statement.
4. Compute the 2007 profit margin (net income ÷ net sales).

**E5-11 Income Statement Calculations** The income statement information for 2007 and 2008 of the Caleb Company (a sole proprietorship) is as follows:

	2007	2008
Cost of goods sold	\$ (a)	\$59,300
Interest expense	600	0
Selling expenses	(b)	10,800
Operating income	21,800	(d)
Sales (net)	96,000	(e)
General expenses	7,900	(f)
Net income	(c)	21,600
Interest revenue	0	600
Gross profit	39,000	40,200

**Required**

Fill in the blanks labeled (a) through (f). All the necessary information is listed. (*Hint:* It is not necessary to calculate your answers in alphabetical order.)

**E5-12 Income Statement Calculations** The income statement information for 2007 and 2008 of the Connor Company (a sole proprietorship) is as follows:

	2007	2008
Beginning inventory	\$ (a)	\$ (d)
Sales	210,000	(e)
Purchases	130,000	140,000
Purchases returns and allowances	7,000	6,000
Ending inventory	62,000	(f)
Sales returns and allowances	4,000	9,000
Gross profit	(b)	100,000
Cost of goods sold	114,000	120,000
Selling expenses	35,000	36,000
Transportation-in	2,000	5,000
General and administrative expenses	20,000	(g)
Net income	(c)	43,000

**Required**

Fill in the blanks labeled (a) through (g). All the necessary information is listed. (*Hint:* It is not necessary to calculate your answers in alphabetical order.)

**E5-13 Results of Discontinued Operations** During December 2007, Smythe Company decides to sell Division F (a component of the company). On December 31, 2007, the company classifies Division F as held for sale. On that date, the book values of Division F's assets and liabilities are \$950,000 and \$600,000, respectively. Smythe expects to sell Division F in 2008 and estimates that the fair value of Division F is \$250,000. During 2007, Division F earned revenues of \$1,000,000 and incurred expenses of \$1,300,000. Smythe Company is subject to a 30% income tax rate.

**Required**

Prepare the results from discontinued operations section of Smythe Company's income statement for 2007. Show supporting calculations.

**E5-14 Results of Discontinued Operations** On November 30, 2007, Feiner Company announced its plans to discontinue the operations of Division P (a component of the company) by selling the division. On December 31, 2007, Division P had not yet been sold and was classified as held for sale. On this date, Division P had assets with a book value of \$920,000 and liabilities with a book value of \$610,000. Feiner Company estimates that the fair value of Division P on this date is \$190,000. During 2007, Division P earned revenues of \$920,000 and incurred expenses of \$980,000. Feiner Company is subject to a 30% income tax rate.

**Required**

Prepare the results from discontinued operations section of Feiner Company's income statement for 2007. Show supporting calculations.

**E5-15 AICPA Adapted** *Income Statement Deficiencies* David Company's Statements of Income for the year ended December 31, 2008, and December 31, 2007, are presented here:

	Year Ended December 31,	
	2008	2007
Net sales	\$900,000	\$750,000
Costs and expenses:		
Cost of goods sold	\$720,000	\$600,000
Selling, general and administrative expenses	112,000	90,000
Other, net	<u>11,000</u>	<u>9,000</u>
Total costs and expenses	<u>\$843,000</u>	<u>\$699,000</u>
Income from continuing operations before income taxes	\$ 57,000	\$ 51,000
Income taxes	<u>23,000</u>	<u>24,000</u>
Income from continuing operations	\$ 34,000	\$ 27,000
Loss on sale of Dex Division, less applicable income taxes of \$8,000	8,000	—
Cumulative effect on prior years of change in depreciation method, less applicable income taxes of \$1,500	—	<u>3,000</u>
Net income	<u>\$ 26,000</u>	<u>\$ 30,000</u>
Earnings per share of common stock:		
Income before cumulative effect of change in inventory method	\$ 2.60	\$2.70
Cumulative effect on prior years of change in inventory method, less applicable income taxes	—	<u>.30</u>
Net income	<u>\$ 2.60</u>	<u>\$ 3.00</u>

Additional facts are as follows:

- On January 1, 2007, David Company changed its inventory method from the average cost method to the first-in, first-out method, and justified the change.
- The loss from operations of the discontinued Dex Division (a component of the company) from January 1, 2008 to September 30, 2008 (the portion of the year prior to the date of sale) and from January 1, 2007 to December 31, 2007 is included in David Company's Statements of Income for the year ended December 31, 2008 and December 31, 2007 respectively, in "other, net."
- David Company has a simple capital structure with only common stock outstanding, and the net income per share of common stock was based on the weighted average number of common shares outstanding during each year.
- David Company common stock is listed on the New York Stock Exchange and closed at \$13 per share on December 31, 2008 and \$15 per share on December 31, 2007.

#### Required

Determine from the additional facts listed whether the presentation of those facts in David Company's Statements of Income is appropriate. If the presentation is appropriate, discuss the rationale for the presentation. If the presentation is not appropriate, specify the appropriate presentation and discuss its rationale. Do *not* discuss disclosure requirements for the Notes to the Financial Statements.

**E5-16 Net Income and Comprehensive Income** On December 31, 2007 TNT Company lists the following accounts in its adjusted trial balance:

Sales (net)	\$85,000
Unrealized increase in value of available-for-sale securities	4,000
Operating expenses	18,000
Cost of goods sold	47,000

The income tax rate is 30% on all items of income.

#### Required

- Prepare a 2007 multiple-step income statement, which includes comprehensive income (disregard earnings per share).
- Prepare (a) a 2007 multiple-step income statement (disregard earnings per share) and (b) a 2007 statement of comprehensive income.

**E5-17 Net Cash Flow From Operating Activities** The following are accounting items taken from the records of the Tyrone Company for 2007:

- |   |   |
|---|---|
| a. Net income, \$22,900                           | f. Patent amortization expense, \$2,700     |
| b. Payment for purchase of land, \$4,000          | g. Bond discount amortization, \$1,000      |
| c. Payment for retirement of bonds, \$6,000       | h. Increase in accounts receivable, \$3,400 |
| d. Depreciation expense, \$7,800                  | i. Payment of dividends, \$5,000            |
| e. Receipt from issuance of common stock, \$7,000 | j. Decrease in accounts payable, \$2,600    |

**Required**

Prepare the net cash flow from operating activities section of the Tyrone Company's 2007 statement of cash flows.

**E5-18 Operating Cash Flows: Direct Method** The following are various cash flows and other information of the Lexie Company for 2007:

- |                                       |  |
|---------------------------------------|--|
| a. Payments of interest, \$8,200      | f. Collections from customers, \$101,600         |
| b. Receipt from sale of land, \$7,900 | g. Payments of income taxes, \$15,400            |
| c. Interest collected, \$10,000       | h. Receipt from issuance of stock, \$18,900      |
| d. Payment of dividends, \$12,100     | i. Payments to suppliers and employees, \$67,500 |
| e. Depreciation expense, \$24,700     | j. Increase in inventories, \$4,600              |

**Required**

Using the direct method, prepare the cash flows from operating activities section of the Lexie Company's 2007 statement of cash flows.

**E5-19 Statement of Cash Flows** The following are several items involving the cash flow activities of the Rocky Company for 2007:

- |   |  |
|---|--|
| a. Net income, \$41,000                                       | f. Accounts receivable decreased by \$2,000    |
| b. Payment of dividends, \$16,000                             | g. Accounts payable decreased by \$4,000       |
| c. Ten-year, \$28,000 bonds payable were issued at face value | h. Equipment was acquired at a cost of \$8,000 |
| d. Depreciation expense, \$11,000                             | i. Inventories increased by \$7,000            |
| e. Building was acquired at a cost of \$40,000                | j. Beginning cash balance, \$13,000            |

**Required**

Prepare the statement of cash flows of the Rocky Company for 2007.

**E5-20 Statement of Cash Flows** The following are several items involving the cash flow activities of the Jones Company for 2007:

- |  |  |
|--|--|
| a. Net income, \$60,400                            | f. Patent amortization expense, \$1,200      |
| b. Receipt from issuance of common stock, \$32,000 | g. Payment of dividends, \$21,000            |
| c. Payment for purchase of equipment, \$41,500     | h. Decrease in salaries payable, \$2,600     |
| d. Payment for purchase of land, \$19,600          | i. Increase in accounts receivable, \$10,300 |
| e. Depreciation expense, \$20,500                  | j. Beginning cash balance, \$30,700          |

**Required**

Prepare the statement of cash flows of the Jones Company for 2007.

## PROBLEMS

**P5-1 Comprehensive Income Framework** The following is an alphabetical list of accounts for the Mack Company:

- |  |                                     |
|--|-------------------------------------|
| Accounts payable   | Allowance for doubtful accounts     |
| Accounts receivable                                      | Bad debts expense                   |
| Accumulated depreciation, buildings and office equipment | Bonds payable                       |
| Accumulated depreciation, store and delivery equipment   | Buildings                           |
| Administrative salaries                                  | Cash                                |
| Advertising expense                                      | Cash dividends declared             |
|  | Common stock, \$10 par              |
|  | Correction of previous years' error |

Delivery expense	Miscellaneous service revenues
Depreciation expense, buildings and office equipment	Mortgage payable
Depreciation expense, store and delivery equipment	Office salaries
Dividend revenue	Office supplies used
Dividends payable	Paid-in capital on common stock
Freight on purchases	Prepaid office supplies
Fund to retire long-term bonds	Property tax expense
Gain on sale of equipment	Purchases
Gain on sale of Division T	Purchases discounts taken
Income tax expense	Purchases returns and allowances
Insurance expense	Rent revenue
Interest expense	Retained earnings, January 1, 2007
Interest payable	Salaries payable
Interest revenue	Sales
Investment in securities (long-term)	Sales commissions
Loss from expropriation	Sales discounts taken
Loss from operations of discontinued Division T	Sales returns and allowances
Loss on sale of office equipment	Sales salaries
Merchandise inventory, January 1, 2007	Stock dividends declared
Merchandise inventory, December 31, 2007	Unearned rent
Miscellaneous office expenses	Unexpired insurance
Miscellaneous sales expenses	Unrealized increase in value of available-for-sale securities
	Utilities expense

**Required**

Ignoring amounts, select the appropriate accounts of Mack Company and prepare for 2007:

1. A multiple-step income statement with proper subheadings
2. A statement of comprehensive income
3. A retained earnings statement

**P5-2 Account Classifications** Given the following code letters and components of financial statements, indicate where each item would most likely be reported in the financial statements by inserting the corresponding code letters. Assume the monetary amount of each item is material.

Code Letter	Component
A	Sales revenues (net)
B	Cost of goods sold
C	Selling expenses
D	General and administrative expenses
E	Other items
F	Results from discontinued operations
G	Extraordinary items
H	Prior period adjustments
I	Additions to retained earnings (other than H)
J	Deductions from retained earnings (other than H)
K	Notes to financial statements
L	Ending balance sheet

_____	1. Purchases	_____	11. Purchases returns and allowances
_____	2. Loss on sale of equipment	_____	12. Premium on bonds payable
_____	3. Utilities expense	_____	13. Gain on sale of land
_____	4. Cash dividends declared on common stock	_____	14. Interest expense
_____	5. Bad debts expense	_____	15. Delivery expense
_____	6. Sales salaries	_____	16. Expenses incurred as a result of a strike
_____	7. Sales discounts taken	_____	17. Summary of accounting policies
_____	8. Transportation-in	_____	18. Gain on disposal of Division J
_____	9. Net income	_____	19. Interest revenue
_____	10. Gain on retirement of long-term debt	_____	20. Additional paid-in capital on common stock

- |  |  |
|--|--|
| _____ 21. Loss from write-down of obsolete inventory   | _____ 27. Gain on sale of factory                    |
| _____ 22. Administrative salaries  | _____ 28. Loss from frost damage in southern Arizona |
| _____ 23. Stock dividends declared on common stock   | _____ 29. Sales returns                              |
| _____ 24. Correction of erroneous understatement of last year's ending inventory                       | _____ 30. Depreciation expense for office equipment  |
| _____ 25. Operating loss related to discontinued Division J  | _____ 31. Sales commissions                          |
| _____ 26. Additional depreciation on office equipment resulting from decrease in estimated useful life | _____ 32. Promotion expense                          |
|  | _____ 33. Merchandise inventory (beginning)          |

**P5-3** *Income Statement, Lower Portion* At the beginning of 2007, the retained earnings of the Cameron Company was \$212,000. For 2007, the company has calculated its pretax income from continuing operations to be \$120,000. During 2007, the following events also occurred:

1. During July the company sold Division M (a component of the company). It has determined that the pretax income from the operations of Division M during 2007 totals \$39,000 and that a pretax loss of \$40,500 was incurred on the sale of Division M.
2. The company had 21,000 shares of common stock outstanding during all of 2007. It declared and paid a \$1 per share cash dividend on this stock.
3. The company experienced an extraordinary event. It recognized a material pretax gain of \$26,000 on the event.
4. The company found and corrected a pretax \$18,000 understatement of the 2006 ending inventory because of a mathematical error.

**Required**

Assuming that all the "pretax" items are subject to a 30% income tax rate:

1. Complete the lower portion of Cameron Company's 2007 income statement, beginning with "Pretax Income from Continuing Operations."
2. Prepare an accompanying retained earnings statement.

**P5-4** *Income Statement, Lower Portion* Cunningham Company reports a retained earnings balance of \$365,200 at the beginning of 2007. For the year ended December 31, 2007, the company reports pretax income from continuing operations of \$150,500. The following information is also available pertaining to 2007:

1. The company declared and paid a \$0.72 cash dividend per share on the 30,000 shares of common stock that were outstanding the entire year.
2. The company found and corrected a pretax \$48,000 understatement of 2006 depreciation expense because of a mathematical error.
3. The company incurred a pretax \$21,000 loss as a result of an earthquake, which is unusual and infrequent for the area.
4. The company sold Division P (a component of the company) in May. From January through May, Division P had incurred a pretax loss from operations of \$33,000. A pretax gain of \$15,000 was recognized on the sale of Division P.
5. Because of additional information, the company determined that the estimated useful life of certain depreciable assets had decreased. As a result, the current depreciation expense included in the 2007 pretax income from continuing operations is \$7,000 higher than it would have been had the original estimated useful life been used in the calculations.

**Required**

Assuming that all the "pretax" items are subject to a 30% income tax rate:

1. Complete the lower portion of Cunningham Company's 2007 income statement beginning with "Pretax Income from Continuing Operations." Include any related note to the financial statements.
2. Prepare an accompanying retained earnings statement.

**P5-5** *Comprehensive: Income Statement and Retained Earnings* The Houston Manufacturing Company presents the following partial list of account balances, after adjustments, as of December 31, 2007:

Sales salaries expense	\$ 27,400	Sales personnel travel expenses	\$ 8,300
Miscellaneous administrative expenses	3,000	Property taxes and insurance expense	9,000
Sales returns	5,000	Retained earnings, January 1, 2007	200,800
Sales	468,200	Depreciation expense: sales equipment	9,000
Interest revenue	3,200	Advertising expense	15,700
Office and administrative salaries	30,000	Miscellaneous rent revenue	5,900
Delivery expenses	11,700	Common stock, \$10 par	200,000
Loss on sale of factory equipment (pretax)	4,100	Depreciation expense: buildings and office equipment	14,400
Cost of goods sold	232,200		

The following information is also available but is not reflected in the preceding accounts:

- The company sold Division E (a component of the company) on August 1, 2007. During 2007, Division E had incurred a pretax loss from operations of \$16,000. However, because the acquiring company could vertically integrate Division E into its facilities, the Houston Manufacturing Company was able to recognize a \$42,000 pretax gain on the sale.
- On January 2, 2007, without warning, a foreign country expropriated a factory of Houston Manufacturing Company, which had been operating in that country. As a result of that expropriation, the company has incurred a pretax loss of \$30,000.
- In preparing its 2007 adjusting entries at year-end, the company discovered that it had not recorded \$10,100 of depreciation on its office building during 2006. This error did not affect the 2007 depreciation expense.
- The common stock was outstanding for the entire year. A cash dividend of \$1.20 per share was declared and paid in 2007.
- The 2007 income tax expense totals \$28,020 and consists of the following:
 

Tax expense on income from continuing operations	\$32,250
Tax credit on Division E operating loss	(4,800)
Tax expense on gain from sale of Division E	12,600
Tax credit on loss from expropriation	(9,000)
Tax credit on 2006 depreciation error	(3,030)
	\$28,020

### Required

- As supporting documents for Requirement 2, prepare separate supporting schedules for selling expenses and for general and administrative expenses (include depreciation expense where applicable in these schedules).
- Prepare a 2007 multiple-step income statement for the Houston Manufacturing Company.
- Prepare a 2007 retained earnings statement.
- What was Houston Manufacturing Company's return on stockholders' equity for 2007 if its average stockholders' equity during 2007 was \$500,000? What is your evaluation of this return on stockholders' equity if its "target" for 2007 was 15%?

**P5-6 Comprehensive: Income Statement and Retained Earnings** The following selected accounts are taken from the Crandle Corporation's December 31, 2007 adjusted trial balance:

Retained earnings, January 1, 2007	\$428,900	Office supplies expense	\$ 1,800
Interest expense	4,900	Transportation-out (deliveries)	6,000
Depreciation expense: sales fixtures	8,500	Cost of goods sold	191,200
Sales returns and allowances	11,300	Sales discounts taken	5,200
Advertising expense	14,100	Bad debt expense	1,900
Common stock, \$10 par	110,000	Sales supplies expense	4,600
Administrative and office salaries expense	29,500	Sales salaries expense	16,500
Dividend revenue	900	Depreciation expense: buildings and office equipment	10,000
Sales	378,000	Income tax expense	15,870
Property tax expense	7,700		
Gain on sale of sales fixtures (pretax)	5,000		

In addition to the preceding account balances, you have available the following information:

- In the middle of December 2007 the company incurred a material \$5,500 pretax loss as a result of a freak flood of a river that had never flooded before.
- While making its December 31, 2007 adjusting entries, the company discovered the following:
  - In recording its December 31, 2006 adjusting entries, it had inadvertently recorded depreciation expense twice for the same asset. The amount of the error was \$4,000 pretax and is considered material. The error did not have any effect upon the depreciation recorded for 2007.
  - Based on an analysis of the company's recent favorable experience with uncollectible accounts receivable, the company decided to reduce the percentage used in computing bad debt expense. The use of the new percentage resulted in the \$1,900 bad debt expense being \$500 less than the amount that would have been calculated using the old percentage.
- On April 1, 2007 the company sold Division M (a component of the company), which had been unprofitable for several years. For the first 3 months of 2007, Division M had incurred a pretax operating loss of \$8,800. Division M was sold at a pretax loss of \$7,500.
- The company paid cash dividends of \$0.90 per share on its common stock. All the stock was outstanding for the entire year.
- The company is subject to a 30% income tax rate. The \$15,870 Income Tax Expense account balance consists of \$21,210 tax on income from continuing operations and \$1,200 tax on the depreciation correction, and tax credits of \$2,640 on the operating loss of Division M, \$2,250 on the loss from sale of Division M, and \$1,650 on the loss because of the flood.

**Required**

1. As supporting documents for Requirement 2, prepare separate schedules for selling expenses and for general and administrative expenses (include each depreciation expense where applicable in these schedules).
2. Prepare a 2007 single-step income statement for the Cradle Corporation. Include any related note to the financial statements.
3. Prepare a 2007 retained earnings statement.
4. What was Cradle Corporation's profit margin for 2007? What is your evaluation of Cradle's 2007 profit margin if last year it was 8%?

**P5-7 Comprehensive: Income Statement and Supporting Schedules** The following is a partial list of the account balances, after adjustments, of the Silvos Company on December 31, 2007:

Depreciation expense: buildings and office equipment	\$ 14,500	Office supplies expense	\$ 1,400
Sales commissions and salaries	18,200	Common stock, \$10 par	80,000
Inventory, January 1, 2007	37,800	Loss on sale of office equipment (pretax)	5,000
Sales supplies used	5,600	Insurance and property tax expense	8,500
Retained earnings, January 1, 2007	83,700	Sales	340,700
Purchases returns and allowances	6,200	Rent revenue	6,900
Bad debts expense	2,700	Office and administrative salaries expense	32,000
Transportation-in	13,500	Promotion and advertising expense	17,000
Sales discounts taken	4,900	Sales returns and allowances	12,100
Purchases	173,000	Purchases discounts taken	4,100
Delivery expense	7,700	Depreciation expense: sales equipment	9,600
		Interest expense	3,700

The following information is also available:

1. The company declared and paid a \$0.60 per share cash dividend on its common stock. The stock was outstanding the entire year.
2. A physical count determined that the December 31, 2007 ending inventory is \$34,100.
3. A tornado destroyed a warehouse, resulting in a pretax loss of \$12,000. The last tornado in this area had occurred 20 years earlier.
4. While making its December 31, 2007 adjusting entries, the company determined that:
  - a. In 2006, it had inadvertently omitted \$11,000 depreciation expense on its buildings and office equipment. The error did not have any effect upon the depreciation recorded in 2007.
  - b. Because of recently increased obsolescence, its sales equipment should be depreciated over a shorter useful life. The resulting \$2,500 of additional depreciation has been included in the 2007 depreciation expense.
5. On May 1, 2007, the company sold an unprofitable division (R). From January through April, Division R (a component of the company) had incurred a pretax operating loss of \$8,700. Division R was sold at a pretax gain of \$10,000.
6. The company is subject to a 30% income tax rate. Its income tax expense for 2007 totals \$930. The breakdown is as follows:

Income Tax Expense (Credit) Related to	Amount
Continuing income	\$ 7,440
Operating loss of Division R	(2,610)
Gain on sale of Division R	3,000
Loss from tornado	(3,600)
Error in recording 2006 depreciation expense	(3,300)
	<u>\$ 930</u>

7. The company had average stockholders' equity of \$150,000 during 2007.

**Required**

1. As supporting documents for Requirement 2, prepare separate supporting schedules for cost of goods sold, selling expenses, general and administrative expenses, and depreciation expense.
2. Prepare a 2007 multiple-step income statement for the Silvos Company. Include any related note to the financial statements.
3. Prepare a 2007 retained earnings statement.
4. What was Silvos Company's return on stockholders' equity for 2007? What is your evaluation of Silvos Company's return on stockholders' equity if last year it was 10%?

**P5-8 Misclassifications** The Rox Corporation's multiple-step income statement and retained earnings statement for the year ended December 31, 2007, as developed by its bookkeeper, are shown here:

ROX CORPORATION		
Revenue Statement		
December 31, 2007		
Sales (net)		\$ 179,000
Plus: Income from operations of discontinued Division P (net of \$960 income taxes)		2,240
Less: Dividends declared (\$1.50 per common share)		<u>(7,500)</u>
Net revenues		\$ 173,740
Less: Selling expenses		<u>(19,000)</u>
Gross profit		\$ 154,740
Less: Operating expenses		
Interest expense	\$ 4,100	
Loss on sale of Division P (net of \$1,200 income tax credit)	2,800	
Cost of goods sold	110,700	
Income tax expense on income from continuing operations	<u>5,370</u>	
Total operating expenses		<u>(122,970)</u>
Operating income		\$ 31,770
Miscellaneous items		
Dividend revenue	\$ 1,800	
General and administrative expenses	<u>(24,300)</u>	<u>(22,500)</u>
Income before extraordinary items		\$ 9,270
Extraordinary items		
Loss on sale of land	\$ (4,800)	
Correction of error in last year's income (net of \$1,500 income taxes)	<u>3,500</u>	<u>(1,300)</u>
Net income		<u><u>\$ 7,970</u></u>

ROX CORPORATION  
Retained Earnings Statement  
December 31, 2007

Beginning retained earnings	\$ 62,850
Add: Net income	<u>7,970</u>
Adjusted retained earnings	\$ 70,820
Less: Loss from expropriation (net of \$2,760 income tax credit)	<u>(6,440)</u>
Ending retained earnings	<u><u>\$ 64,380</u></u>

You determine that the account *balances* listed in the statements are correct but are incorrectly classified in certain cases. No shares of common stock were issued or retired during 2007.

**Required**

1. Review both statements and indicate where each incorrectly classified item should be classified.
2. Prepare a correct multiple-step 2007 income statement.
3. Prepare a correct 2007 retained earnings statement.

**P5-9 Misclassifications** The bookkeeper for the Olson Company prepared the following income statement and retained earnings statement for the year ended December 31, 2007:

OLSON COMPANY  
December 31, 2007  
Expense and Profits Statement

Sales (net)	\$ 196,000
Less: Selling expenses	<u>(19,600)</u>
Net sales	\$ 176,400
Add: Interest revenue	2,300
Add: Gain on sale of equipment	<u>3,200</u>
Gross sales revenues	\$ 181,900

Less: Costs of operations		
Cost of goods sold	\$120,100	
Correction of overstatement in last year's income because of error (net of \$1,650 income tax credit)	3,850	
Dividend costs (\$0.50 per share for 8,000 common shares)	4,000	
Extraordinary loss because of earthquake (net of \$1,800 income tax credit)	4,200	(132,150)
Taxable revenues		\$ 49,750
Less: Income tax on income from continuing operations		(12,480)
Net income		\$ 37,270
Miscellaneous deductions		
Loss from operations of discontinued Division L (net of \$900 income tax credit)	\$ 2,100	
Administrative expenses	16,800	(18,900)
Net revenues		<u>\$ 18,370</u>

**OLSON COMPANY**  
**Retained Revenues Statement**  
**For Year Ended December 31, 2007**

Beginning retained earnings	\$59,300
Add: Gain on sale of Division L (net of \$1,350 income taxes)	<u>3,150</u>
Recalculated retained earnings	\$62,450
Add: Net revenues	<u>18,370</u>
	\$80,820
Less: Interest expense	<u>(3,400)</u>
Ending retained earnings	<u>\$77,420</u>

The preceding account *balances* are correct but have been incorrectly classified in certain instances.

**Required** 

Prepare a corrected 2007 multiple-step income statement and a 2007 retained earnings statement.

**P5-10 Classification of Unusual and/or Infrequent Items** The following are a number of unusual and/or infrequent gains or losses that might be disclosed on the income statement or retained earnings statement. All items are considered to be material in amount.

1. A loss from an earthquake that destroyed a chemical plant of a major chemical company. The region where the plant was destroyed had not had an earthquake in 15 years.
2. A gain resulting from the retirement of bonds payable. The bonds payable had been classified as current liabilities on last year's ending balance sheet because of their expected retirement during the current year.
3. A reduction in the current depletion expense as a result of the discovery of additional mineral deposits.
4. A gain from the sale of land. The land had been purchased for the construction of a new factory. The company has built several new factories over the past several years, and in each instance has acquired more land than necessary for the factory site. After completion of the factory, the excess land is sold at its appreciated value.
5. A loss incurred by a corporation on the sale of an investment in bonds of a publicly held company. The bonds constitute 5% of the net assets of the publicly held company. The corporation has been holding these bonds as an investment for several years. This is the only investment in securities the corporation has ever made.
6. A loss incurred as a result of an earthquake that destroyed a 2-year-old storage facility of a large retail chain. The storage facility is located in California. A major earthquake occurred in the same region 2 years ago, just prior to the construction of the facility.
7. A decrease in previous years' earnings as a result of a change from the first-in, first-out inventory method to the average cost inventory method at the beginning of the current year.
8. A loss incurred in the spring by a retail store in a shopping center as a result of a flood of a nearby stream. Although the stream has overflowed several times in the past six years, only 3 stores (out of 38) in the shopping center had previously incurred a significant flood loss.
9. A gain recognized as the result of the sale by a food processing company of a 15% interest in a professional baseball team.
10. A reduction in last year's income as a result of the discovery in the current year of a miscount (overstatement) of last year's ending inventory.
11. A loss incurred by a diversified citrus grower because of frost damage in southern California. No frost damage has occurred in the region for seven years, although last year the citrus grower had incurred a loss because of frost damage to its Florida operations.

**Required**

For each item, indicate in which section of the income statement or retained earnings statement it should be disclosed. Justify your disclosure.

**P5-11 Results of Discontinued Operations** On November 1, 2007, Woods Company announced its plans to sell Division J (a component of the company). By December 31, 2007, Woods Company had not sold Division J and so it classifies the division as held for sale.

During 2007, Woods Company recorded the following revenues and expenses for Division J and the remainder of the company.

	<i>Division J</i>	<i>Remainder of Company</i>
Sales revenues	\$170,000	\$950,000
Cost of goods sold	119,000	560,000
Operating expenses	42,000	190,000

The company is subject to a 30% income tax rate.

On December 31, 2007, the net book value of Division J is \$500,000, consisting of assets of \$910,000 and liabilities of \$410,000. On this date, Woods Company estimates that the fair value of Division J is \$420,000. The company had 50,000 shares of common stock outstanding during all of 2007.

**Required**

1. Prepare the journal entry on December 31, 2007 to record the pretax loss on held-for-sale Division J. Show supporting calculations.
2. Prepare a 2007 multiple-step income statement for Woods Company.
3. Show how Division J would be reported on Woods Company's December 31, 2007 balance sheet.

**P5-12 Analyzing Coca-Cola's Income Statement and Cash Flow Statement Disclosures** Review the financial statements and notes of the Coca-Cola Company in Appendix A.

**Required** (Note: You do not need to make any calculations).

1. Does the company use a multiple-step or a single-step format on its income statement? Explain.
2. What was the net income for 2004? What was the basic net income (earnings) per common share for 2004?
3. What was the gross profit for 2004? For 2003?
4. How much interest expense was incurred in 2004? In 2003?
5. What was the amount of the income taxes related to income before income taxes for 2004?
6. What was the amount of selling, general, and administrative expenses in 2004? Of this amount, what was the amount for stock-based compensation expense?
7. What amount of dividends on common stock were paid per share and in total in 2004?
8. What were the net operating revenues and gross profit, respectively, for the fourth quarter of 2004?
9. What method was used to determine the net cash provided by operating activities in 2004? What was the amount?
10. What was the net cash used in investing activities in 2004?
11. What was the cash provided by the issuances of debt in 2004?

**P5-13 AICPA Adapted Complex Income Statement** The following is the adjusted trial balance for the Woodbine Circle Corporation on December 31, 2007:

	Debit	Credit
Cash	\$ 500,000	
Accounts receivable, net	1,500,000	
Inventory	2,500,000	
Property, plant, and equipment	15,100,000	
Accumulated depreciation		\$ 4,900,000
Accounts payable		2,200,000
Income taxes payable		200,000
Notes payable		1,000,000
Common stock (\$1 par value)		1,000,000
Additional paid-in capital		6,200,000
Retained earnings, Jan. 1, 2007		3,000,000
Sales—regular		10,100,000
Sales—AL Division		2,000,000
Cost of sales—regular	6,200,000	
Cost of sales—AL Division	900,000	

	Debit	Credit
Administrative expenses—regular	2,000,000	
Administrative expenses—AL Division	300,000	
Interest expense—regular	210,000	
Interest expense—AL Division	140,000	
Loss on sale of AL Division	250,000	
Gain from extraordinary event		300,000
Income tax expense	900,000	
	<u>\$30,500,000</u>	<u>\$30,500,000</u>

Other financial data for the year ended December 31, 2007:

Federal Income Taxes	
Paid on Federal Tax Deposit Form	\$700,000
Accrued	200,000
Total charged to income tax expense (estimated)	<u>\$900,000</u>
Tax rate on all types of taxable income	<u>40%</u>

#### Discontinued Operations

On September 30, 2007 Woodbine sold its Auto Leasing (AL) Division for \$4,000,000. The book value of this division was \$4,250,000 at that date. For financial statement purposes, this sale was considered as discontinued operation of a component of the company.

#### Capital Structure

Common stock, par value \$1 per share, traded on the New York Stock Exchange:

Number of shares outstanding during all of 2007	<u>1,000,000</u>
---	------------------

#### Required

Using the multiple-step format, prepare a formal income statement for Woodbine for the year ended December 31, 2007, together with the appropriate supporting schedules. All income taxes should be appropriately shown.

**P5-14 AICPA Adapted Comparative Income Statements** The Century Company, a diversified manufacturing company, had four separate operating divisions engaged in the manufacture of products in each of the following areas: food products, health aids, textiles, and office equipment. Financial data for the 2 years ended December 31, 2008 and 2007 are presented here:

	Net Sales	
	2008	2007
Food products	\$3,500,000	\$3,000,000
Health aids	2,000,000	1,270,000
Textiles	1,580,000	1,400,000
Office equipment	920,000	1,330,000
	<u>\$8,000,000</u>	<u>\$7,000,000</u>

	Cost of Sales	
	2008	2007
Food products	\$2,400,000	\$1,800,000
Health aids	1,100,000	700,000
Textiles	500,000	900,000
Office equipment	800,000	1,000,000
	<u>\$4,800,000</u>	<u>\$4,400,000</u>

	Operating Expenses	
	2008	2007
Food products	\$ 550,000	\$ 275,000
Health aids	300,000	125,000
Textiles	200,000	150,000
Office equipment	650,000	750,000
	<u>\$1,700,000</u>	<u>\$1,300,000</u>

On January 1, 2008, Century adopted a plan to sell the assets and product line of the office equipment division and considered it a component of the company. On September 1, 2008, the division's assets and product line were sold for \$2,100,000 cash, resulting in a gain of \$640,000.

The company's textiles division had six manufacturing plants that produced a variety of textile products. In April 2008, the company sold one of these plants and realized a gain of \$130,000. After the sale the operations at the plant that was sold were transferred to the remaining five textile plants, which the company continued to operate.

In August 2008, the main warehouse of the food products division, located on the banks of the Bayer River, was flooded when the river overflowed. The resulting damage of \$420,000 is not included in the financial data given previously. Historical records indicate that the Bayer River normally overflows every 4 to 5 years, causing flood damage to adjacent property.

For the 2 years ended December 31, 2008 and 2007 the company had interest revenue earned on investments of \$70,000 and \$40,000, respectively.

The provision for income tax expense for each of the 2 years should be computed at a rate of 40%.

### Required

Prepare in proper form a multiple-step comparative statement of income of the Century Company for the 2 years ended December 31, 2008 and December 31, 2007. Earnings per share information and footnotes are not required.

**P5-15 AICPA Adapted** *Financial Statement Deficiencies* The following is the complete set of financial statements prepared by Oberlin Corporation:

#### OBERLIN CORPORATION Statement of Earnings and Retained Earnings For the Fiscal Year Ended August 31, 2007

Sales		\$3,500,000
Less returns and allowances		(35,000)
Net sales		<u>\$3,465,000</u>
Less cost of goods sold		(1,039,000)
Gross margin		<u>\$2,426,000</u>
Less:		
Selling expenses	\$1,000,000	
General and administrative expenses (Note 1)	<u>1,079,000</u>	<u>(2,079,000)</u>
Operating earnings		\$ 347,000
Add other revenues		
Purchase discounts	\$ 10,000	
Gain on increased value of investments in real estate	100,000	
Gain on sale of treasury stock	200,000	
Correction of error in last year's statement	<u>90,000</u>	<u>400,000</u>
Ordinary earnings		\$ 747,000
Add extraordinary item—gain on sale of fixed asset		53,000
Earnings before income tax		\$ 800,000
Less income tax expense		(320,000)
Net earnings		<u>\$ 480,000</u>
Add beginning retained earnings		<u>2,690,000</u>
		\$3,170,000
Less:		
Dividends (12% stock dividend declared but not yet issued)		(120,000)
Contingent liability (Note 3)		<u>(300,000)</u>
Ending retained earnings		<u><u>\$2,750,000</u></u>

#### Statement of Financial Position August 31, 2007

<b>Assets</b>

*Notes to Financial Statements*

1. Goodwill is not being reviewed for impairment. The goodwill was "acquired" in 2007.
2. The amount, Due to Grant, Inc., is contingent upon the outcome of a lawsuit, which is currently pending. The amount of loss, if any, is not expected to exceed \$300,000.

**Required**

Identify and explain the deficiencies in the presentation of Oberlin's financial statements. There are no arithmetic errors in the statements. Organize your answer as follows:

1. Deficiencies in the statement of earnings and retained earnings
2. Deficiencies in the statement of financial position
3. General comments

If an item appears on both statements, identify the deficiencies for each statement separately.

**P5-16 AICPA Adapted** *Financial Statement Violations of GAAP* The following are the financial statements issued by Allen Corporation for its fiscal year ended October 31, 2007:

**ALLEN CORPORATION**  
**Statement of Financial Position**  
**October 31, 2007**

<b>Assets</b>	
Cash	\$ 15,000
Accounts receivable, net	150,000
Inventory	<u>120,000</u>
Total current assets	\$285,000
Patent (Note 3)	250,000
Land	<u>125,000</u>
Total assets	<u>\$660,000</u>
<b>Liabilities</b>	
Accounts payable	\$ 80,000
Accrued expenses	<u>20,000</u>
Total current liabilities	\$ 100,000
Deferred income tax payable (Note 4)	<u>80,000</u>
Total liabilities	\$ 180,000

**Stockholders' Equity**

Common stock, par \$1 (Note 5)	\$100,000	
Additional paid-in capital	180,000	
Retained earnings	<u>200,000</u>	<u>480,000</u>
Total liabilities and stockholders' equity		<u>\$660,000</u>

**Earnings Statement**  
For the Fiscal Year Ended October 31, 2007

Sales		\$1,000,000
Cost of goods sold		<u>(750,000)</u>
Gross margin		\$ 250,000
Expenses		
Bad debt expense	\$ 7,000	
Insurance	13,000	
Lease expenses (Note 1)	40,000	
Repairs and maintenance	30,000	
Pensions (Note 2)	12,000	
Salaries	<u>60,000</u>	<u>(162,000)</u>
Earnings before provision for income tax		\$ 88,000
Provision for income tax		<u>(28,740)</u>
Net earnings		<u>\$ 59,260</u>
Earnings per common share outstanding		<u>\$ 0.5926</u>

**Statement of Retained Earnings**  
For the Fiscal Year Ended October 31, 2007

Retained earnings, November 1, 2006	\$150,000
Extraordinary gain, net of income tax	25,000
Net earnings for the fiscal year ended October 31, 2007	<u>59,260</u>
	\$234,260
Dividends (\$0.3426 per share)	<u>(34,260)</u>
Retained earnings, October 31, 2007	<u>\$200,000</u>

**Notes to Financial Statements:**

- Long-Term Lease.** Under the terms of a 5-year noncancellable lease for buildings and equipment, the Company is obligated to make annual rental payments of \$40,000 in each of the next four fiscal years. At the conclusion of the lease period, the Company has the option of purchasing the leased assets for \$20,000 (a bargain purchase option) or entering into another 5-year lease of the same property at an annual rental of \$5,000.
- Pension Plan.** Substantially all employees are covered by the Company's pension plan. Pension expense is equal to the total of pension benefits paid to retired employees during the year.
- Patent.** The patent had an estimated remaining life of 10 years at the time of purchase. The Company's patent was purchased from Apex Corporation on January 1, 2007, for \$250,000.
- Deferred Income Tax Payable.** The entire balance in the deferred income tax payable account arose from tax-exempt municipal bonds that were held during the previous fiscal year, giving rise to a difference between taxable income and reported net earnings for the fiscal year ended October 31, 2007. The deferred liability amount was calculated on the basis of past tax rates.
- Warrants.** On January 1, 2006, one common stock warrant was issued to stockholders of record for each common share owned. An additional share of common stock is to be issued upon exercise of ten stock warrants and receipt of an amount equal to par value. For the six months ended October 31, 2007, the average market value for the Company's common stock was \$5 per share and no warrants had yet been exercised.
- Contingent Liability.** On October 31, 2007, the Company was contingently liable for product warranties in an amount estimated to aggregate \$75,000.

**Required**

Review the preceding financial statements and related notes. Identify any inclusions or exclusions from them that would be in violation of generally accepted accounting principles, and indicate corrective action to be taken. Do *not* comment as to format or style. Respond in the following order:

- Statement of Financial Position
- Notes
- Earnings Statement
- Statement of Retained Earnings
- General

**P5-17 Comprehensive: Comparative Income Statements** The accountant for the Tiger Company prepared comparative income statements for 2007 and 2008 as follows:

**TIGER COMPANY**  
**Comparative Statements of Income**  
**For Years Ended December 31**

	2008	2007
Sales	\$3,500,000	\$4,600,000
Cost of goods sold	(1,600,000)	(2,600,000)
Gross profit	\$1,900,000	\$2,000,000
Operating expenses	(1,300,000)	(1,500,000)
Operating income	\$ 600,000	\$ 500,000
Other items	(200,000)	100,000
Income before income taxes	\$ 400,000	\$ 600,000
Income tax expense (30%)	(120,000)	(180,000)
Net income	<u>\$ 280,000</u>	<u>\$ 420,000</u>

The auditor of Tiger Company reviewed the accounting records and income statements and discovered the facts described in items 1 and 2 below. All amounts incurred during 2007 and 2008 are included in the preceding statements.

- Included in the category "Other Items" (along with other smaller miscellaneous items) were the following:
  - A casualty loss of \$60,000 in 2007 that was considered to be both unusual and infrequent
  - A \$150,000 loss in 2008 from an unusually large write-down of inventory because of obsolescence
  - A \$250,000 gain in 2007 that was considered to be both unusual and infrequent
- On July 1, 2008, Tiger has announced its intention to sell its backscratcher division. This division is considered a component of the company. Operating results for this division are included in the company's overall operating results for 2007 and 2008, as shown previously, and are as follows:

	2008 (7/1-12/31)	2008 (1/1-6/30)	2007
Sales	\$200,000	\$400,000	\$700,000
Cost of goods sold	300,000	320,000	290,000
Operating expenses	100,000	180,000	110,000

The division had not been sold by the end of 2008, so the company classified it as held for sale. The division consisted of the following items with book values and fair values on December 31, 2008:

Item	Book Value	Fair Value
Assets	\$720,000	\$620,000
Liabilities	450,000	510,000

**Required**

Prepare corrected comparative statements of income for 2008 and 2007 for the Tiger Company. Ignore earnings per share.

**P5-18 Net Income and Comprehensive Income** At the beginning of 2007, JR Company's stockholders' equity was as follows:

Common stock, \$5 par	\$35,000
Additional paid-in capital	49,000
Retained earnings	63,000

During 2007, the following events and transactions occurred:

- The company earned sales revenues of \$108,000. It incurred cost of goods sold of \$62,000 and operating expenses of \$12,000.
- The company issued 1,000 shares of its \$5 par common stock for \$14 per share.
- The company invested \$30,000 in available-for-sale securities. At the end of the year, the securities had a market value of \$35,000.
- The company paid dividends of \$6,000.

The income tax rate on all items of income is 30%.

**Required** 

- Prepare a 2007 income statement for JR Company which includes comprehensive income (ignore earnings per share).
- Instead, prepare (a) a 2007 income statement (ignore earnings per share), and (b) a 2007 statement of comprehensive income.

3. Instead, prepare (a) a 2007 income statement (ignore earnings per share), and (b) a 2007 statement of changes in stockholders' equity that includes comprehensive income.

**P5-19 Statement of Cash Flows** A list of selected items involving the cash flow activities of the Topps Company for 2007 is presented here:

- |  |   |
|--|---|
| a. Patent amortization expense, \$3,500  | g. Preferred stock was issued for \$13,600  |
| b. Machinery was purchased for \$39,500  | h. Investments were acquired for \$21,000   |
| c. At year-end, bonds payable with a face value of \$20,000 were issued for \$17,000 | i. Accounts receivable increased by \$4,300 |
| d. Net income, \$47,200  | j. Land was sold at cost, \$11,000          |
| e. Dividends paid, \$16,000  | k. Inventories increased by \$15,400        |
| f. Depreciation expense, \$12,900  | l. Accounts payable increased by \$2,700    |
|  | m. Beginning cash balance, \$19,400         |

**Required**

Prepare the statement of cash flows of the Topps Company for 2007.

**P5-20 Statement of Cash Flows** The following are several items involving the cash flow activities of the Mueller Company for 2007:

- |   |   |
|---|---|
| a. Net income, \$68,000   | i. Payment for purchase of equipment, \$8,000     |
| b. Increase in accounts receivable, \$4,400                     | j. Receipt from sale of preferred stock, \$20,000 |
| c. Receipt from sale of common stock, \$12,300                  | k. Increase in income taxes payable, \$3,500      |
| d. Depreciation expense, \$11,300                               | l. Payment for purchase of land, \$9,700          |
| e. Dividends paid, \$24,500                                     | m. Decrease in accounts payable, \$2,900          |
| f. Payment for purchase of building, \$65,000                   | n. Increase in inventories, \$10,300              |
| g. Bond discount amortization, \$2,700                          | o. Beginning cash balance, \$18,000               |
| h. Receipt from sale of long-term investments at cost, \$10,600 |   |

**Required**

Prepare the statement of cash flows of the Mueller Company for 2007.

**P5-21 Statement of Cash Flows: Direct Method** The following are various cash flows and other information of the Trainer Company for 2007:

- |  |  |
|--|--|
| a. Payments of interest, \$5,000             | h. Payments of dividends, \$5,200                  |
| b. Depreciation expense, \$22,700            | i. Decrease in accounts payable, \$8,600           |
| c. Receipt from sale of land, \$3,100        | j. Payments to suppliers and employees, \$50,300   |
| d. Payments of income taxes, \$6,200         | k. Receipt from issuance of common stock, \$11,000 |
| e. Beginning cash balance, \$16,500          | l. Collections from customers, \$61,700            |
| f. Decrease in receivables, \$7,400          | m. Payment for purchase of investments, \$17,800   |
| g. Interest and dividends collected, \$6,300 | n. Net income, \$73,400                            |

**Required**

Using the direct method for operating cash flows, prepare the Trainer Company's 2007 statement of cash flows.

**P5-22 Comprehensive: Balance Sheet from Statement of Cash Flows** Gibb Company prepared the following balance sheet at the beginning of 2007:

<b>GIBB COMPANY</b>			
<b>Balance Sheet</b>			
<b>January 1, 2007</b>			
<i>Assets</i>		<i>Liabilities and Stockholders' Equity</i>	
Cash	\$ 1,000	Accounts payable	\$ 4,000
Accounts receivable (net)	3,900	Salaries payable	<u>1,100</u>
Inventory	4,700	Total Liabilities	\$ 5,100
Land	9,800	Common stock, \$10 par	13,500
Buildings and equipment	68,900	Additional paid-in capital	11,200
Less: Accumulated depreciation	<u>(14,100)</u>	Retained earnings	<u>44,400</u>
Total Assets	<u>\$74,200</u>	Total Liabilities and Stockholders' Equity	<u>\$74,200</u>

At the end of 2007 Gibb prepared the following statement of cash flows:

**GIBB COMPANY**  
**Statement of Cash Flows**  
**For Year Ended December 31, 2007**

<b>Net Cash Flow From Operating Activities</b>		
Net Income	\$ 5,400	
Adjustments for differences between income flows and cash flows from operating activities:		
Add: Depreciation expense	1,900	
Decrease in inventory	500	
Increase in salaries payable	400	
Less: Increase in accounts receivable (net)	(1,100)	
Decrease in accounts payable	<u>(1,000)</u>	
Net cash provided by operating activities		\$ 6,100
<b>Cash Flows From Investing Activities</b>		
Payment for purchase of building	\$(13,900)	
Receipt from sale of land	<u>3,000</u>	
Net cash used for investing activities		(10,900)
<b>Cash Flows From Financing Activities</b>		
Payment of dividends	\$ (3,100)	
Receipt from issuance of bonds	5,700	
Receipt from issuance of common stock	<u>4,500</u>	
Net cash provided by financing activities		<u>7,100</u>
Net Increase in Cash		\$ 2,300
Cash, January 1, 2007		<u>1,000</u>
Cash, December 31, 2007		<u>\$ 3,300</u>

Additional information related to the statement of cash flows:

1. The long-term bonds have a face value of \$6,000 and were issued on December 31, 2007.
2. The building was purchased on December 30, 2007.
3. The land was sold at its original cost.
4. The common stock which was sold totaled 300 shares and had a par value of \$10 per share.

**Required**

Prepare a classified balance sheet for the Gibb Company as of December 31, 2007. (*Hint:* Review the information on the statement of cash flows and the balances in the beginning balance sheet accounts to determine the impact on the ending balance sheet accounts.)

## CASES

### COMMUNICATION

**C5-1 Revenue Recognition**

A friend of yours who is not an accounting major states, "I always thought that a company recognizes revenues at the time of sale. Recently, however, I heard that there are specific criteria for revenue recognition and that included in the criteria is something about realization (whatever that means). Furthermore, I also heard that revenue may be recognized before or after the sale. Please explain revenue recognition to me."

**Required**

Prepare a written response for your friend. Include an explanation of the revenue recognition criteria and realization. Also include a discussion of the reasons for, and alternative methods of, recognizing revenue in a period other than the period of sale.

## C5-2 Expense Recognition

The FASB states that expenses are recognized according to three principles to properly match expenses against revenues.

### Required

Write a concise report that identifies the three principles, briefly explains each, and provide examples of expenses that would be recognized under each principle.

## C5-3 Cost, Expense, and Loss

**AICPA Adapted** You were requested to personally deliver your auditor's report to the board of directors of Sebal Manufacturing Corporation and answer questions posed about the financial statements. While reading the statements, one director asked, "What are the precise meanings of the terms 'cost,' 'expense,' and 'loss'? These terms seem sometimes to identify similar items and other times dissimilar items."

### Required

1. Explain the meanings of the terms (a) "cost," (b) "expense," and (c) "loss" as used for financial reporting in conformity with generally accepted accounting principles. In your explanation discuss the distinguishing characteristics of the terms and their similarities and interrelationships.
2. Classify each of the following items as a cost, expense, loss, or other category, and explain how the classification of each item may change:
  - a. Cost of goods sold
  - b. Bad debts expense
  - c. Depreciation expense for plant machinery
  - d. Spoiled goods
3. The terms "period cost" and "product cost" are sometimes used to describe certain items in financial statements. Define these terms and distinguish between them. To what types of items does each apply?

## C5-4 Results of Discontinued Operations

*FASB Statement No. 144* dealt with, among other issues, reporting the results of discontinued operations. In the *Statement*, a section of the income statement was created and several terms were defined, including "component."

### Required

Identify the elements of a company's results of discontinued operations section of its income statement. Define the previously listed term and explain how the elements of the section are computed if the company sells a component in the same accounting period that its management decided to sell the component.

## C5-5 Extraordinary Items

*APB Opinion No. 30* establishes two narrow criteria that must be met in order for an event or transaction to be classified as an extraordinary item.

### Required

1. Identify and explain each criterion.

2. Develop examples of events that might be extraordinary to one company but not extraordinary to another, such as:
  - a. An earthquake
  - b. A flood
  - c. A tornado
  - d. A severe frost
 Justify your reasoning.
3. Explain how the following are reported on a company's income statement:
  - a. An extraordinary item
  - b. An event or transaction that does not meet both criteria

## C5-6 Extraordinary Items

**AICPA Adapted** Morgan Company grows various crops and then processes them for sale to retailers. In the latter part of this year, Morgan had a large portion of its crops destroyed by a hail storm. Morgan has incurred substantial costs in raising the crops destroyed by the hail storm. Severe damage from hail storms in the locality where the crops are grown is rare.

### Required

1. Where should Morgan report the effects of the hail storm in its income statement? Why?
2. How does the classification in the income statement of an extraordinary item differ from that of an operating item? Why? Do not discuss earnings per share requirements.

## C5-7 Nonrecurring Items

**AICPA Adapted** Lynn Company sells a component of its business in the middle of the year. On the date of sale, the net proceeds received were less than the aggregate book value of the component's net assets. The component was operating at a loss from the beginning of the year.

In addition, Lynn had one of its manufacturing plants destroyed by an earthquake during the year. The loss is properly reported as an extraordinary item.

### Required

1. Explain how Lynn should report discontinued operations of a component of its business on its income statement for this year. Do not discuss earnings per share requirements.
2. What are the criteria for classification as an extraordinary item?
3. Explain how Lynn should report the extraordinary loss from the earthquake on its income statement for this year. Do not discuss earnings per share requirements.

## C5-8 Statement of Cash Flows

The president of a company, which is being audited for the first time, is concerned about all the unnecessary financial information the company is being required to disclose, and says, "We have always prepared only a balance sheet and an income statement. Surely these are enough. The only information anyone is interested in is how much we earned and what we have left. Now I am told we must prepare a statement of cash flows. What is this statement, what information

does it provide, what are the major sections of the statement, and what is included in each section (under the indirect method)?”

#### Required

Prepare a written response that answers the president’s questions.

## CREATIVE AND CRITICAL THINKING

### C5-9 Capital Maintenance

At the beginning of 1995, the Hill family organized the Hill Corporation and issued 8,000 shares of stock to family members for \$20 per share. During 1998, it issued an additional 1,600 shares of stock for \$25 per share to family members. The 9,600 shares were held by the family until the corporation was liquidated at the end of 2007. At that time the corporate assets were sold for \$600,000 and the \$50,000 of corporate liabilities were paid off. The remainder was returned to stockholders. During the 13 years of operation the corporation had a volatile operating life. It started out slowly but then increased its activities in later years. It had operated in several industry segments, being quite successful in some, not so successful in others. It had survived a major earthquake, but not without incurring significant losses. The corporation paid out dividends of \$100,000 during its lifetime.

You are a member of the Hill family who has just inherited a sizable fortune from one of your relatives. Although you were quite young during the operating life of the Hill Corporation, you are considering establishing and investing in a new corporation that operates in some of the same lines of business, provided that the corporation would be profitable. You have just received your undergraduate accounting degree and upon investigation find that, with the exception of the preceding information, all the corporate accounting records were destroyed in a recent fire. You have been told that these records were sketchy at best, but that a capital maintenance approach to income measurement might yield some useful information.

#### Required

Compute the lifetime income of the Hill Corporation and comment upon what additional information you would desire before making your investment decision.

### C5-10 Accrual Accounting

**AICPA Adapted** Generally accepted accounting principles require the use of accruals and deferrals in the determination of income.

#### Required

1. Explain how accrual accounting affects the determination of a company’s income. Include in your discussion what constitutes an accrual and a deferral, and give appropriate examples of each.
2. Contrast accrual accounting with cash accounting.

### C5-11 Ethics and Sale of Operating Component

It is the end of 2007, and, as an accountant for Newell Company, you are preparing its 2007 financial statements. On December 29, 2007, the management of Newell decided to sell one of its major divisions, subject to some legal work that is expected to be completed during the first week in April 2008 (after the 2007 financial statements have been issued). During 2007, the division earned a small operating income that is just enough for the company to report “record earnings” for the year. However, the estimated fair value of the division at the end of 2007 is less than its net book value, so that management anticipates the component will be sold at a loss.

The president of Newell stops by your office and says to you, “You have been doing a fine job. Keep up the good work, because you are heading for a promotion in early 2009. Once we report the record earnings for 2007, our stockholders and creditors will be happy. Then I think our earnings for 2008 will be high enough so that the loss we expect to report in 2008 on the sale of the division will not look so bad.” After the president leaves your office, you continue preparing the 2007 financial statements.

#### Required

From financial reporting and ethical perspectives, what information, if any, will you include about the upcoming sale of the division in the 2007 financial statements?

## RESEARCH SIMULATIONS

### R5-1 Researching GAAP

#### Situation

During 2007, one of the customers of Klote Company declared bankruptcy. This customer had been a major purchaser of Klote's products and had owed \$40,000 on account to Klote (a material portion of its receivables) at the time of bankruptcy. As a result of the bankruptcy, Klote had to write off the entire \$40,000 account receivable of the customer as a loss. The president of Klote is concerned about how to report this loss on the company's 2007 income statement. The president says, "Since this company that went bankrupt was a major customer, surely that is an unusual and infrequent event, and the \$40,000 should be reported as an extraordinary loss. What do you think?"

#### Directions

Research the related generally accepted accounting principles and prepare a short memo to the president that summarizes how to report the \$40,000 loss on Klote's 2007 income

statement. Cite your reference and applicable paragraph numbers.

### R5-2 Researching GAAP

#### Situation

The Kelly Company, a small corporation, is preparing its 2007 financial statements. At the end of 2007, the company purchased a building for \$100,000, paying \$20,000 as a down payment and signing an \$80,000 mortgage. The president of Kelly is concerned about how to report this transaction on the company's statement of cash flows and has asked you to "look into this issue for me."

#### Directions

Research the related generally accepted accounting principles and prepare a short memo to the president that summarizes how to report this transaction on the 2007 statement of cash flows. Cite your reference and applicable paragraph numbers.

## 6

## OBJECTIVES

After reading this chapter, you will be able to:

- 1 Describe an auditor's report.
- 2 Understand the meaning of an operating segment.
- 3 Describe the disclosures in a segment report.
- 4 Explain interim reporting.
- 5 Prepare an interim report.
- 6 Understand intracompany and intercompany comparisons (Appendix).
- 7 Prepare horizontal and vertical percentage analyses (Appendix).
- 8 Perform ratio analysis (Appendix).

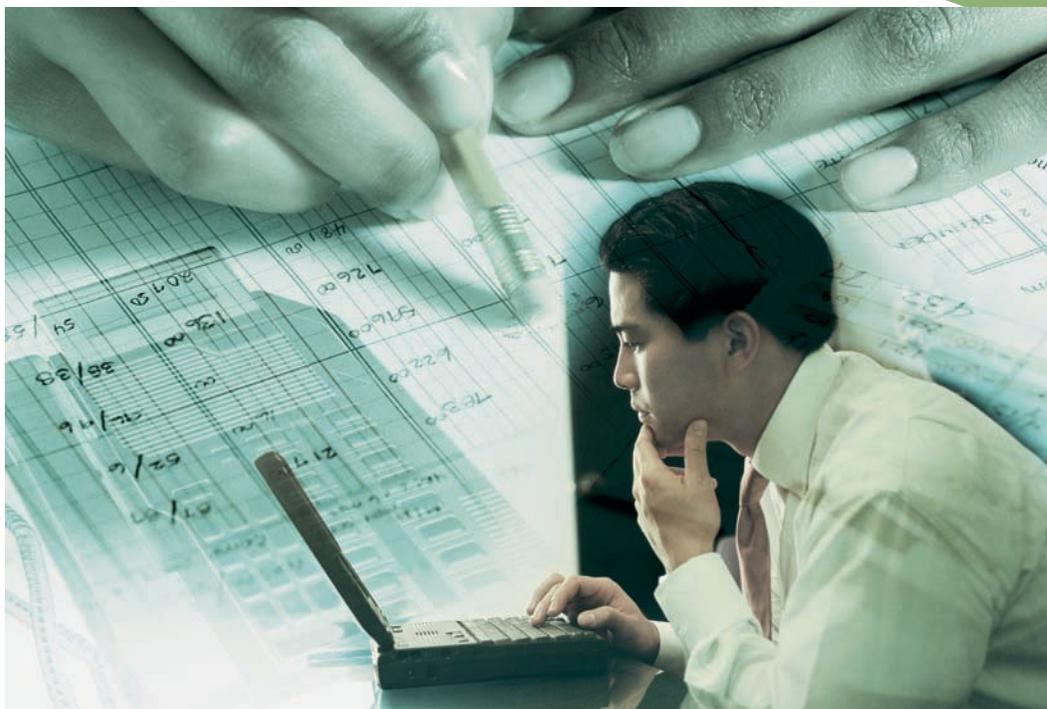

## Additional Aspects of Financial Reporting and Financial Analysis

### Can You Hear Me Now?

The rapid advancement of information technology, particularly the Internet and related technologies, has dramatically changed the way information flows between companies and users of financial information. It also presents unique opportunities and challenges for the financial reporting community. By leveraging technology, companies can provide investors with an expanded menu of relevant and timely information, such as audio and video clips of conference calls, downloadable spreadsheets that allow interactive analysis, and customer access to company databases. While the use of the Internet for financial reporting presents great opportunities, many challenges exist with regard to the quality, security, and reliability of electronic-based financial information.

Recognizing that the Internet has changed the way companies communicate with investors, creditors, and others, many have begun to embrace a technology known as **XBRL** (e**X**tensible **B**usiness **R**eporting **L**anguage) that may revolutionize financial reporting. XBRL is an Internet language for business reporting that will make it easier for users to extract and analyze information contained in annual reports, press releases, and other communications by directing that information into the many analytical tools they use. A recent forecast by a Big Four accounting firm has identified XBRL as one of the technologies that will most affect business in the coming years. With the

Credit: ©Getty Images/PhotoDisc

Securities and Exchange Commission's decision to allow voluntary filing of supplemental financial information using XBRL, its usage will almost certainly grow. The use of technologies such as XBRL should lead to improvements in communication between companies and investors and has the potential to contribute significantly to enhancing the transparency of financial reporting.

## FOR FURTHER INVESTIGATION

For a discussion of the use of technology in financial reporting, consult the Business & Company Resource Center (BCRC):

- XBRL A Work in Progress: Accountants are taking a leadership role in making a breakthrough in financial reporting. Jeff Stimpson, *The Practical Accountant*, 0032-6321, June 2004, v37, i6, p39(4).
- Tap into XBRL's Power the Easy Way: the Microsoft Office Tool for XBRL benefits all financial reporting participants. Jeffrey W. Naumann, *Journal of Accountancy*, 0021-8448, May 2004, v197, i5, p32(8).

A company's financial statements summarize its various financial activities and operations. External users analyze the information in these statements and relate it to other information for many reasons. Current stockholders, for example, are concerned about their investment income, as well as about the company's future profitability and stability. Some potential investors are interested in "safe" companies, with stable earnings and dividends, and limited or moderate growth. Others prefer companies with a trend for financial flexibility, rapid growth, and diversification into different lines of business. Short-term creditors are interested in a company's short-run liquidity—its ability to pay current obligations as they mature. Long-term creditors are concerned about the long-term security of their interest income. These are just a few of the users and uses of financial statements.

This book is designed for *preparers* of **general purpose** financial statements—statements that serve the needs of many types of external users. The information in these statements should be understandable to users who are reasonably knowledgeable about business and economic activities and who are willing to carefully study the information.<sup>1</sup> These general purpose financial statements are published in a corporation's **annual report** to its stockholders. Besides the financial statements and accompanying notes, an annual report includes many items. These include the auditor's report, the report of management, and management's discussion and analysis. Companies also prepare *interim reports*. Many companies include their financial statements and additional financial information on their web sites on the Internet. However, users should be careful because companies sometimes only provide summary information. Accountants must be familiar with these additional aspects of financial reporting.

Accountants, in the role of *preparers of financial statements*, do not themselves use the statements for investment and credit decisions. However, a better understanding of how external users analyze the data contained in the financial statements can lead to insights on how to improve that information. In some cases, companies may be required or may choose to present certain reports and analyses in their annual reports as an aid to external users, and accountants must know how to prepare these documents. Finally, accountants often are asked by management, lending institutions, and other groups to provide additional analyses of the financial statements.

We include in this chapter a discussion of (1) market efficiency, (2) the auditor's report, (3) the report of management, (4) segment reports, (5) interim reports, and (6) SEC reports. We also discuss various aspects of financial analysis, including an Appendix that covers financial analysis comparisons as well as a horizontal analysis, vertical analysis, and ratio analysis.

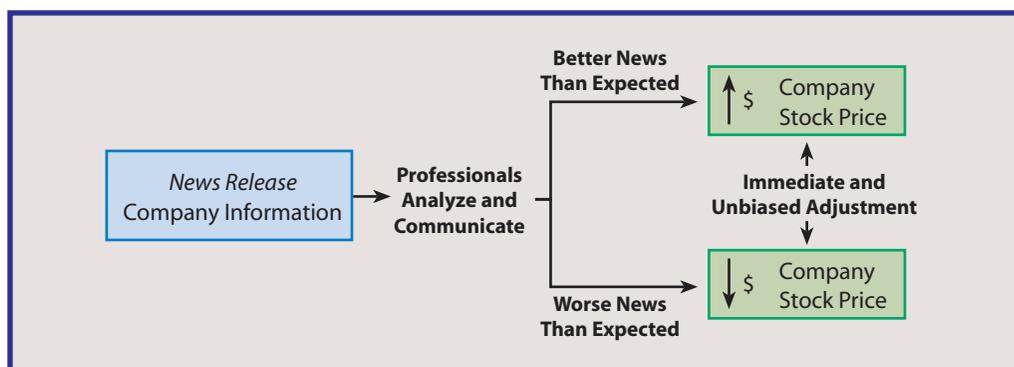

## MARKET EFFICIENCY

During the past 20 years, research studies have examined the **efficient markets** hypothesis. Evidence from this research tends to show that (1) the prices of securities traded in the capital markets fully reflect all *publicly* available information, and (2) these prices are adjusted almost *immediately* based on new information and in an *unbiased* manner. That is, as soon as new information becomes publicly available, it is interpreted, analyzed, and incorporated into the market prices. New information about companies may include, for instance, earnings amounts, cash flow and accrual components of earnings, and differences in accounting methods across companies. Information about companies becomes publicly available in a variety of ways, including news releases reported on the Internet and in newspapers such as *The Wall Street Journal*, and in published management forecasts, interim financial statements, and annual reports. The market prices adjust in an

---

1. "Objectives of Financial Reporting by Business Enterprises," *FASB Statement of Financial Accounting Concepts No. 1* (Stamford, Conn.: FASB, 1978), par. 34.

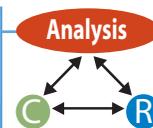

immediate and unbiased manner because of the market communication system and the sophistication of investors (professionals such as security analysts and stockbrokers) who continuously gather, interpret, analyze, and process information. We show this process in the following diagram.

An efficient capital market means that an individual investor cannot use published information to earn an “abnormal” return on a security investment with a given amount of risk. That is, all securities with a similar amount of risk will yield approximately the same rate of return; only through the use of “insider information” can abnormal returns be obtained. On the other hand, some research appears to show that the market may not always be efficient. That is, the market may be mispricing the accrual component of earnings, thereby mispricing securities and enabling an astute investor to earn an abnormal return. If the efficient markets hypothesis is reasonably valid, how does the related research affect financial reporting and financial analysis, the topics of this chapter?

Since the market efficiently processes many types of public information, **full disclosure** of financial information is important for two reasons. First, full disclosure (so that the information becomes “public”) helps to prevent the use of insider information by unscrupulous investors to earn abnormal returns. Second, full disclosure (at a reasonable cost) in the financial statements, the accompanying notes, or by other means helps the market operate efficiently and in a cost-effective fashion.

The efficiency of the capital markets does not detract from the use of various financial analysis techniques. In fact, one of the reasons why the markets tend to be efficient is because professional analysts interpret and analyze the information. Furthermore, financial analysis techniques are useful in situations where an investor is considering the investment potential of a company whose securities are *not* traded in an organized capital market, where a financial institution is considering a lending arrangement with a company, or where a company must be monitored to make sure that it is adhering to any financial restrictions set by various lending agreements. Finally, not all investors believe in the efficient market hypothesis; some continue to use financial analysis techniques to try to earn abnormal returns.<sup>2</sup>

Beaven, *Financial Reporting: An Accounting Revolution*, 3rd ed. (Upper Saddle River, N.J.: Prentice Hall, 1998).

## AUDITOR'S REPORT (OPINION)

Many investment and credit decisions are based on the information presented in a company's financial statements, which are prepared by and are the responsibility of its management. To provide an external perspective, most published financial statements are audited by an *independent* certified public accountant. In an **audit** of a public company, the certified public accountant conducts an examination of the company's internal control over its financial reporting, as well as its accounting system, records, and financial statements in accordance with generally accepted auditing standards. The Public Company Accounting Oversight Board sets these auditing standards. Based on this examination, the auditor issues an **audit report**, which expresses three opinions:

1 Describe an auditor's report.

1. That management's assessment that the company maintained internal control over its financial reporting is fairly stated
2. That the company maintained effective internal control over its financial reporting
3. That the company's financial statements present fairly the financial position of the company and the results of its operations and cash flows in conformity with accounting principles generally accepted in the United States of America.

The management of a company is responsible for maintaining internal control over the company's financial reporting. This means that the company

- has a reliable accounting system in which its transactions are appropriately recorded and stored,
- maintains records in reasonable detail that accurately reflect its transactions and events,
- has a process for providing reliable financial statements prepared according to GAAP, and
- has adequate procedures for preventing or detecting significant unauthorized acquisition, use, or disposal of its assets.

Before the company issues its financial statements, the company's management must evaluate the effectiveness of this internal control and must issue a report (we discuss this report in a later section) assessing this effectiveness.

As we noted earlier, the company's auditor then must express an opinion on whether the management's internal control assessment report is appropriate and whether the company did, in fact, maintain internal control over its financial reporting. To form a basis for issuing these opinions, the auditor must carefully examine (audit) the company's internal control system. The auditor must also audit (and issue an opinion on) the company's financial statements at the same time. This is necessary because the information obtained during the financial statement audit is relevant to the auditor's conclusion about the company's internal control over its financial reporting.

An audit report is *not* part of the financial statements because it is a report by the independent auditor. Nonetheless, it is considered an important item of information because external users place reliance on the report as to the fairness of the financial statements. The "standard" form of an auditor's report on *comparative* financial statements (often referred to as an *unqualified* report) is shown in Exhibit 6-1.<sup>3</sup> (The audit report of **The Coca-Cola Company** is shown in Appendix A at the end of this book.)

An audit report consists of five paragraphs. The first paragraph, known as the **introductory paragraph**, lists the financial statements that were audited, indicates that management's assessment of internal control was audited, declares that management is

3. Adapted from "An Audit of Internal Control Over Financial Reporting Performed in Conjunction with An Audit of Financial Statements," *Auditing Standard No. 2* (PCAOB, March 9, 2004), Example A-7.

responsible for the financial statements and related internal control, and asserts that the auditor is responsible for expressing three related opinions.

The second paragraph, known as the **scope paragraph**, describes what the auditor has done. Specifically, it states that the auditor has examined the financial statements and related internal control in accordance with generally accepted auditing standards, performed appropriate tests, and obtained an understanding of the company's internal control. The auditor does not examine all the information used to prepare the financial statements, but performs tests to evaluate the reasonableness of the information and related internal control. The auditor uses skills and judgment in deciding what evidence to examine, when to examine it, and how much to examine. As we see throughout this book, financial statements include many estimates made by management. An auditor also designs tests to evaluate the reasonableness of the assumptions and other factors used in the estimates. Because estimates are inherently imprecise, the auditor's involvement supports their reasonableness but does not guarantee their accuracy.

The third paragraph, known as the **definition paragraph**, defines internal control over financial reporting. It identifies the policies and procedures related to this internal control. The fourth paragraph, known as the **inherent limitations paragraph**, discusses the possibility that internal control over financial reporting may not prevent or detect misstatements of the financial statements. It also addresses the risk that current controls may become inadequate in the future.

The fifth paragraph, known as the **opinion paragraph**, gives the auditor's opinions. Like a doctor or lawyer, an auditor's opinion is based on professional judgment, not absolute certainty. When the financial statement opinion is unqualified, the auditor states that the financial statements present *fairly* in accordance with *generally accepted accounting principles* (GAAP). Thus the emphasis is not on presenting "fairly" in some general sense of the word but on presenting in accordance with GAAP. In other words, GAAP is defined as being fair. Therefore, the user of the financial statements must understand GAAP to be able to understand and interpret the statements. (In exceptional cases, the management of the company and the auditor may agree that a method other than GAAP provides more useful and "fairer" information about a transaction or event. In such a case, the non-GAAP method is fully disclosed.) The financial statement opinion also

**EXHIBIT 6-1 Unqualified Audit Report****REPORT OF INDEPENDENT REGISTERED PUBLIC ACCOUNTING FIRM**

We have audited the accompanying balance sheets of W Company as of December 31, 20X7 and 20X6, and the related statements of income, stockholders' equity and comprehensive income, and cash flows for each of the years in the three-year period ended December 31, 20X7. We also have audited management's assessment, included in the accompanying [title of management's report], that W Company maintained effective internal control over financial reporting as of December 31, 20X7, based on [Identify control criteria]. W Company's management is responsible for these financial statements, for maintaining effective internal control over financial reporting, and for its assessment of the effectiveness of internal control over financial reporting. Our responsibility is to express an opinion on these financial statements, an opinion on management's assessment, and an opinion on the effectiveness of the company's internal control over financial reporting based on our audits.

We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audits to obtain reasonable assurance about whether the financial statements are free of material misstatement and whether effective internal control over financial reporting was maintained in all material respects. Our audit of financial statements included examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements, assessing the accounting principles used and significant estimates made by management, and evaluating the overall financial statement presentation. Our audit of internal control over financial reporting included obtaining an understanding of internal control over financial reporting, evaluating management's assessment, testing and evaluating the design and operating effectiveness of internal control, and performing such other procedures as we considered necessary in the circumstances. We believe that our audits provide a reasonable basis for our opinions.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

(continued)

emphasizes that the statements comply with GAAP in all *material* respects; that is, the financial statements are free of material misstatements rather than precisely accurate. The paragraph concludes with the two opinions about management's assessment of the company's internal control over its financial reporting and whether this internal control was maintained by the company. An audit enhances the confidence of users because the auditor is an objective, independent expert who is knowledgeable about the company's business, internal control, and financial reporting requirements.

Note that there are three things that the audit report does *not* say. First, an unqualified opinion is not a "clean bill of health." The report does not, for example, endorse a company's policy decisions or its use of resources. Second, an unqualified opinion provides

**EXHIBIT 6-1 (Continued)**

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of W Company as of December 31, 20X7 and 20X6, and the results of its operations and its cash flows for each of the years in the three-year period ended December 31, 20X7, in conformity with accounting principles generally accepted in the United States of America. Also in our opinion, management's assessment that W Company maintained effective internal control over financial reporting as of December 31, 20X6, is fairly stated, in all material respects, based on [Identify control criteria]. Furthermore, in our opinion, W Company maintained, in all material respects, effective internal control over financial reporting as of December 31, 20X7, based on [Identify control criteria].

[Signature]

[City and State or Country]

[Date]

no assurance of the future success of the company. Generally accepted auditing standards include procedures to be followed to examine the financial viability of the company. However, a company may suffer financial difficulty, or even failure, within a relatively short time of receiving an unqualified opinion, a situation that does not necessarily indicate that the audit was negligent. In other words, there is a difference between a business failure and an audit failure. Third, although an audit assesses a company's internal controls, an audit report does not provide an assurance that fraud has not been committed by a member(s) of the company unless such fraud is material. An audit is planned and performed with professional skepticism. The auditor assesses the risk of material misstatement and designs the audit to provide reasonable assurance of detection of significant errors or fraud. However, fraud that is concealed through forgery and collusion among the personnel of the company, especially management, may escape detection by the auditor. For large companies, such fraud would have to involve millions of dollars to be material.

In certain circumstances a qualified opinion, adverse opinion, or disclaimer of opinion may be expressed by the independent auditor in any of the three opinions. A *qualified* opinion states that except for the effects of the qualified item, the internal control was maintained or the financial statements present fairly the information in conformity with GAAP. An *adverse* opinion states that the internal control was not maintained or the financial statements do not present fairly the information in conformity with GAAP. A *disclaimer* of opinion states that the auditor does not express an opinion. These types of reports and opinions are discussed more fully in standard auditing books.

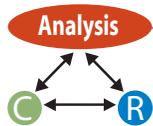

## AUDIT COMMITTEE AND MANAGEMENT'S REPORT

Audit committees have existed for many years. The SEC requires all publicly-held companies to have an audit committee. An **audit committee is a group that has oversight over the financial reporting process of a company.** Since an auditor must closely communicate with a company's management, the possibility exists that the auditor will not maintain

independence from this management. A lack of independence would reduce the reliability that external users place on the company's financial statements. Consequently, a primary responsibility of an audit committee is to help maintain auditor independence. Therefore, most audit committee members usually are "outside directors" (not officers or employees of the company). The audit committee acts as the liaison between the auditor and management. Although the duties of an audit committee vary among companies, generally an audit committee of a company: (1) oversees the internal control structure, (2) helps in the selection of accounting policies, (3) helps select the auditor, (4) approves all auditing services, (5) reviews the audit plan, (6) reviews suggestions by auditors concerning weaknesses in internal control, and (7) reviews the financial statements (both interim and annual) and audit report. Use of an audit committee enhances the credibility of a company's financial statements.

As we noted earlier, **the preparation and presentation of a company's financial statements are the responsibility of its management.** In the past, many external users have had the mistaken impression that because auditors reviewed the financial statements, the financial statements were the responsibility of the auditor. Then, if a company experienced financial difficulties that resulted in a "business failure," they erroneously thought this was an "audit failure." Consequently, officers of companies are encouraged to acknowledge their responsibilities regarding financial statements. Although not part of the financial statements, companies include a "**Management Report**" section in their annual report. In this report management acknowledges that it is responsible for preparing and presenting the financial statements. Furthermore, since sound internal control plays a vital role in these activities, the management of each public company is required to "certify" that

- the company's financial statements are not misleading and are fairly presented,
- it is responsible for designing and maintaining appropriate internal controls,
- it has evaluated the effectiveness of these internal controls and issued a report about the effectiveness of these controls, and
- it has communicated to the company's auditors and audit committee any significant deficiencies in these internal controls.

Finally, the report may identify the independent auditor's responsibilities. An example of the management report section of **Wachovia Corporation** is shown in Real Report 6-1. Note the references to management's responsibility, the auditor's role, internal control, and the reference to the auditor's reports.

### Real Report 6-1 Management's Report

#### WACHOVIA CORPORATION AND SUBSIDIARIES

##### MANAGEMENT'S REPORT ON INTERNAL CONTROL OVER FINANCIAL REPORTING

Management of Wachovia Corporation and subsidiaries (the "Company") is responsible for establishing and maintaining effective internal control over financial reporting. Internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with U.S. generally accepted accounting principles.

Under the supervision and with the participation of management, including the principal executive officer and principal financial officer, the Company conducted an evaluation of the effectiveness of internal control over financial reporting based on the framework in Internal Control – Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission. Based on this evaluation under the framework in Internal Control – Integrated Framework, management of the Company has

*Continued*

concluded the Company maintained effective internal control over financial reporting, as such term is defined in Securities Exchange Act of 1934 Rules 13a-15(f), as of December 31, 2004.

Internal control over financial reporting cannot provide absolute assurance of achieving financial reporting objectives because of its inherent limitations. Internal control over financial reporting is a process that involves human diligence and compliance and is subject to lapses in judgment and breakdowns resulting from human failures. Internal control over financial reporting can also be circumvented by collusion or improper management override. Because of such limitations, there is a risk that material misstatements may not be prevented or detected on a timely basis by internal control over financial reporting. However, these inherent limitations are known features of the financial reporting process. Therefore, it is possible to design into the process safeguards to reduce, though not eliminate, this risk.

Management is also responsible for the preparation and fair presentation of the consolidated financial statements and other financial information contained in this report. The accompanying consolidated financial statements were prepared in conformity with U.S. generally accepted accounting principles and include, as necessary, best estimates and judgments by management.

KPMG LLP, an independent, registered public accounting firm, has audited the Company's consolidated financial statements as of and for the year ended December 31, 2004, and the Company's assertion as to the effectiveness of internal control over financial reporting as of December 31, 2004, as stated in their reports, which are included herein.

### Questions:

1. What does Wachovia Corporation say about its internal controls?
2. What do you think "reasonable assurance" means?

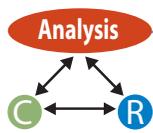

### SECURE YOUR KNOWLEDGE 6-1

- Market efficiency, the relation between security prices and information, has implications for financial reporting, including the ability to earn abnormal returns based on reported financial information, as well as the form and content of financial statement disclosures.
- To provide assurance to external users about the quality of the financial information in the financial statements, auditors examine the effectiveness of a company's internal control over its financial reporting, as well as the company's accounting system, records, and financial statements.
- The audit report consists of an introductory paragraph, a scope paragraph, a definition paragraph, an inherent limitations paragraph, and an opinion paragraph.
- The "Management's Report" section of an annual report contains management's statement of responsibility for, and certification of, the company's financial statements and internal controls relating to the financial reporting process.

## SEGMENT REPORTING

A company that has subsidiaries prepares its financial statements on a "consolidated" basis. That is, the accounting results of its various legal entities are *aggregated* into a set of financial statements for the entire economic entity (briefly discussed in Chapter 15).

Although investors and creditors know the importance of consolidated statements in evaluating overall company performance, the *disaggregation* of total financial data also can be important in their financial analysis.

The evaluations of risk and return are significant factors in investment and credit decisions. Risk may result from a number of factors including:

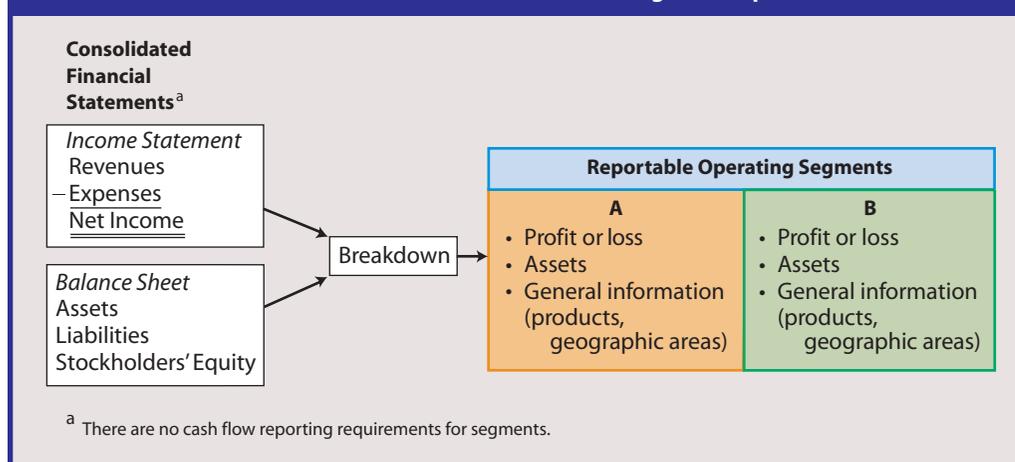

- the way that a company is organized and how its divisions are operated
- the nature of the economies in which the company operates
- the changing conditions in the geographic areas where the company operates
- the characteristics of its major customers

The profitability or return offered by a company also is affected by the same factors.

A company improves the financial analysis information on risk and return by presenting disaggregated financial information about its operating segments. The AICPA Special Committee on Financial Reporting considers operating segment reporting to be very important. It suggests that a company should provide disaggregated information on segments if they are critical “drivers” of the company’s risks and opportunities. The information reported should be based on the way in which the company uses the information for internal reporting to operate its business.<sup>4</sup>

In light of the need for operating segment information, the FASB, in cooperation with its counterpart in Canada, issued **FASB Statement No. 131**, which requires that a company’s financial statements include certain disaggregated information about its operations.<sup>5</sup> Exhibit 6-2 shows a diagram of the “breakdown” between a company’s consolidated financial statements and its reportable operating segments. In the next sections we discuss how this breakdown (disaggregation) is done.

**EXHIBIT 6-2 Consolidated Financial Statements and Segment Reports**

## Reporting on Operating Segments

A company’s financial statements might be disaggregated in a number of ways, such as by products and services, geography, legal entity, or type of customer. The way a company identifies its operating segments for financial reporting is through the use of the

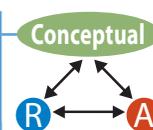

**2** Understand the meaning of an operating segment.

4. “Improving Business Reporting—A Customer Focus,” *AICPA Special Committee on Financial Reporting* (New York: AICPA, 1994), pp. 10 and 140.
5. “Disclosures about Segments of an Enterprise and Related Information,” *FASB Statement of Financial Accounting Standards No. 131* (Norwalk, Conn.: FASB, 1997), par. 1. Nonpublic companies, those whose securities are not traded publicly or that are not required to file financial statements with the SEC, are not required to report segment information.

“management approach.” The management approach is based on the way a company’s management organizes the company’s segments for making operating decisions and for assessing performance. Thus, an **operating segment is a component of a company:**

1. that engages in business activities to earn revenues and incur expenses,
2. whose operating results are regularly reviewed by the company’s chief operating officer to make decisions about allocating resources to the segment and assessing its performance, and
3. for which financial information is available.

Not all departments in a company are operating segments. For instance, a corporate headquarters normally does not earn revenues directly and is not an operating segment. Generally, an operating segment has a *segment manager* who is directly accountable for the segment’s operating activities, and who maintains regular contact with the chief operating officer.

### Reportable Segments

A company does not have to provide financial information about all its operating segments, however. Materiality determines whether or not a segment is a **reportable segment**—one whose operations are significant enough that its financial activities must be reported. An operating segment is significant and is a reportable segment if it satisfies at least *one* of the three following tests:

1. *Revenue Test.* Its reported revenues (including sales to external customers and inter-segment sales) are 10% or more of the combined revenues of all the company’s reported operating segments.
2. *Profit Test.* The absolute amount of its profit (loss) is 10% or more of the combined reported profits of all operating segments that did not report a loss.<sup>6</sup>
3. *Asset Test.* Its segment assets are 10% or more of the combined assets of all operating segments.

We discuss the terms “revenues,” “profit (and loss),” and “segment assets” as applied in this *Statement* in the next section.

In addition to these tests, there is an overall materiality test. This test requires that the reportable segments must be a substantial portion of the company’s total operations. That is, enough reportable segments must be disclosed so that their combined revenues are at least 75% of the entire company revenues. The remaining insignificant operating segments are combined and the segment information discussed in the next section is disclosed in an “all other” segment category. If a company has only one operating segment, it does not have disaggregated information to report, but it still must disclose the general information and company-wide information discussed in the next section.

### Information Reported

The disclosure requirements of *FASB Statement No. 131* are quite detailed. We summarize them as follows:

1. *General Information.* A company must (a) identify how it is organized (e.g., by product lines or geographic areas) and what factors were used to identify its operating segments, and (b) describe the types of products and services from which each reportable segment earns its revenues.
2. *Information about Profit (or Loss).* A company must report its profit (or loss) for each reportable segment. It must also disclose certain amounts used to compute each segment’s profit (or loss). These amounts are the segment’s (a) revenues (separated

**3** Describe the disclosures in a segment report.

6. If the combined losses of all operating segments that reported a loss exceed the combined profits as calculated earlier, the combined loss amount is used for this 10% test.

into sales to external customers and intersegment sales), (b) interest revenue and interest expense, and (c) depreciation, depletion, and amortization expense.<sup>7</sup>

3. *Information about Assets.* A company must report the total assets of each reportable segment. For these assets, a company also must disclose the total capital expenditures for long-lived assets of each reportable segment.
4. *Reconciliations.* A company must provide reconciliations of (a) the total of the reportable segments' revenues to the company's total revenues, (b) the total of the reportable segments' profit (or loss) to the company's pretax income from continuing operations, and (c) the total of the reportable segments' assets to the company's total assets. The revenues, profit (or loss), and segment assets of the "all other" segment category must be included in these reconciliations.
5. *Company-Wide Disclosures.* A company must disclose (a) its revenue from external customers for each product and service, and (b) information about geographic areas including (1) revenues from external customers in the United States and in individual foreign countries, and (2) total long-lived assets located in the United States and in all foreign countries. If a company's revenues from a single external customer are 10% or more of the company's total revenues, then the company must disclose this fact and identify the segment(s) reporting the revenues.<sup>8</sup>

A company is not required to follow a specific format in making the preceding disclosures. The FASB encourages a company to use a format that provides the information in the most understandable manner for its specific circumstances.

## LINK TO ETHICAL DILEMMA

After preparing the segment disclosures required for your company (a large, multinational corporation), you have been confronted by the CEO about the classifications used. Her major concern is that the extremely profitable operations in the Middle East are reported separately from the significantly less profitable European operations. Given the political climate in the Middle East, the CEO is concerned that many investors may get the mistaken impression that the company is exploiting the political and economic situation that exists. Also, the CEO argues that, from a managerial viewpoint, since the Middle Eastern operations are headquartered and managed from London, the European and Middle Eastern operations should be considered one operating segment. She instructs you to combine the two segments and revise the disclosures. What is your response to this request?

Typically, a company will include its segment report and the related narrative discussion in the notes to the financial statements in its annual report. What a company includes in this segment report depends on the approach the company uses to evaluate

7. These are the amounts for the most common items included in a company's pretax income from continuing operations. If an operating segment is evaluated using a more complex "income" measure (or on an after-tax basis), then the company must also disclose any unusual items, equity method income, other significant noncash items, and extraordinary items (and income tax expense or benefit) for each reportable segment.

8. *FASB Statement No. 131, op. cit.*, par. 18–39.

its segment managers. For instance, a company may invest excess funds and borrow funds at the “corporate level” so that any interest revenue and interest expense are not attributable to segment activities. These items, frequently called “corporate interest revenue” and “corporate interest expense,” are not assigned to each segment. Other types of corporate revenues, corporate expenses, and corporate assets related to the company’s headquarters also are not assigned to each segment.

Thus, a company frequently prepares a worksheet (based on information from internal reports) that assigns its total sales revenues, cost of goods sold, operating expenses, and assets to each operating segment. Based on these assignments, the company performs the revenue, profit, and asset tests to determine the *reportable segments*. The required financial information of the reportable segments (and the “all other” segments) then is reported separately in the company’s segment report. Because companies vary in their management approaches, it is not practical to illustrate all possible types of segment reports. We do, however, illustrate the way one hypothetical company (the Teal Company) discloses its disaggregated financial information in its annual report. The Coca-Cola Company has more extensive disclosures, which we show in Appendix A of this book.

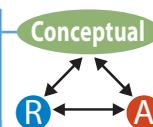

For example, assume that on its 2007 income statement, the Teal Company reports sales of \$3,800, cost of goods sold of \$2,470, and operating expenses of \$620, so that its pretax operating profit is \$710 ( $\$3,800 - \$2,470 - \$620$ ). From this pretax operating profit, the company deducts interest expense of \$80 to report pretax income from continuing operations of \$630. The company also reports total assets of \$19,000 on its December 31, 2007 balance sheet. The company’s chief operating officer uses a segment’s pretax operating profit to evaluate the segment manager; the company makes no inter-segment sales, and interest expense is considered to be incurred at the corporate level. After preparing a worksheet to assign its segment revenues (sales), operating profits (sales minus cost of goods sold and operating expenses), and assets for segment reporting, Teal determines that it has three reportable segments (A, B, and C) and several insignificant operating segments. Teal also determines that it has \$100 of general corporate expenses and \$3,000 of general corporate assets.

Example 6-1 shows the schedule and narrative discussion that Teal Company includes in its annual report. Note that the revenues and profits of the segments are reconciled to the appropriate totals on the income statement. The segment revenues are reconciled to total sales. The segment profits are reconciled to the pretax income from continuing operations by deducting the general corporate expenses and corporate interest expense. Similarly, the segment assets are reconciled to the total corporate assets.

## Conceptual Evaluation

*FASB Statement No. 131* replaced *FASB Statement No. 14*, which was issued more than 30 years ago. *FASB Statement No. 14* focused on limited reporting of disaggregated information about a company’s industry and geographic segments. During the 30-year period, external users found that they needed *more* and *better* disclosures. They argued that the disclosure of disaggregated information, along the lines that a company uses in its internal management decisions, is vital for investment and credit decision making. They felt that it is important for analysis and interpretation to be able to see the information “through the eyes of management.” Furthermore, they argued that quarterly disaggregated information would be helpful in their decisions.

The FASB agreed and issued *FASB Statement No. 131*. It stated that the disaggregated reporting requirements are intended to provide information about the different types of company operations and the different economic environments in which it operates to help users (1) better understand the company’s current and past performance, (2) better assess its prospects for future net cash flows, and (3) make more informed judgments about the company as a whole. It also requires the disclosure of certain segment information in a company’s interim reports (discussed in the next section). In other words, the

**EXAMPLE 6-1 Segment Reporting****TEAL COMPANY****Operating Segment Financial Results  
For Year Ended December 31, 2007**

	Reportable Operating Segments			All Other Segments	Total Results
	A	B	C		
Segment revenues (sales)	\$ 300	\$2,530	\$ 370	\$ 600	\$ 3,800
Segment profit (pretax)	\$ 70	\$ 495	\$ 105	\$ 140	\$ 810
General corporate expenses					(100)
Corporate interest expense					(80)
Pretax income from continuing operations					\$ 630
Segment assets at December 31, 2007	\$1,800	\$9,400	\$2,000	\$2,800	\$16,000
General corporate assets					3,000
Total assets at December 31, 2007					\$19,000

NOTES: The company is organized into three major segments, A, B, and C (describe factors identifying segments). Operations in Segment A involve production and sales of (describe types of products and services). Operations in Segment B involve production and sales of (describe types of products and services). Operations in Segment C involve production and sales of (describe types of products and services). Total revenue by segment includes sales to external customers. The company makes no intersegment sales.

Segment profit is total revenue less operating expenses. In computing segment profit, none of the following items have been deducted: general corporate expenses, corporate interest expense, or income taxes.

Depreciation for Segments A, B, and C was \$20, \$300, and \$40, respectively. Capital expenditures for the three segments were \$100, \$400, and \$200, respectively. Segment assets are those assets that are used in the company's operations in each segment. General corporate assets are principally cash, temporary investments, and corporate headquarters.

The company only makes sales in the U.S. Contracts with a U.S. government agency account for \$600 of the sales to external customers of Segment B.

FASB expects that this disaggregation will provide more *relevant* information that will improve the *feedback value*, *predictive value*, and *timeliness* of a company's financial reports.

The FASB adopted the "management approach" to disaggregated reporting to provide a viewpoint of the way a company manages its operations. Furthermore, it felt that since segment managers have a vested interest in the "quality" of the information used to evaluate them, the information is more likely to be accurate. In other words, the FASB expects the current disclosures to be more *reliable* by having more *representational faithfulness* and a higher degree of *verifiability*.

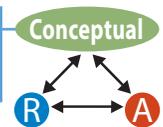

There are at least three *comparability* issues, however. First, not all companies are organized in the same way. Therefore, one company's operating segment information may not be comparable to another's. Second, companies vary as to what price a segment is charged when it "purchases" goods from another segment (this is called "transfer pricing"). So one company's intersegment sales revenue may be based on market prices, while other companies may use "full costing" or "variable costing" transfer pricing methods. Finally, if a company allocates expenses in determining each segment's profit, this must be done on a "reasonable" basis. But what is reasonable to one company may not be reasonable to another. While these issues may result in reduced comparability across companies, there is increased *consistency* for each company. On balance, the FASB feels that the current requirements for disaggregated disclosures improve the financial reporting for external users by enhancing the *decision usefulness* of the information.

## INTERIM FINANCIAL REPORTS

External users often want more frequent accounting information than that provided in the annual report. **Interim financial statements are reports for periods of less than a year.** Their purpose is to improve the *timeliness* of accounting information. These *interim reports* are issued by all publicly held companies on a quarterly basis (hence the term *quarterly financial statements*). One issue involving interim reports is the difficulty inherent in determining meaningful operating results for intervals of less than a year. Revenues of some businesses are seasonal and fluctuate widely across interim periods. Some companies incur heavy fixed costs in one interim period that benefit the operating activities in other periods. Other companies must estimate costs that will not be paid until later interim periods but that benefit the current one. Estimates also must be made of items such as inventories and income taxes if the interim reports are to be relevant and reliable.

In response to these concerns, the APB issued **APB Opinion No. 28**. This *Opinion* established the generally accepted accounting principles that apply to interim financial statements and specified the disclosures needed to present meaningful information for an interim period of less than a year. The Board was particularly concerned with reconciling two different views about interim periods. One view is that each interim period is a basic accounting period and the results of operations should be determined in the same way as if the interim period were an annual accounting period. The other view is that each interim period is an integral part of the annual accounting period. Thus, deferrals, accruals, and estimates made at the end of each interim period should consider the impact on the results of operations for the rest of the annual period. The Board concurred with the second view and concluded that **each interim period is viewed primarily as an integral part of an annual period**. Thus a company must continue to use the generally accepted accounting principles that it used in the preparation of its latest annual report. However, certain principles are modified for interim reporting purposes so that the results are more informative and articulate better with the annual report results. The FASB has issued one *Statement* (No. 131) and an *Interpretation* (No. 18) to expand and clarify various aspects of *APB Opinion No. 28*. The current generally accepted accounting principles focus primarily on the income statement items. We briefly summarize them in the following sections.

### 4 Explain interim reporting.

### Revenues

A company must recognize revenues from products or services during an interim period in the same manner (when earned and realized) as during the annual accounting period. For example, when the percentage-of-completion method is used to recognize long-term construction contracts, revenues are recorded on the basis of the percent completed during that interim period. In cases where revenues are subject to seasonal variations, the company must disclose the seasonal nature of its activities and consider presenting supplemental information regarding revenues for previous periods.

### Expenses

A company must match the expenses that are directly related to product sales or services against interim revenues in the period the revenues are recognized. These include items such as inventory costs, wages, and warranties. For inventories, a company generally must use the same inventory pricing methods (e.g., LIFO, FIFO, average) and make write-downs to market for interim reporting in the same way as it does for annual reporting, with the following exceptions:

1. A company that uses a periodic inventory system and estimated gross profit rates (or other estimation methods) to determine its cost of goods sold during interim periods must disclose the method used and any significant adjustments from reconciliation with the annual physical inventory.

2. If a company using the LIFO method has a temporary partial liquidation of its base-period inventory, but expects to replace that inventory by year-end, its cost of goods sold must include the expected cost to replace the liquidated inventory. Also, the inventory at the interim reporting date must *not* include the effect of the liquidation. Assuming rising prices, this requirement avoids the possibility of showing abnormally high interim period income due to LIFO “liquidation profits.”
3. A company must recognize a permanent loss due to an inventory market decline by using the lower of cost or market procedures in the interim period during which the decline occurred. It must recognize any recovery of such a loss in a later interim period within the same year as a gain (not to exceed the previously recognized loss) in the later period. It does not have to recognize a temporary market decline in an interim period. (We discuss the recognition of losses using lower of cost or market procedures in Chapter 9.)
4. If a company uses a standard cost accounting system, it must follow routine annual procedures for all variances. The company must disclose any significant unplanned or unanticipated purchase price or volume variances in the interim period.

Expenses that are not directly associated with product sales (or services) are matched against revenues using a variety of methods. Expenses that affect the operating activities of more than one interim period are allocated among the interim periods based on an estimate of (1) time expired, (2) benefit received, or (3) activity associated with the periods. These allocations must be consistent with those used for annual reporting purposes. For example, accrued or deferred property taxes, advertising costs, depreciation charges, and uncollectible accounts (bad debts) expense are allocated among the interim periods. Expenses that relate only to the current interim period are allocated to that period. No arbitrary allocations are allowed. For example, office utilities, rent expense, and interest costs are expensed as incurred in the interim period. Gains and losses that occur in an interim period and that would not be deferred at year-end are recognized in that interim period. For example, a gain on the sale of land or a loss on the disposal of equipment is recognized in the interim period.<sup>9</sup>

## Income Taxes

To present fairly the results of operations, at the end of *each* interim period a company must make its best estimate of the effective income tax rate expected to apply for the *entire* year. The effective rate includes the appropriate tax rate on *annual* income from continuing operations. In determining the rate, the company does not consider the income tax related to any items (such as extraordinary items) that are reported separately net of income taxes. Consequently, each quarter the company estimates its annual income from continuing operations and, based on this annual income, estimates its annual income taxes to derive an effective annual income tax rate. It then uses the effective rate to compute the income taxes related to income from continuing operations on a year-to-date basis. The amount of income taxes for the current interim period is the difference between the income tax computed on year-to-date income from continuing operations and the related income taxes reported on previous interim reports of the accounting period.<sup>10</sup> This procedure must be completed for each of the four interim periods; it follows the general principle of intraperiod tax allocation.

For example, assume Trull Corporation reported pretax income from continuing operations of \$20,000 at the end of the first quarter and estimated its income tax on this income to be \$5,220. (This estimate was made at the end of the first quarter, using the

9. “Interim Financial Statements,” *APB Opinion No. 28* (New York: AICPA, 1973), par. 11–15.

10. “Accounting for Income Taxes in Interim Periods,” *FASB Interpretation No. 18* (Stamford, Conn.: FASB, 1977), par. 9.

technique discussed previously.) The corporation now is preparing an interim income statement at the end of the second quarter for that quarter and the first six months. It determines that its pretax income from continuing operations for the second quarter is \$26,000 and estimates it will earn \$25,000 and \$29,000 in each of the next two quarters, respectively. The corporate income tax rates are 15% on the first \$20,000 of earnings and 30% on earnings in excess of \$20,000. As we show in Example 6-2, based on an estimated effective income tax rate of 27%, Trull Corporation lists income tax expense of \$12,420 for the first six months and \$7,200 for the second quarter of operations.

#### EXAMPLE 6-2 Computation of Interim Income Taxes

##### 1. Estimated Annual Income

First quarter	\$ 20,000	actual income
Second quarter	26,000	actual income
Third quarter	25,000	estimated income
Fourth quarter	<u>29,000</u>	estimated income
	<u>\$100,000</u>	estimated annual income

##### 2. Estimated Effective Income Tax Rate

$$\begin{aligned}
 15\% \times \$20,000 &= \$ 3,000 \\
 30\% \times (\$100,000 - \$20,000) &= \underline{24,000} \\
 \text{Estimated total tax} &= \$27,000 \\
 27\% \text{ Effective income tax rate} &= \frac{\$27,000 \text{ Estimated income tax}}{\$100,000 \text{ Estimated income}}
 \end{aligned}$$

##### 3. Estimated Income Tax for First Six Months

$$\$46,000 \times 27\% = \underline{\$12,420} \text{ estimated income tax on first six months' income}$$

##### 4. Estimated Income Tax for Second Quarter

$$\begin{aligned}
 \$12,420 &\text{ estimated income tax on first six months of income} \\
 \underline{(5,220)} &\text{ estimated income tax on first-quarter income} \\
 \underline{\$ 7,200} &\text{ estimated income tax on second-quarter income}
 \end{aligned}$$

## Extraordinary Items and Discontinued Operations

Material extraordinary items and results of discontinued operations are reported (net of income taxes) in the usual manner in the interim period during which the events occurred. None of these items is prorated over the entire annual accounting period. Materiality, however, is determined on the basis of a relationship of the item to the estimated income for the entire *year* and not to the interim period results.

## Earnings per Share

Earnings per share is computed for each interim period presented. In its simplest form, earnings per share is computed by dividing the net income by the average number of common shares outstanding for the accounting "period." The quarter (or year-to-date for longer periods) is considered the accounting period. The resulting earnings per share is reported on the face of the interim income statement. A breakdown of earnings per share related to income from continuing operations, results of discontinued operations, and extraordinary items is also disclosed.

Companies must be careful in disclosing comparative interim earnings per share because of differences arising from the short time periods. Shares issued in the second quarter result in a different number of outstanding shares than in the first quarter, making it difficult for a user to predict an annual earnings per share. Similarly, an extraordinary loss occurring in the fourth quarter affects earnings per share for that quarter and the year but does not affect the earnings per share listed in the first three quarters.

### Preparation and Disclosure of Summarized Interim Financial Data

#### 5 Prepare an interim report.

The accounting procedures a company uses to prepare its interim reports are similar to those for annual reports. Typically, a trial balance of the year-to-date account balances is prepared. The trial balance is entered on a worksheet, spreadsheet, or other working paper. Year-to-date adjusting entries are recorded on the working paper, after which the year-to-date financial statements are prepared. However, the interim accounting procedures differ in several respects from those completed at year-end.

First, for a company using a periodic inventory system, the ending inventory for the interim reports is usually based on an estimation technique rather than on a physical inventory. Thus, the gross profit method, retail inventory method, or some other estimation technique is used to estimate the ending interim inventory to be recorded on the working paper and reported in the financial statements. Second, the adjusting entries required at the end of the interim period to bring the accounts up to date usually are recorded only on the working paper and are not entered into the accounts. When this approach is used, only at the end of the year are the annual adjusting entries journalized and posted to the accounts.

Third, the accounts are not closed at the end of each interim period. Consequently, in an interim period subsequent to the first period, a company must be careful not to include amounts applicable to previous interim periods in the revenue and expense accounts. To avoid this problem, as we mentioned previously, a company typically prepares the interim income statement on a year-to-date basis and then eliminates the income statement results from any previous interim periods. For example, at the end of six months, a company would prepare a half-year income statement and then “back out” (subtract) the first-quarter income statement results to determine the second-quarter income statement. Finally, interim reports typically are not audited (except for SEC reports) because of the time and cost involved. However, auditing procedures have been developed for cases where an accountant is engaged to review a company’s interim financial information.

While the APB recognized the advantages to users of more timely information in interim reports, it also felt that this advantage may be partially offset by the lesser amount of detail in the interim reports. Thus, it provided guidelines regarding *minimum* disclosure. When publicly held companies report interim summaries of financial information, the following data must be reported at a minimum: (1) sales or gross revenues, income taxes, extraordinary items (net of tax), and net income; (2) earnings per share for each period presented; (3) seasonal revenues, costs, and expenses; (4) significant changes in estimates of income taxes; (5) results of discontinued operations and material unusual or infrequent items; (6) contingent items; (7) changes in accounting principles<sup>11</sup> or estimates; and (8) significant changes in financial position (i.e., cash flows).

When a company presents the preceding information on a quarterly basis, it also provides current year-to-date information, along with comparable data from the previous year. Companies are encouraged to provide condensed balance sheet and cash flow data for the interim periods to assist external users in their analyses of *financial flexibility* and *liquidity*. When this information is not presented, a company must report any significant changes since the last reporting date in liquid assets, working capital, long-term liabilities,

11. APB Opinion No. 28 established certain guidelines for reporting accounting changes in interim reports. These guidelines are not discussed in this chapter. As a result of difficulties in interpretation, FASB Statement of Financial Accounting Standards No. 154, “Accounting Changes and Error Corrections” (Norwalk, Conn.: FASB, 2005), clarified the reporting of such changes, and is discussed in Chapter 23.

and stockholders' equity. A company also must disclose selected information about each of its reportable operating segments. This information includes items such as segment revenues from external customers, intersegment revenues, segment profit or loss, and segment assets.<sup>12</sup> The SEC requires more extensive interim disclosures, as we discuss later in the chapter. Although interim financial statements are too lengthy to illustrate here, The Coca-Cola Company includes quarterly data at the end of the notes to its financial statements, as we show in Appendix A to this book.

## SECURE YOUR KNOWLEDGE 6-2

- A company reports disaggregated financial information for any significant operating segments to help external users better understand the way in which it manages its operations.
- While no specific format is specified, extensive disclosures are required that include information on how a company is organized, the types of products and services of each reportable segment, the income and assets of each reportable segment, and how segment data reconciles to company-wide data.
- To provide more timely information, a company prepares interim financial reports that are viewed as an integral part of its annual reporting period.
- The preparation of interim financial reports requires the modification of certain generally accepted accounting principles to provide more meaningful reports that articulate with the annual report.

## SEC REPORTS

The Securities and Exchange Commission (SEC) was created to administer various securities acts under powers provided by Congress in the Securities Act of 1933 and the Securities Exchange Act of 1934. The intent of Congress was to regulate the disclosure of all significant financial information provided by companies issuing publicly-traded securities (e.g., stocks and bonds). The SEC has the legal authority to prescribe accounting principles and reporting practices for these regulated (publicly-held) companies.

The SEC is a large organization with headquarters in Washington, D.C. Among the administrative offices, the **Office of the Chief Accountant** is important to accountants because it is responsible for providing the SEC with advice concerning accounting and auditing. The *Chief Accountant* helps to establish administrative policies regarding accounting matters. This office is directly responsible for *Regulation S-X* (which establishes the form and content of financial statements filed with the SEC), and is primarily responsible for the *Financial Reporting Releases* (which prescribe accounting principles for regulated companies). Among the divisions, the **Division of Corporation Finance** is also important to accountants. This division is responsible for assisting in the establishment of reporting standards (except those directly related to financial statements, which are the responsibility of the Chief Accountant) and the requirements for adherence to these standards by regulated companies. The division is also responsible for reviewing the financial reports submitted to the SEC by regulated companies. Since all these reports generally must be certified by a certified public accountant, an understanding of its activities is useful to accountants responsible for filing them.<sup>13</sup>

12. *FASB Statement No. 131, op. cit.*, par. 33.

13. For a more extensive discussion of the history and administrative responsibilities of the various segments of the SEC, see K. F. Skousen, S.M. Glover, and D.F. Prawitt, *An Introduction to Corporate Governance and the SEC* (Mason, Ohio: South-Western Publishing Company, 2005).

Numerous forms are required to be filed with the SEC by regulated companies. Two forms that are important to accountants are:

- *Form 10-K*. An annual report.
- *Form 10-Q*. A quarterly report of operations.

### Form 10-K

**Form 10-K is used to report a company's annual financial information to the SEC** and is required to be filed within 60 days of a company's fiscal year-end. The SEC separates its required financial information in Form 10-K into two types: (1) information that must be reported *both* in annual reports filed with the SEC and annual reports issued to stockholders, and (2) information required to be filed only with the SEC.

Information of the first type includes items such as the financial statements, notes, management's discussion and analysis (MD&A), and market information on the company's common stock. This information can be included in Form 10-K by *reference* to the company's annual report issued to stockholders. Note, however, that all the information *must* be included in the annual report. Thus, for instance, many companies include an MD&A as well as three years of comparative financial statements in their stockholders' annual reports. Some regulated companies (e.g., The Coca-Cola Company) no longer publish a separate stockholders' annual report but only publish their Form 10-K. The second type of information (required to be filed only with the SEC) is considered to be important primarily to a limited and sophisticated group of users (e.g., security analysts). This type includes items such as directors and officers, executive compensation, legal proceedings, and voting matters.

### Form 10-Q

**Form 10-Q is used to report a company's quarterly financial information to the SEC** and is required to be filed within 35 days of the end of each of the company's first three fiscal quarters. It contains similar disclosures to that of Form 10-K, but includes only quarterly and year-to-date information. The accounting principles established in *APB Opinion No. 28, "Interim Financial Reporting,"* discussed earlier in the chapter, are used to prepare the Form 10-Q disclosures, so that this financial information is very similar to that provided in a company's quarterly report to stockholders. However, it may be more extensive because the SEC *requires* the presentation of comparative interim financial statements.

### XBRL Supplemental Information

All companies are required to file Form 10-K and Form 10-Q electronically according to the EDGAR requirements. In addition, the SEC allows companies to voluntarily submit some or all of this electronically-transmitted financial information in XBRL (eXtensible Business Reporting Language). A financial report prepared using the XBRL format includes an identifying "tag" for each individual item (e.g., sales revenue, cost of goods sold) in the report. This allows computer software to recognize and extract items of information in the report in "real time" for various analytical purposes. For instance, the software can provide external users with virtually instantaneous comparisons of a company's operating results for the current year with its results from previous years or with the results of other companies. Although XBRL reporting is in its early stages, it is likely that more financial information will be transmitted to external users under this format. For more details on XBRL see <http://www.xbrl.org>.

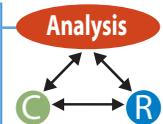

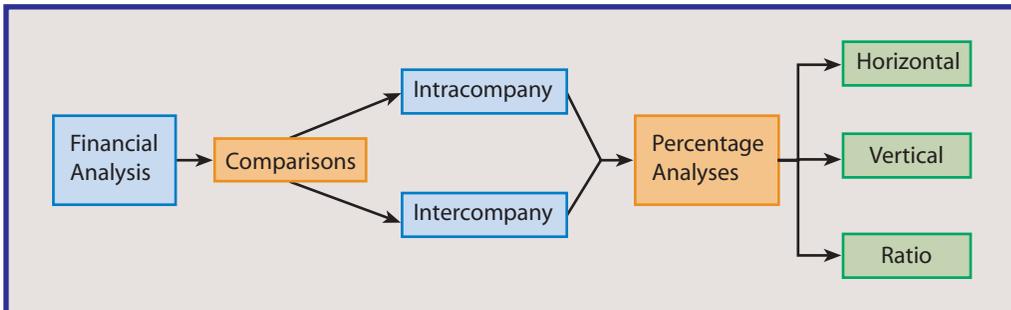

## LINK TO INTERNATIONAL DIFFERENCES

International accounting standards differ somewhat from U.S. accounting standards for both segment reporting and interim reporting. Segment reporting is required under international accounting standards, but reportable segments are identified differently than under U.S. standards. Under international standards, segments are reported as either business segments or geographic segments. A business segment is a component of a company that provides goods or services that are different from other business segments as to risks and returns. A geographic segment is a component of a company that provides goods or services within a particular economic environment that are different from other geographic segments as to risks and returns. International and U.S. standards require a company to make similar segment disclosures (e.g., segment profit or loss, revenues, assets), but there are some differences in measurement and reporting requirements. For instance, a company (1) measures its segment profit (or loss) under international standards in the same way as it reports its consolidated income (as opposed to the management approach in the United States) and (2) includes in segment revenues and segment assets any reasonably allocated items (as opposed to the management approach). International standards also require a company to disclose each segment's liabilities and encourages segment cash flow disclosures.

International accounting standards provide guidance for what to include in an interim report, but do not specify which companies must publish them or how frequently. Public companies, however, are encouraged to provide at least half-year reports. If a company issues an interim report, under international standards it is required to include a condensed balance sheet, income statement, cash flow statement, statement of changes in equity, and selected explanatory notes. However, international standards differ from U.S. standards in that they do not allow (1) the allocation of expenses between interim periods, (2) the deferral of manufacturing variances that are expected to be offset in a later interim period, or (3) the deferral of a temporary market decline in inventory that is expected to be recovered in a later interim period.

## APPENDIX: FINANCIAL ANALYSIS COMPARISONS

This Appendix deals with various tools of financial analysis. The following diagram depicts financial analysis and its related tools that we discuss in later sections.

Before we discuss preparing these financial analyses, it is helpful to know how this information is used. The decision process of external users may be summarized as follows:

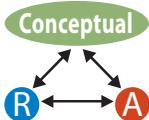

1. External users examine the current financial reports for information important to them.

2. They look for criteria that will assist them in analyzing the reports and making decisions; usually, although not exclusively, they make comparisons with a particular company's past results as well as with similar companies within the same or related industries.
3. They make their decision.
4. They evaluate their decision based on feedback.

## INTRACOMPANY COMPARISONS

### 6 Understand intracompany and intercompany comparisons.

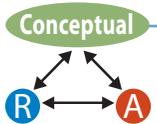

One method of evaluating a company's current financial performance and condition is to compare them with the company's past results. This is called **intracompany comparison**. An important issue in this type of comparison is the evidence of **trends**—indications that a company's performance is stable, improving, or deteriorating, not only in the short run but also in the longer run. Most companies now present at least 2 years of comparable data in their financial statements. Many also include 5-, 10-, or 15-year summaries of key financial data.

A critical point to remember when preparing financial analysis information for use in intracompany comparisons is the need for **consistency** over time. Whether a company prepares operating segment information, interim data, percentage analyses, ratios, or SEC reports, each year's information should be consistently presented so that valid and reliable comparisons may be made.

## INTERCOMPANY COMPARISONS

A second method of evaluation is to compare a company's performance with that of competitors, with the industry as a whole, or with the results in related industries. This is known as **intercompany comparison** and may be made for a single period or for several past periods. A competitor's financial information may be obtained from its respective financial statements. Information on the performance of the industry as a whole or of related industries may be based on compilations of financial information by such financial analysis companies as Moody's Investors Service, Standard and Poor's, Dun and Bradstreet, and Robert Morris and Associates. These companies not only provide information from annual reports but also publish periodic updates and supplements. Other organizations and trade associations supply similar information on a more selective basis. Much of this information is available on the Internet.

A user preparing financial analysis information for an intercompany comparison is concerned not only with consistency over time, but also with comparability of data across companies. A preparer of a company's financial information cannot control the consistency of data across other companies. Nevertheless, the preparation of this data should take into consideration such factors as the use of comparable numbers in the numerator and denominator of financial ratios, the use of common industry classifications in the development of operating segment results, and the impact of different generally acceptable accounting practices (for example, LIFO versus FIFO for inventory costing or accelerated versus straight-line depreciation) on the results. When preparing financial analysis data, an accountant should be aware that this information may be used in both intracompany and intercompany comparisons.

## PERCENTAGE ANALYSES

### 7 Prepare horizontal and vertical percentage analyses.

The comparison of a company's operating results and financial position across several periods or with other companies may be enhanced by converting the monetary amounts in the financial statements to percentage relationships. The three types of analyses that use percentage relationships are called horizontal analysis, vertical analysis, and ratio analysis. We discuss the first two in this section and discuss ratio analysis in the following section.

## Horizontal Analysis

In horizontal analysis, a company shows the changes in its operating results and financial position *over time* in percentages as well as in dollars. This method is usually used with the income statement. Horizontal analysis sometimes is used for balance sheet comparisons. It is used less frequently in the analysis of the statement of cash flows because many items do not recur consistently on this statement.

When only two years of comparative data are disclosed in percentages, the earlier year is used as the base year and the amount of change in each item is shown as a percentage of that item's base-year amount. When data are shown for more than two years, two alternative approaches may be used. In the first approach, the preceding year is used as the base year for each later year, and the percentage change from year to year is shown. Column (1) of Example 6-3 shows this "year-to-year" approach for the Cooper Company. Although this approach identifies and highlights year-to-year changes, a user cannot easily analyze the relative changes over an extended period. Because different years are used as bases, it is not possible to add the changes from year to year to determine the total cumulative change. For this type of analysis, a second approach may be used. Here, the *initial* year is used as the base year, and the cumulative results from later years are compared with the initial year to determine the cumulative percentage changes. Column (2) of Example 6-3 shows this "base-year-to-date" approach for the Cooper Company. With this approach, if a weak initial year is selected, the cumulative percentage changes appear stronger than may be warranted.

Whenever horizontal analysis is used, a company must be careful in computing and interpreting percentage changes. If a base figure is zero or negative, although an *amount* of change may be shown, *no percentage* change may be validly expressed. Also, in cases where changes are shown as percentages, no vertical addition or subtraction of the percentages (as we discuss in the next section) can be made because the percentage changes result from the use of different bases. Finally, for items with small base amounts, a relatively small dollar change may result in a very high percentage change, thus potentially making the item more significant than may be warranted.

## Vertical Analysis

In vertical analysis, a company shows the monetary relationships between items on its financial statements for a particular *period* in percentages as well as in dollars. When vertical analysis is used for comparisons of financial statements from several periods, trends or changes in the relationships between items are more easily identified. Financial statements shown only in percentages are referred to as **common-size statements**.

Vertical analysis may be used with the income statement, retained earnings statement, balance sheet, or the statement of cash flows. In the case of the income statement, net sales usually are expressed as 100% and all other components are expressed accordingly. On the balance sheet, total assets represent 100%; on the retained earnings statement, beginning retained earnings is 100%; and for the statement of cash flows, the increase in cash is usually expressed as 100%. Examples 6-4 and 6-5 show vertical analyses for the Cooper Company.

Both vertical and horizontal analysis may be used with interim reports and reports of the results of operating segments. Vertical and horizontal analyses also are used with ratio analysis.

## RATIO ANALYSIS

Another form of percentage analysis involves the use of ratios. Ratios involve the division of one or more items on the financial statements by another related item or items. They are frequently used to evaluate the financial aspects (i.e., return, risk, financial flexibility, liquidity, and operating capability) of a company. Many ratios have become standardized. They are

**EXAMPLE 6-3 Horizontal Analyses****COOPER COMPANY****Comparative Income Statements**

	For Years Ended December 31,			(1) Year-to-Year Increase (Decrease)				(2) Base-Year-to-Date Increase (Decrease)

\*Rounded to balance.

useful indicators of financial performance and are computed routinely and published on a company and industry basis by financial analysis companies. These ratios become “benchmarks” against which to compare a company’s results to evaluate its effectiveness. The ratios are used by different external users in intracompany and intercompany comparisons for many economic decisions. Other ratios are developed by individual users or user groups for their own specific needs.

There are more than 30 different ratios or variations of ratios for financial analysis. However, we focus on the primary standard ratios, some of which we briefly discussed in earlier chapters. These may be classified into six groups: (1) stockholder profitability ratios, (2) company profitability ratios, (3) liquidity ratios, (4) activity ratios, (5) stability ratios, and (6) cash flow ratios. We briefly discuss how to compute and use each ratio in the following sections. The 2008 data for the computation of these ratios is included in Examples 6-4 and 6-5 for the Cooper Company. Since we do not discuss the calculations of these ratios in the text, you should refer to these exhibits to identify the numbers used for each ratio.

**8** Perform ratio analysis.

†December 31, 2008 market price is \$14.25 per share.

## Stockholder Profitability Ratios

Stockholder profitability ratios are used to evaluate how effective a company has been in meeting the profit (i.e., return) objectives of its owners. Example 6-6 shows several stockholder profitability ratios, along with the calculations for the Cooper Company. We discuss each ratio in the following sections.

### Earnings Per Share

Earnings per share is probably the most frequently cited ratio in a financial analysis. It is considered important enough to be a required disclosure on the face of a company's income statement. As its name indicates, it shows the amount of earnings attributable to each share of common stock held by stockholders.

### Price/Earnings

Although not precisely a stockholder profitability ratio, the price/earnings ratio is used by actual and potential stockholders to evaluate the attractiveness of an investment in the stock of a company. A higher price/earnings ratio compared to other similar companies may indicate that investors perceive expansion potential for the company. Be careful, however, that the comparison is made to other "similar" companies. The price/earnings ratios for companies in "growth" industries, such as the electronics industry, are likely to be higher than for, say, companies in the automobile or steel industries. Interpretation of the

ratio also is affected by investors' perceptions of the company's quality and trend of earnings, relative risk, use of alternative accounting methods, and other factors. Earnings per share based on income from continuing operations usually is used as the denominator.

### Dividend Yield

The market value of a company's stock represents the value a stockholder must forgo to continue holding the security. Stockholders are interested in their individual rates of return based on the actual dividends received as compared with the ending market price (or market price on another particular date) of the stock. The dividend yield provides this information. The dividend yield, combined with the percentage change in the market price of the stock held during the period, is the total annual return on the stockholders' investment.

#### EXAMPLE 6-6 Stockholder Profitability Ratios

Ratio	Formula	Calculations (2008)
1. Earnings per Share	$\frac{\text{Net Income} - \text{Preferred Dividends}}{\text{Average Common Shares Outstanding}}$	$\frac{\$11,000 - \$1,200}{5,400} = \$1.81$
2. Price/Earnings	$\frac{\text{Market Price per Common Share}}{\text{Earnings per Share}}$	$\frac{\$14.25}{\$1.81} = 7.9 \text{ times}$
3. Dividend Yield	$\frac{\text{Dividends per Common Share}}{\text{Market Price per Common Share}}$	$\frac{\$1.00}{\$14.25} = 7.0\%$

### Company Profitability Ratios

Company profitability ratios are used to evaluate how effective a company has been in meeting its overall profit (return) objectives, particularly in relation to the resources invested. Example 6-7 shows several overall company profitability ratios, along with the calculations for the Cooper Company. We discuss each ratio in the following sections.

#### EXAMPLE 6-7 Company Profitability Ratios

Ratio	Formula	Calculations (2008)
1. Profit Margin	$\frac{\text{Net Income}}{\text{Net Sales}}$	$\frac{\$11,000}{\$130,000} = 8.5\%$
2. Return on Total Assets	$\frac{\text{Net Income} + \text{Interest Expense (net of tax)}}{\text{Average Total Assets}}$	$\frac{\$11,000 + (\$3,000 \times 0.7)}{\frac{\$129,200 + \$112,000}{2}} = 10.9\%$
3. Return on Stockholders' Equity	$\frac{\text{Net Income}}{\text{Average Stockholders' Equity}}$	$\frac{\$11,000}{\frac{\$93,000 + \$79,000}{2}} = 12.8\%$

### Profit Margin

The relationship of net income to net sales commonly is used to evaluate a company's efficiency in controlling costs and expenses in relation to sales. That is, the lower a company's expenses relative to sales, the higher the sales dollars remaining for other activities.

If a company has nonrecurring items of income, income from continuing operations typically is used as the numerator. The reporting of segment information permits a variation of this ratio to be computed for the major operating segments of a company. For each reportable segment, the profit margin *before* income taxes can be computed by dividing the segment's profit by its revenues. A weakness of the ratio is that it does not consider the investment (the total assets or stockholders' equity) necessary to generate the sales and income. A "return on investment" ratio (either total assets or stockholders' equity) overcomes this weakness.

### Return on Total Assets

The amount of net income earned in relation to total assets indicates how efficiently a company uses its economic resources. When a comparison is made of the return on total assets of one company to the return of another company, the age of the assets of each company should be considered. That is, the return on a company's assets will get higher as the assets become older because the denominator will decrease each year due to the increase in accumulated depreciation. Also, since prices tend to increase due to inflation, a company that uses recently purchased assets will tend to show a relatively lower return on these assets. Typically, extraordinary items and results of discontinued operations are excluded from the numerator because they are the result of infrequent events not directly related to a company's ongoing operations. Interest expense (after income taxes)<sup>14</sup> is added back to net income because it is a financial cost paid to creditors to acquire the assets as opposed to a cost of generating sales. Since net income is earned over the entire period, the *average* total assets (beginning plus ending assets divided by two) for the period are used as the denominator. Reporting the results of segments permits the computation of a variation of this ratio for the major operating segments of a company. For each reportable segment, the *pretax* return on the segment's assets can be computed by dividing the segment's profit by its total assets.

### Return on Stockholders' Equity

Net income may be divided by stockholders' equity to show the residual return on the owners' equity. When this return is higher than the return on total assets, the company has favorable financial leverage (that is, it is trading on the equity, which we discuss later). A weakness of the return on stockholders' equity ratio (as well as the return on total assets ratio), however, is that it does not consider the current value of the capital invested, since financial statements are based primarily on historical cost. Extraordinary items and other nonrecurring items usually are excluded from the numerator, and *average* stockholders' equity typically is used for the denominator. Some companies deduct preferred dividends from net income and use only common stockholders' equity in this ratio. They argue that preferred stock is more similar to long-term liabilities than it is to common stock.

## Liquidity Ratios

Liquidity ratios are used to evaluate a company's ability to meet its currently maturing financial obligations. These ratios generally involve all or most of the components of a company's working capital, its current assets less its current liabilities. Current assets include cash, temporary investments, receivables, inventories, and prepaid items. Current liabilities include items such as accounts payable from the normal acquisition of goods

---

14. After-tax interest expense is usually computed by multiplying the pretax interest expense by 1 minus the effective income tax rate. In the case of the Cooper Company, the effective tax rate approximates 30% ( $\$4,700 \div \$15,700$ ), so that the \$3,000 pretax interest expense is multiplied by 70% ( $1 - 0.30$ ) to determine the after-tax results.

or services; accruals for wages, taxes, and interest payable; short-term notes payable; advance collections of unearned revenues; and the currently maturing portion of long-term debt. Example 6-8 shows the common liquidity ratios, along with the calculations for the Cooper Company. We discuss each ratio in the following sections.

#### EXAMPLE 6-8 Liquidity Ratios

Ratio	Formula	Calculations (2008)
1. Current Ratio	$\frac{\text{Current Assets}}{\text{Current Liabilities}}$	$\frac{\$21,400}{\$11,200} = 1.91 \text{ times}$
2. Acid-Test Ratio	$\frac{\text{Quick Assets}}{\text{Current Liabilities}}$	$\frac{\$11,500}{\$11,200} = 1.03 \text{ times}$

### Current Ratio

The current ratio probably is the most commonly used ratio to evaluate a company's short-run liquidity. Sometimes it is referred to as the *working capital ratio*. It is considered to be a better indicator of a company's current debt-paying ability than simply working capital. This is because working capital shows only the absolute difference between a company's current assets and its current liabilities. By computing the current ratio, the *relative* relationship between the current assets and current liabilities is known, so that comparisons of different-sized companies can be made. In the past, as a "rule of thumb," a 2.0 current ratio was considered satisfactory. Today, however, more attention is given to (1) industry practices, (2) the length of a company's operating cycle, and (3) the mix of the current assets. Too *high* a current ratio relative to similar companies within the same industry may indicate inefficient management of current assets. The shorter a company's operating cycle, the less likely it is to need much working capital, or as high a current ratio, to operate efficiently. A company's operating cycle is evaluated through the use of activity ratios, which we discuss in the next section. The proportion of different items that make up the total current assets is referred to as the "mix" of the current assets. This mix has an effect on how quickly the current assets can be converted into cash. As an extreme, a high proportion of prepaid items in current assets may indicate a weak liquidity position, since prepaid assets are consumed within the operating cycle rather than converted back into cash. The mix of a company's current assets and the impact on its liquidity are considered in the acid-test ratio.

### Acid-Test Ratio

The acid-test or *quick* ratio is a more severe test of a company's short-term debt-paying abilities. In this ratio, only the current assets that may be easily converted into cash are used in the calculation. These items, referred to as **quick assets**, generally consist of cash, temporary investments, accounts receivable, and short-term notes receivable. Inventories are excluded because their salability is uncertain and they frequently are sold on credit; thus they may not be quickly converted into cash. Prepaid items are excluded because they are not convertible into cash. The acid-test ratio highlights potential liquidity problems because of an inadequate mix of current assets. For instance, the use of this ratio usually reveals the lower liquidity of a company having a significant amount of inventories that would not be shown in the current ratio. However, be careful to consider which assets to include. Even though inventories usually are excluded from the acid-test ratio, sometimes these are, in fact, more liquid than certain receivables. A quick ratio of 1.0 used to be a general rule of thumb. Today, as with the current ratio, greater consideration is given to such factors as industry practices and the company's typical operations.

## Activity Ratios

Activity ratios are used to evaluate the liquidity of certain current assets by estimating the length of various segments of a company's operating cycle. The ratios are indicators of the efficiency with which the company uses its short-term economic resources. Example 6-9 shows the three common activity ratios, along with the calculations for the Cooper Company. We discuss each ratio in the following sections.

### EXAMPLE 6-9 Activity Ratios

Ratio	Formula	Calculations (2008)
1. Inventory Turnover	$\frac{\text{Cost of Goods Sold}}{\text{Average Inventory}}$	$\frac{\$74,100}{\frac{\$8,900 + \$10,100}{2}} = 7.8 \text{ times or } 47 \text{ days}^*$
2. Receivables Turnover	$\frac{\text{Net Credit Sales}}{\text{Average Net Receivables}}$	$\frac{\$130,000 \times 0.70}{\frac{\$7,600 + \$8,600}{2}} = 11.2 \text{ times or } 33 \text{ days}^*$
3. Payables Turnover	$\frac{\text{Cost of Goods Sold}}{\text{Average Accounts Payable}}$	$\frac{\$74,100}{\frac{\$5,000 + \$6,600}{2}} = 12.8 \text{ times or } 29 \text{ days}^*$

\*365-day business year.

### Inventory Turnover

A company's operating cycle is the length of time it takes to invest in inventory, make credit sales, and convert the receivables into cash. Dividing a company's cost of goods sold for the accounting period by its average inventory indicates the number of times the inventory is "turned over" or sold during that period. As a general rule, the higher the inventory turnover, (1) the more effective the company is in its operations, (2) the lesser the amount that must be tied up in inventory, and (3) the shorter the operating cycle necessary to replenish cash. A company with a higher inventory turnover is usually more efficient and is also minimizing the chance of having obsolete inventory. A smaller investment in inventory means the company either needs less capital or can invest its capital in other earnings activities. However, *too* high an inventory turnover may indicate lost sales as a result of insufficient inventory on hand.

The inventory turnover often is divided into the number of operating days in a "business" year (365, 300, or 250, depending on the industry) so that the inventory segment of the operating cycle may be shown in days. Be careful in developing the average inventory; seasonal factors can affect this average substantially. Also, when a comparison is made of one company to another, both companies should be using similar inventory costing methods. In periods of rising prices, without an adjustment, no valid comparison of inventory turnovers can be made when one company is using FIFO and another company is using LIFO. This is because the company using LIFO will show a higher cost of goods sold and lower inventory than the FIFO company, even though their operations are similar. Therefore, the amounts for the company using LIFO must be adjusted to FIFO, as we discuss in Chapter 8.

### Receivables Turnover

After a company has sold its inventory on credit, the company collects the receivables to complete its operating cycle. Dividing net credit sales by average net trade receivables

indicates how many times receivables are “turned over” or collected each period. The receivables turnover is an indicator of how efficiently the company collects its receivables and converts them back into cash. As a general rule, the higher the turnover the better, because the company has less cash tied up in receivables, collects this cash at a faster pace, and usually has fewer uncollectible accounts. When net credit sales information is not available, net sales are used in the calculations. Be careful to consider seasonal factors and to exclude nontrade receivables in developing the average receivables.

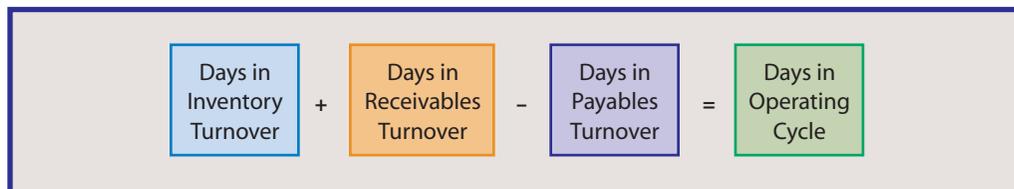

The receivables turnover often is divided into the number of days in the business year to show the average collection period in days. A comparison of a company’s average collection period to the days in its typical credit terms gives an indication of how aggressively the company’s credit department collects overdue accounts.

### Payables Turnover

The payables turnover ratio measures the number of times accounts payable turn over during the year. The higher the turnover, the shorter the time between the purchase of inventory and the cash payment. However, too high a turnover may indicate that the company is making payments too quickly and losing the “free” credit provided by accounts payable. Alternatively, if a company’s payables turn over more slowly than the average for its industry, it may indicate that the company is having financial difficulty. It may be preferable to compute the ratio by using purchases as the numerator. In this case purchases can be computed by adding the ending inventory to the cost of goods sold and subtracting the beginning inventory. The payables turnover ratio also may be divided into the number of days in the business year to show the average payment period in days.

### Days in Operating Cycle

The three turnover ratios may be analyzed together to estimate the total number of days in the company’s operating cycle from the payment of cash to purchase inventory to the collection of cash from sales. This period is computed by adding the number of days in the inventory turnover to the number of days in the receivables turnover and subtracting the number of days in the payables turnover, as we show in the following diagram. For example, in Example 6-9, the Cooper Company’s operating cycle is 51 ( $47 + 33 - 29$ ) days.

### Stability Ratios

Stability ratios are used to evaluate the long-run solvency and stability of a company. They provide evidence of the safety (risk) of the investments in the company by long-term bondholders, preferred stockholders, and common stockholders. Example 6-10 shows several stability ratios, along with the calculations for the Cooper Company. We discuss each ratio in the following sections.

### Debt Ratio

The debt ratio indicates the percentage of total assets contributed by creditors. Subtraction of this ratio from 100% shows the percentage of total assets (or *equity ratio*)

**EXAMPLE 6-10** Stability Ratios

Ratio	Formula	Calculations (2008)
1. Debt Ratio	$\frac{\text{Total Liabilities}}{\text{Total Assets}}$	$\frac{\$36,200}{\$129,200} = 28\%$
2. Interest Coverage	$\frac{\text{Pretax Operating Income}}{\text{Interest Expense}}$	$\frac{\$15,700 + \$3,000}{\$3,000} = 6.2 \text{ times}$
3. Book Value per Common Share	$\frac{\text{Common Stockholders' Equity}}{\text{Outstanding Common Shares}}$	$\frac{\$93,000 - (\$140 \times 150)}{5,400} = \$13.33 \text{ per common share}$

contributed by stockholders.<sup>15</sup> Sometimes, when a company has issued a significant amount of preferred stock (which has some characteristics of both debt and common stock), the equity ratio is further divided into a preferred equity ratio and a common equity ratio. The appropriate relationship (or “mix”) between the debt and equity ratios depends on the industry. In general, creditors prefer to see a lower debt ratio because, in the event of business decline, their interests are better protected and there is less risk. Up to a point, stockholders prefer a higher debt ratio, particularly when the company is favorably “trading on the equity,” or applying favorable “financial leverage.” This occurs when the company borrows money from creditors at an interest rate (net of income taxes) that is lower than the return the company can earn in its operations. However, an extremely high debt ratio is likely to be a disadvantage when a company wants to attract additional external capital. Investors in both long-term bonds and stocks usually consider a highly leveraged company to be a relatively unstable and more risky investment.

### Interest Coverage

The interest coverage ratio (sometimes called the *times interest earned ratio*) is used to evaluate the ability of a company to cover its interest obligations through its annual earnings. It is a measure of the safety of creditors’ (particularly long-term) investments in the company. As a general rule, the higher the interest coverage ratio the better able the company is to meet its interest obligations. While interest obligations are legal commitments, it is also true that continued interest payments are endangered by low earnings over an extended period of time. Because both earnings and interest expense are based on accrual accounting, the interest coverage ratio is slightly inaccurate, since it should include only cash payments for interest and cash receipts from earnings. Such refinements are rarely made to this ratio, however.

The numerator of the interest coverage ratio usually is a form of pretax *operating income*—that is, pretax continuing income to which interest expense is added back. If a company has preferred stock outstanding, a similar calculation may be made to evaluate the safety of preferred dividends. The *preferred dividends coverage ratio* is computed by dividing net income by the annual preferred dividends.

### Book Value per Common Share

The book value per common share shows the net assets per share of stock. It is sometimes erroneously referred to as the liquidation value per share. Although the book value per common share frequently is computed, for several reasons it is not very useful as an indicator of a company’s financial stability. First, most companies are going concerns and a related liquidation value is not important. Second, even if a liquidation value were important, the book value per share is based on assets recorded primarily in terms of

15. Sometimes total liabilities are divided by total stockholders’ equity to determine the *debt/equity* ratio.

historical costs and thus has no relation to the liquidation value per share. Third, the market value per share of a company's common stock is important in evaluating its stability. Since book value is based on historical costs, it also has no direct relation to this market value. However, if the market price of a company's common stock falls below its book value per common share, some investors consider this to be unfavorable.

When the book value per share is computed and the company has both preferred and common stock outstanding, the equity relating to the common stock is determined first. To do so, stockholders' equity is separated into its preferred and common stock components on the basis of the legal claims of each class upon liquidation. Typically, preferred stock is allocated its par value unless the stock's characteristics include a liquidation value, in which case the latter value is used. When preferred dividends are cumulative and in arrears, an appropriate portion of retained earnings is also assigned as preferred stockholders' equity. The residual amount of stockholders' equity then is assigned as common stockholders' equity. The book value per common share is computed by dividing this residual stockholders' equity by the number of common shares outstanding. A book value per share of preferred stock also may be computed based on the preferred stockholders' equity and the number of preferred shares outstanding.

## Cash Flow Ratios

Cash flow ratios assist a user in understanding relationships and trends among a company's cash flows. Example 6-11 summarizes four of these ratios. We do not compute these ratios for the Cooper Company, because they are not as generally accepted and the statement of cash flows is not provided.

### EXAMPLE 6-11 Cash Flow Ratios

Ratio	Formula
1. Cash Flow From Operations to Sales	$\frac{\text{Cash Flow From Operations}}{\text{Sales}}$
2. Cash Flow From Operations to Net Income	$\frac{\text{Cash Flow From Operations}}{\text{Net Income}}$
3. Cash Flow From Operations Per Share	$\frac{\text{Cash Flow From Operations}}{\text{Average Shares of Common Stock Outstanding}}$
4. Cash Flow From Operations to Maturing Debt	$\frac{\text{Cash Flow From Operations}}{\text{Debt Maturing Next Year}}$

### Cash Flow from Operations (CFO) to Sales

This ratio is used to evaluate the cash generated from sales, and the management of cash collections and payments. It enables users to understand the proportion of each sales dollar that is available for investing and financing activities. A comparison of the ratio with the profit margin may be useful. Generally, the CFO to sales ratio is higher than the profit margin, because noncash expenses such as depreciation are deducted in computing net income.

### Cash Flow from Operations to Net Income

This ratio enables users to understand how the earning of net income relates to the receipt of CFO. While many users consider CFO as important as income, be careful because income is computed on the accrual basis, whereas CFO may vary depending on

when cash flows occur. Management may find it easier to influence the timing of cash flows than the measurement of income.

### Cash Flow from Operations per Share

Disclosure of CFO per share is expressly prohibited by GAAP for the reasons we discussed above. However, users may wish to compute it, using the weighted average number of shares that the company discloses for its computation of earnings per share.

### Cash Flow from Operations to Maturing Debt

Since CFO is usually the primary source of cash, this ratio measures the ability of a company to make principal payments. It is an indicator of whether the company has the capacity to borrow additional debt.

Other cash flow ratios include CFO divided by cash operating expenses, total assets, or total liabilities, and CFO divided by the cash flows for investing activities that are needed to maintain the operating capacity of the company.

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

1. **Describe an auditor's report.** In an audit report, the auditor expresses three opinions. The first relates to management's assessment of the company's internal control over its financial reporting. The second relates to whether this internal control was maintained by the company. The third relates to the fairness of the financial statements in accordance with generally accepted accounting principles.
2. **Understand the meaning of an operating segment.** An operating segment is a component of a company that engages in activities to earn revenues and incur expenses, whose operating results are regularly reviewed by the company's chief operating officer, and for which financial information is available.
3. **Describe the disclosures in a segment report.** In a segment report, a company provides general information (e.g., types of products); information about the profit (or loss) and total assets of each reportable segment; reconciliations to the company's total revenues, pretax income from continuing operations, and total assets; and various company-wide information.
4. **Explain interim reporting.** Interim financial statements are financial reports for periods of less than a year. Their purpose is to improve the timeliness of accounting information. In developing an interim report, each interim period is viewed primarily as an integral part of an annual period.
5. **Prepare an interim report.** To prepare an interim report, first a trial balance is prepared on a working paper. Next, year-to-date adjusting entries are recorded on the working paper. Then, the interim financial statements are prepared. In preparing the statements, inventory may have to be estimated, the adjusting entries are not entered into the accounts, and closing entries are not made.
6. **Understand intracompany and intercompany comparisons (Appendix).** Intracompany comparison involves comparing a company's current financial performance and condition to the company's past results. Intercompany comparison involves comparing a company's performance with that of competitors, with the industry as a whole, or with the results in related industries.
7. **Prepare horizontal and vertical percentage analyses (Appendix).** In horizontal analysis, changes in a company's operating results and financial position over time are shown in percentages as well as in dollars. In vertical analysis, the monetary relationships between items on a company's financial statements for a particular period are shown in percentages as well as in dollars.
8. **Perform ratio analysis (Appendix).** A ratio involves dividing one or more items on a company's financial statements by another related item or items. Ratio analysis involves computing ratios to evaluate a company's performance using intracompany and intercompany analysis. The six groups of ratios include (1) stockholder profitability, (2) company profitability, (3) liquidity, (4) activity, (5) stability, and (6) cash flow ratios.

## ANSWERS TO REAL REPORT QUESTIONS

### Real Report 6-1 Answers

1. Internal controls are in place to provide reasonable assurance as to the integrity and reliability of the financial statements. Wachovia also states that it has conducted an evaluation of its internal controls over financial reporting and concluded that the internal controls were effective. This conclusion (assertion) has been audited by Wachovia's auditors.
2. In this context, the concept of reasonable assurance takes into account that one cannot be absolutely sure that the

financial statements are not materially misstated, that assets were improperly used or stolen, or that fraud has not occurred. Reasonable assurance takes into account that mistakes can still occur, differences in judgment may exist, and that controls in place can still be circumvented. Nevertheless, reasonable assurance is still a high level of assurance that most would interpret as a remote likelihood that the internal controls did not prevent or detect material misstatements on a timely basis.

## QUESTIONS

**Q6-1** What does *efficient markets hypothesis* research show and what does an "efficient capital market" mean?

**Q6-2** In an audit report, what three opinions are expressed by the auditor?

**Q6-3** What is an *audit committee*? Generally, what are its duties?

**Q6-4** Why do investors and creditors desire financial information concerning the operating segments of a company?

**Q6-5** Briefly describe the three alternative tests used to determine a "reportable segment."

**Q6-6** Briefly describe the information that a company reports in regard to the profit (or loss) and assets of each reportable segment.

**Q6-7** What company-wide disclosures must a company make related to its operating segments?

**Q6-8** What are *interim financial statements* and why are they issued?

**Q6-9** What specific principles must a company apply to the reporting of inventories in its interim financial reports?

**Q6-10** What principles does a company apply to the accounting for expenses not directly associated with product sales during an interim period?

**Q6-11** Briefly explain how the accounting procedures for preparing a company's interim reports are (a) similar and (b) dissimilar to those used in preparing annual reports.

**Q6-12** List the minimum disclosures that must be made by a publicly held company in its interim financial report.

**Q6-13** List the responsibilities of the Chief Accountant and the Division of Corporation Finance of the SEC.

**Q6-14** What are the two SEC reports that are important to accountants?

**Q6-15 (Appendix)** What two types of comparisons may external users make in their financial decision making? Why is knowledge of these comparisons important to accountants?

**Q6-16 (Appendix)** What is *horizontal analysis* and how is it prepared?

**Q6-17 (Appendix)** What is *vertical analysis* and how does it differ from horizontal analysis?

**Q6-18 (Appendix)** What is *ratio analysis* and how is it used?

**Q6-19 (Appendix)** Briefly describe how each of the stockholder profitability ratios is computed.

**Q6-20 (Appendix)** Briefly describe how each of the company profitability ratios is computed.

**Q6-21 (Appendix)** Which financial ratios may be used to evaluate the effectiveness and efficiency of a company's reportable operating segments?

**Q6-22 (Appendix)** Briefly describe how each of the liquidity ratios is computed.

**Q6-23 (Appendix)** Briefly describe how each of the activity ratios is computed.

**Q6-24 (Appendix)** Briefly describe how each of the stability ratios is computed.

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

**M6-1** The computation of a company's third-quarter provision for income taxes should be based on earnings

- For the quarter at an expected annual effective income tax rate
- For the quarter at the statutory rate
- To date at an expected annual effective income tax rate less prior quarters' provisions
- To date at the statutory rate less prior quarters' provisions

**M6-2** Which of the following ratios measures short-term solvency?

- Current ratio
- Age of receivables
- Creditors' equity to total assets
- Return on investment

**M6-3** Kaycee Corporation's revenues for the current year were as follows:

Consolidated revenue per income statement	\$1,200,000
Intersegment sales	180,000
Intersegment transfers	60,000
Combined revenues of all operating segments	\$1,440,000

Kaycee has a reportable segment if that operating segment's revenues exceed

- \$6,000
- \$24,000
- \$120,000
- \$144,000

**M6-4** An inventory loss from a market decline occurred in the first quarter that was not expected to be restored in the fiscal year. For interim financial reporting purposes, how would the dollar amount of inventory in the balance sheet be affected in the first and fourth quarters?

First Quarter	Fourth Quarter
a. Decrease	No effect
b. Decrease	Increase
c. No effect	Decrease
d. No effect	No effect

**M6-5** Barr Corporation's capital stock at December 31, 2007 consisted of the following:

- Common stock, \$2 par value; 100,000 shares authorized, issued, and outstanding
- 10% noncumulative, nonconvertible preferred stock, \$100 par value; 1,000 shares authorized, issued, and outstanding

Barr's common stock, which is listed on a major stock exchange, was quoted at \$4 per share on December 31, 2007. Barr's net income for the year ended December 31, 2007 was \$50,000. The 2007 preferred dividend was declared. No

capital stock transactions occurred during 2007. What was the price/earnings ratio on Barr's common stock at December 31, 2007?

- 8 to 1
- 10 to 1
- 16 to 1
- 20 to 1

**M6-6** In August 2007, Ella Company spent \$150,000 on an advertising campaign for subscriptions to the magazine it sells on getting ready for the skiing season. There are only two issues: one in October and one in November. The magazine is only sold on a subscription basis and the subscriptions started in October 2007. Assuming Ella's fiscal year ends on March 31, 2008, what amount of expense should be included in Ella's quarterly income statement for the three months ended December 31, 2007 as a result of this expenditure?

- \$37,500
- \$50,000
- \$75,000
- \$150,000

**M6-7** When a company reports the profit (or loss) for a reportable operating segment, it also must disclose the segment's

- Revenues
- Interest revenue and interest expense
- Depreciation, depletion, and amortization expense
- All of the above

**M6-8** Utica Company's net accounts receivable were \$250,000 at December 31, 2006 and \$300,000 at December 31, 2007. Net cash sales for 2007 were \$100,000. The accounts receivable turnover for 2007 was 5.0. What were Utica's total net sales for 2007?

- \$1,475,000
- \$1,500,000
- \$1,600,000
- \$2,750,000

**M6-9** During 2007, Red, Incorporated purchased \$2,000,000 of inventory. The cost of goods sold for 2007 was \$2,200,000, and the ending inventory at December 31, 2007 was \$400,000. What was the inventory turnover for 2007?

- 4.0
- 4.4
- 5.5
- 11.0

**M6-10** The following data pertain to Cowl, Inc. for the year ended December 31, 2007:

Net sales	\$ 600,000
Net income	150,000
Total assets, January 1, 2007	2,000,000
Total assets, December 31, 2007	3,000,000

What was Cowl's rate of return on assets for 2007?

- 5%
- 6%
- 20%
- 24%

## EXERCISES

**E6-1 Segment Reporting** York Drug Company has two reportable operating segments, A and B. The 2007 condensed income statement for the entire company is as follows:

Sales	\$90,000
Cost of goods sold	<u>(50,000)</u>
Gross profit	\$40,000
Operating expenses	<u>(18,000)</u>
Income before income taxes	\$22,000
Income tax expense	<u>(8,800)</u>
Net Income	<u><u>\$13,200</u></u>

*Additional Information:*

1. Sales are made as follows: Segment A, \$52,000; Segment B, \$26,000; other segments, \$12,000 of the total.
2. Cost of goods sold for each segment is as follows: Segment A, \$30,000; Segment B, \$12,500; other segments, \$7,500.
3. Operating expenses are identified with the segments as follows: Segment A, \$10,000; Segment B, \$4,500; other segments, \$3,500. There are no general corporate expenses.
4. The company has \$110,000 total assets as of December 31, 2007. These assets are assigned to the segments as follows: Segment A, \$49,500; Segment B, \$38,500; other segments, \$22,000. There are no general corporate assets.

**Required**

Prepare a schedule that reports on the 2007 revenues, profit, and assets of Segments A and B and the other segments of the York Drug Company.

**E6-2 Segment Reporting** The Wilson Diversified Company has total assets of \$130,000 at the end of 2007 and the following condensed income statement for 2007:

Sales	\$90,000
Operating expenses	<u>(66,600)</u>
Income before income taxes	\$23,400
Income tax expense	<u>(7,020)</u>
Net income	<u><u>\$16,380</u></u>

The company has two reportable operating segments and has developed the following related information:

	Segments			Total
	1	2	Other	
Sales	\$51,700	\$24,400	\$13,900	\$ 90,000
Operating expenses	36,780	15,400	10,420	66,600 <sup>a</sup>
Segment assets	70,300	28,740	21,960	130,000 <sup>b</sup>

- a. Of the \$66,600 total operating expenses, \$4,000 are general corporate expenses.
- b. Of the \$130,000 total assets, \$9,000 are general corporate assets.

**Required**

Prepare a schedule that reports on the revenues, profit, and assets of Segments 1 and 2 and the other operating segments of the Wilson Diversified Company for 2007. Be sure to include the appropriate reconciliations.

**E6-3 Segment Reporting** Parks Conglomerate Company does business in several different industries. The following is a 2007 condensed income statement for the entire company:

Sales	\$300,000
Less:	
Cost of goods sold	\$140,000
Depreciation expense	30,000
Other operating expenses	<u>60,000</u>
Total expenses	<u>(230,000)</u>
Pretax income	\$ 70,000
Income tax expense	<u>(21,000)</u>
Net income	<u><u>\$ 49,000</u></u>

Earnings per share (20,000 shares)	<u><u>\$2.45</u></u>
------------------------------------	----------------------

Parks has two major operating segments, A and B. No other operating segment contributes 10% or more of the company's activities. Segments A and B make no sales to each other or to the other segments of the company. An analysis reveals that \$2,000 of the total depreciation expense and \$6,000 of the total other operating expenses are related to general corporate activities. The *remaining* expenses and total revenues are directly allocable to segment activities according to the following percentages:

	Percent Identified with		
	Segment A	Segment B	Other Segments
Sales	40%	46%	14%
Cost of goods sold	35	50	15
Depreciation expense	40	45	15
Other operating expenses	42	40	18

#### Required

Prepare a schedule that reports on the revenues and profit of Segments A and B and the other operating segments of the Parks Conglomerate Company for 2007. Be sure to reconcile these amounts with the related totals on the preceding income statement. Include notes summarizing the depreciation related to each operating segment and the computation of segment profits.

**E6-4 Determination of Reportable Segments** Straub Diversified Company has five different operating segments. None of these segments makes sales to the other segments. The company has total assets of \$155,000 at the end of 2007 and lists the following condensed income statement for 2007:

Sales	\$100,000
Operating expenses	(72,000)
Pretax income	\$ 28,000
Income taxes	(8,400)
Net income	\$ 19,600

In preparing its segmental reporting schedule, the company determined that it has \$7,000 of general corporate expenses and \$10,000 of general corporate assets. It also developed the following information for each of its five segments:

	Segment				
	1	2	3	4	5
Sales	\$ 9,200	\$ 8,800	\$ 9,000	\$63,900	\$ 9,100
Segment profit	3,300	3,200	3,400	21,500	3,600
Segment assets	15,100	13,900	14,300	87,900	13,800

#### Required

On the basis of the preceding information:

- Determine which segments are reportable operating segments (justify your conclusions).
- Prepare a schedule that reports on the revenues, profit, and assets of the reportable operating segments and the remaining segments of the Straub Diversified Company for 2007. Reconcile these amounts to the related totals on the income statement and to total assets. Notes to the schedule are not necessary.

**E6-5 Interim Reporting** Jersey Company is in the process of developing its first-quarter interim report. It has developed the following condensed trial balance as of March 31, 2007:

	Debit	Credit
Cash	\$ 900	
Accounts receivable (net)	4,000	
Inventory	8,500	
Prepaid insurance	4,800	
Note receivable	6,000	
Land	3,000	
Buildings and equipment (net)	36,000	
Accounts payable		\$ 9,100
Common stock, \$1 par		6,000
Premium on common stock		12,400
Retained earnings (1/1/07)		23,080
Sales (net)		50,000

(continued)

	Debit	Credit
Cost of goods sold	26,500	
Selling expenses	6,500	
General and administrative expenses	4,380	
	<u>\$100,580</u>	<u>\$100,580</u>

*Additional information:*

1. The company makes formal adjusting entries at year-end and enters the amounts in the appropriate accounts at that time.
2. The company uses control accounts for selling expenses and for general and administrative expenses.
3. Uncollectible accounts typically average 1% of net sales.
4. On January 1, 2007, buildings and equipment (net) have an average remaining life of 10 years. One-third of the account balance consists of assets related to selling activities. The company uses straight-line depreciation with no residual value.
5. The note receivable is dated January 1, 2007, matures on January 1, 2009, and carries an annual interest rate of 12% (interest will not be collected until the maturity date).
6. On January 1, 2007, the company had purchased a 3-year insurance policy, debiting Prepaid Insurance for the \$4,800 payment.
7. The company expects its annual effective income tax rate to be 30%. Income taxes for 2007 will be paid at the beginning of 2008.
8. No common stock has been issued or retired in 2007.

**Required** 

On the basis of the preceding information, prepare the Jersey Company income statement for the first quarter of 2007 and a March 31, 2007 balance sheet. A worksheet is not required, but you should be prepared to document any adjustments you make to the preceding accounts.

**E6-6 Interim Reporting** The Howard Corporation presented the following trial balance for the quarter ended March 31, 2007:

	Debit	Credit
Cash	\$ 9,800	
Accounts receivable	13,000	
Inventory (1/1/07)	10,000	
Prepaid insurance	9,600	
Land	16,000	
Buildings and equipment	108,000	
Accumulated depreciation		\$ 36,000
Accounts payable		28,200
Common stock, \$1 par		13,200
Additional paid-in capital		24,800
Retained earnings (1/1/07)		44,900
Sales (net)		100,000
Purchases (net)	59,000	
Selling expenses	12,000	
General and administrative expenses	9,700	
Totals	<u>\$247,100</u>	<u>\$247,100</u>

*Additional information:*

1. The company uses control accounts for selling expenses and for general and administrative expenses.
2. The company makes formal adjusting entries at year-end and enters the amounts in the appropriate accounts at that time.
3. The company uses a periodic inventory system. It uses the gross profit method to determine interim inventory. Historical gross profit has averaged 43% of net sales.
4. On January 1, 2007, the company purchased a 4-year insurance policy for \$9,600.
5. No common stock has been issued or retired in 2007.
6. The buildings and equipment have an estimated life of 15 years with no residual value. The company uses straight-line depreciation; it records one-fourth of the depreciation as a selling expense and the remainder as a general and administrative expense.
7. The company expects its annual effective income tax rate to be 30%; income taxes will be paid at the beginning of the next year.

**Required**

On the basis of the preceding information, prepare the Howard Corporation income statement for the first quarter of 2007 and a March 31, 2007 balance sheet. A worksheet is not required, but you should be prepared to substantiate any adjustments you make to the preceding accounts.

**E6-7 Interim Reporting** The Hill Company prepares quarterly and year-to-date interim reports. The following is its interim income statement for the quarter ended March 31, 2007:

Sales (net)		\$150,000
Cost of goods sold		<u>(90,000)</u>
Gross profit		\$ 60,000
Operating expenses		
Selling expenses	\$18,000	
General expenses	10,600	
Depreciation expense	<u>8,000</u>	<u>(36,600)</u>
Pretax operating income		\$ 23,400
Other items		
Dividend revenue	\$ 600	
Interest expense	<u>(1,000)</u>	<u>(400)</u>
Income before income taxes		\$ 23,000
Income tax expense		<u>(7,000)</u>
Net income		<u>\$ 16,000</u>
Earnings per share (20,000 shares)		<u>\$.80</u>

On June 30, 2007, the company accountant completed a worksheet in preparation for developing the year-to-date interim income statement. The following are the accounts and amounts listed in the income statement debit and credit columns of this worksheet:

	Debit	Credit
Sales (net)		\$340,000
Interest revenue		500
Dividend revenue		1,000
Cost of goods sold	\$190,000	
Selling expenses	50,000	
General expenses	20,000	
Depreciation expense	16,000	
Interest expense	2,100	
Income tax expense	19,200	

**Required**

Based on the given information, and assuming 20,000 shares of common stock have been outstanding for the entire 6 months, for the Hill Company prepare:

1. A year-to-date interim income statement for the first 6 months of 2007.
2. An interim income statement for the second quarter of 2007.

**E6-8 Interim Taxes** Farris Company is subject to income taxes at a rate of 20% on its first \$50,000 of income and 35% on any income in excess of \$50,000. In the process of preparing its interim reports, each quarter Farris Company uses an estimated effective income tax rate based on its estimated annual income. The following is a schedule that shows the company's actual year-to-date pretax income and the estimate of the annual pretax income made at the end of each quarter. The company neither anticipates nor incurs any extraordinary items, and its pretax accounting income is the same as its taxable income.

	Pretax Income Amounts at End of			
	First Quarter	Second Quarter	Third Quarter	Fourth Quarter
Actual income (year-to-date)	\$20,000	\$42,000	\$60,000	\$82,000
Estimated remaining income	<u>60,000</u>	<u>44,000</u>	<u>21,000</u>	<u>—</u>
Estimated annual pretax income	<u>\$80,000</u>	<u>\$86,000</u>	<u>\$81,000</u>	<u>\$82,000</u>

**Required** 

Based on the preceding information, prepare a schedule for Farris Company to compute the income tax expense that would be listed on *each* quarterly income statement. (Carry your effective income tax rate computation to three decimal places.)

**E6-9 Horizontal Analyses (Appendix)** Slusher Company presents the following condensed comparative income statements for 2006, 2007, and 2008:

	<u>For Years Ended December 31,</u>		
	2008	2007	2006
Sales (net)	\$ 120,000	\$ 100,000	\$ 85,000
Cost of goods sold	<u>(72,000)</u>	<u>(55,000)</u>	<u>(45,000)</u>
Gross profit	\$ 48,000	\$ 45,000	\$ 40,000
Operating expenses	<u>(22,000)</u>	<u>(20,000)</u>	<u>(18,000)</u>
Operating income	\$ 26,000	\$ 25,000	\$ 22,000
Other items			
Dividend revenue	400	500	200
Interest expense	<u>(1,200)</u>	<u>(1,000)</u>	<u>(500)</u>
Income before income taxes	\$ 25,200	\$ 24,500	\$ 21,700
Income tax expense	<u>(8,200)</u>	<u>(8,000)</u>	<u>(6,000)</u>
Net income	<u>\$ 17,000</u>	<u>\$ 16,500</u>	<u>\$ 15,700</u>
Number of common shares	6,000	6,000	5,000
Earnings per share	<u>\$2.83</u>	<u>\$2.75</u>	<u>\$3.14</u>

**Required**

Based on the preceding information for Slusher Company, prepare horizontal analyses for the years 2006, 2007, and 2008 using (1) a year-to-year approach and (2) a base-year-to-date approach. Do your analyses reveal any favorable or unfavorable trends?

**E6-10 Vertical Analyses (Appendix)** The Samuels Company presents the following condensed income statement and balance sheet information for 2007 and 2008.

**Income Statements**

	<u>For Years Ended December 31,</u>	
	2008	2007
Sales (net)	\$ 100,000	\$ 90,000
Cost of goods sold	<u>(60,000)</u>	<u>(51,000)</u>
Gross profit	\$ 40,000	\$ 39,000
Operating expenses	<u>(21,300)</u>	<u>(21,900)</u>
Interest revenue	1,500	1,400
Interest expense	<u>(3,700)</u>	<u>(2,500)</u>
Income before income taxes	\$ 16,500	\$ 16,000
Income tax expense	<u>(5,000)</u>	<u>(4,700)</u>
Net income	<u>\$ 11,500</u>	<u>\$ 11,300</u>
Earnings per share	<u>\$1.92</u>	<u>\$1.95</u>

**Balance Sheets**

	<u>December 31,</u>	
	2008	2007
Cash	\$ 3,000	\$ 2,000
Receivables (net)	7,000	8,000
Inventories	11,000	12,000
Long-term investments (bonds)	20,000	15,000
Property and equipment (net)	<u>79,000</u>	<u>63,000</u>
Total Assets	<u>\$120,000</u>	<u>\$100,000</u>

	2008	2007
Current liabilities	\$ 10,000	\$ 11,400
Bonds payable, 10%	37,000	25,000
Common stock, \$2 par	12,000	11,600
Premium on common stock	21,000	19,500
Retained earnings	<u>40,000</u>	<u>32,500</u>
Total Liabilities and Stockholders' Equity	<u>\$120,000</u>	<u>\$100,000</u>

**Required**

Based on the preceding information for Samuels Company, prepare vertical analyses of the income statements and balance sheets for 2008 and 2007. Do your analyses reveal any trends in the company's operations and financial position?

**E6-11 Ratios (Appendix)** The following are a condensed income statement for 2007 and a December 31, 2007 balance sheet for the Allen Company:

Income Statement	
Sales (net)	\$304,400
Cost of goods sold	<u>(183,600)</u>
Gross profit	\$120,800
Operating expenses	(82,000)
Interest expense	<u>(7,000)</u>
Income before income taxes	\$ 31,800
Income taxes	<u>(10,000)</u>
Net income	<u>\$ 21,800</u>

Balance Sheet			
Cash	\$ 8,200	Accounts payable	\$ 18,000
Receivables (net)	14,700	Other current liabilities	6,800
Inventory	19,300	Bonds payable, 10%	70,000
Property, plant, and equipment (net)	<u>195,800</u>	Common stock, \$10 par	80,500
		Premium on common stock	24,000
		Retained earnings	<u>38,700</u>
Total Assets	<u>\$238,000</u>	Total Liabilities and Stockholders' Equity	<u>\$238,000</u>

*Additional information:* The corporate common stock was outstanding the entire year and is selling for \$16 per share at year-end. On January 1, 2007, the inventory was \$21,500, the total assets were \$224,000, the accounts payable were \$18,800, and the total stockholders' equity was \$130,800. The company operates on a 300-day business year.

**Required** 

For the Allen Company, compute the following ratios:

- Price/earnings
- Profit margin
- Return on total assets
- Return on stockholders' equity
- Current
- Inventory turnover (in days)
- Payables turnover (in days)
- Debt

Is the company favorably "trading on its equity"? Explain.

**E6-12 Ratios (Appendix)** The Byers Company presents the following condensed income statement for 2007 and condensed December 31, 2007 balance sheet:

Income Statement	
Sales (net)	\$267,000
Less:	
Cost of goods sold	\$160,000
Operating expenses	62,000
Interest expense	11,000
Income taxes	<u>10,000</u>
Total expenses	<u>(243,000)</u>
Net income	<u>\$ 24,000</u>

## Balance Sheet

Cash	\$ 10,000	Current liabilities	\$ 40,000
Receivables (net)	22,000	Bonds payable, 10%	110,000
Inventory	56,000	Preferred stock, \$100 par	50,000
Long-term investments	30,000	Common stock, \$10 par	100,000
Property and equipment (net)	<u>282,000</u>	Additional paid-in capital	45,000
		Retained earnings	<u>55,000</u>
Total Assets	<u>\$400,000</u>	Total Liabilities and Stockholders' Equity	<u>\$400,000</u>

## Additional information:

- The company's common stock and preferred stock were outstanding the entire year.
- Dividends of \$1.50 per share on the common stock and \$6 per share on the preferred stock were declared in 2007.
- On December 31, 2007, the common stock is selling for \$20 per share.
- The preferred stock has a liquidation value of \$110 per share.
- On January 1, 2007, the accounts receivable (net) balance was \$24,000 and the total stockholders' equity was \$246,000.
- Of the company's net sales, 78% are on credit.
- The company operates on a 365-day business year.

## Required

On the basis of the preceding information, compute the following ratios for the Byers Company:

- Earnings per share
- Dividend yield
- Return on stockholders' equity
- Current
- Acid-test
- Receivables turnover (in days)
- Interest coverage
- Book value per common share

On the basis of applicable "rules of thumb," what information is revealed by the acid-test ratio that is not disclosed by the current ratio?

**E6-13 AICPA Adapted Ratios (Appendix)** Daley, Inc. is consistently profitable. Daley's normal financial statement relationships are as follows:

- Current ratio: 3 to 1
- Inventory turnover: 4 times
- Total debt/total assets ratio: 0.5 to 1

In 2007, Daley was involved in the following transactions and events:

- Daley issued a stock dividend.
- Daley declared, but did not pay, a cash dividend.
- Customers returned invoiced goods for which they had not paid.
- Accounts payable were paid on December 31, 2007.
- Daley recorded both a receivable from its insurance company and a loss from fire damage to a factory building.
- Early in 2007, Daley increased the selling price of one of its products that had a demand in excess of capacity. The number of units sold in 2006 and 2007 was the same.

## Required

For items 1 through 6, determine whether each 2007 transaction or event increased (I), decreased (D), or had no effect (N) on each of the 2007 ratios.

## PROBLEMS

**P6-1 Income Statement and Segment Reporting** Frahm Corporation presents the following account balances, after adjustments, on December 31, 2007:

Administrative and office salaries	\$ 43,000	Sales salaries and commissions	\$ 59,000
Interest expense	8,800	Property taxes	7,000
Bad debts expense	6,000	Depreciation expense: buildings,	
Sales (net)	600,000	sales equipment, and office equipment	31,000
Loss due to tornado (pretax)	12,000	Cost of goods sold	323,700
Advertising expense	40,000	Delivery expense	25,000
Miscellaneous office expenses	2,300	Interest revenue	3,000

The following information is also available:

- The income tax rate on all items is 30%.
- 10,000 shares of common stock have been outstanding the entire year.
- Frahm Corporation operates several divisions, two of which, Divisions B and C, are considered reportable operating segments.
- Sales (net) are made as follows: Division B, 60%; Division C, 25%; other divisions, 15% of the total. No intersegment sales are made.
- The cost of goods sold as a *percentage of net sales* in each division is as follows: Division B, 55%; Division C, 52%; other divisions, 53%.
- Operating expenses are traceable to divisions as follows:
  - Sales salaries directly traceable to Division B total \$27,000; Division C, \$12,000; other divisions, \$8,000.
  - Sales commissions in each division are 2% of net sales.
  - Bad debts average 1% of net sales in each division.
  - Of the total delivery expense, 64% was spent in Division B, 20% was spent in Division C, and 16% was spent in the other divisions.
  - Of the total advertising expense, \$5,000 was spent on general advertising. Of the remainder, 52% was spent in Division B, 28% in Division C, and 20% in the other divisions.
  - Administrative and office salaries are considered general corporate expenses, except for \$17,000 allocated for the management of Division B, \$12,000 for the management of Division C, and \$10,000 for the management of the other divisions.
  - Property taxes paid are \$4,000 in Division B, \$2,000 in Division C, and \$1,000 in other divisions.
  - Miscellaneous office expenses are not directly traced to divisions.
- The depreciation expense is listed as a separate component on the corporate income statement. Of the total listed, \$6,000 is due to depreciation on the corporate headquarters building and is not allocated. Of the remainder, \$15,000 is traceable to Division B, \$6,000 is traceable to Division C, and \$4,000 is traceable to the other divisions.
- Interest expense is for corporate bonds used to finance overall operating activities. Interest revenue is from corporate investments in marketable securities.
- An infrequent and unusual tornado caused a warehouse used in Division B to be severely damaged, resulting in the material pretax loss shown earlier.
- Of the \$1,600,000 total company assets at year-end, \$910,000 are assets of Division B, \$420,000 are assets of Division C, \$140,000 are assets of the remaining divisions, and \$130,000 are assets related to corporate headquarters.
- Capital expenditures of Divisions B and C amounted to \$50,000 and \$27,000, respectively, in 2007 and are included in the total company assets at year-end.

#### Required

- Prepare a single-step 2007 income statement for the Frahm Corporation.
- Prepare a separate schedule that shows the revenues, profit, and assets of Divisions B and C and the remaining operating divisions.
- Prepare appropriate segment notes relating to depreciation, profits, and capital expenditures.
- (Appendix) Compute the profit margin *before* income taxes for Divisions B and C, and for the other divisions. What do these ratios reveal?

**P6-2** *Income Statement and Segment Reporting* The following accounts are taken from the December 31, 2007 adjusted trial balance of the Reed Company:

Cost of goods sold	\$121,120	Loss due to flood (pretax)	\$ 8,000
Interest expense	4,880	Sales (net)	200,000
Depreciation expense	7,000	Administrative expenses	16,000
Selling expenses	26,000	Interest revenue	1,000

#### Additional information:

- The company had 5,000 shares of common stock outstanding the entire year.
- The income tax rate is 30% on all items.
- The Reed Company operates several divisions, two of which, Divisions 1 and 2, are reportable operating segments.
- No intersegment sales are made by any division. Of the total sales (net), Division 1 made 49%; Division 2, 30%; and the remaining segments, 21%.
- Cost of goods sold as a *percentage of net sales* in each division was: Division 1, 62%; Division 2, 60%; other segments, 58%.
- Selling expenses consist of sales salaries, sales commissions, delivery costs, advertising, and miscellaneous expenses. These are traceable to the segments as follows:
  - Sales salaries (\$6,000): \$3,000 to Division 1, \$2,000 to Division 2, and \$1,000 to the remaining segments.
  - Sales commissions (\$4,000): 2% of net sales in all segments.

- c. Delivery costs (\$5,000): 60% to Division 1, 30% to Division 2, and 10% to the remaining segments.
  - d. Advertising (\$10,500): Of the total, \$1,200 was spent on general advertising. The remainder was spent as follows: \$4,600 in Division 1, \$3,200 in Division 2, and \$1,500 in the other segments.
  - e. The miscellaneous selling expenses of \$500 are considered common costs and are not allocated to any segments.
7. Administrative expenses consist of bad debts, administrative salaries, property taxes, and miscellaneous expenses. These are allocable to the segments as follows:
    - a. Bad debts (\$2,000): 1% of net sales in all segments.
    - b. Administrative salaries (\$10,000): Of the total, \$2,100 are considered general corporate salaries. The remainder is allocated \$3,800 to Division 1, \$2,500 to Division 2, and \$1,600 to the other segments.
    - c. Property taxes (\$3,000): Of the total, \$1,600 are general corporate expenses. Of the remainder, 40% is allocable to Division 1, 35% to Division 2, and 25% to the remaining segments.
    - d. The miscellaneous administrative expenses of \$1,000 are considered common costs and are not allocated to any segments.
  8. Depreciation expense is listed as a separate item on the income statement. Of the total, \$1,400 is a general corporate expense. Of the remainder, 40% is allocable to Division 1, 30% to Division 2, and 30% to the remaining segments.
  9. Interest revenue is from corporate investments in marketable securities. Interest expense is related to corporate bonds used to finance general operating activities.
  10. An unusual and infrequent flood causing the material pretax loss occurred in Division 1.
  11. Of the \$300,000 total assets on December 31, 2007, 45% are assets of Division 1, 29% are assets of Division 2, 18% are assets of the remaining segments, and 8% are assets related to corporate headquarters.
  12. Capital expenditures amounted to \$25,000 in Division 1 and \$6,000 in Division 2 during 2007 and are included in the total assets on December 31, 2007.

#### Required

1. Prepare a 2007 multiple-step income statement for the Reed Company.
2. Prepare a separate schedule that discloses the revenues, profit, and assets of Divisions 1 and 2, and the remaining operating segments.
3. Prepare appropriate segment notes related to depreciation, profit, and capital expenditures.
4. (*Appendix*) Compute the *pretax* return on identifiable assets for Divisions 1 and 2, and for the other divisions. What do these ratios reveal?

**P6-3 Interim Reporting** The Schultz Company prepares interim financial statements at the end of each quarter. The income statement presented at the end of the first quarter of 2007 is as follows:

Sales (net)	\$40,000	
Cost of goods sold	<u>(23,000)</u>	
Gross profit	\$17,000	
Operating expenses:		
Selling expenses	\$8,800	
Administrative expenses	<u>4,210</u>	
Total operating expenses	<u>(13,010)</u>	
Pretax operating income	\$ 3,990	
Other items:		
Interest revenue	\$ 40	
Rent revenue	300	
Interest expense	<u>(330)</u>	<u>10</u>
Income before income taxes	\$ 4,000	
Income tax expense	<u>(700)</u>	
Net income	<u>\$ 3,300</u>	
Earnings per share (8,000 shares)	<u>\$ .41</u>	

Shown next is the Schultz Company trial balance as of June 30, 2007:

	Debit	Credit
Cash	\$ 7,200	
Accounts receivable (net)	10,300	
Note receivable (due 9/1/07)	4,000	
Inventory	24,400	
Prepaid insurance	960	
Property and equipment	80,000	

	Debit	Credit
Accumulated depreciation		\$ 20,000
Accounts payable		8,000
Dividends payable		3,200
Unearned rent		1,800
Bonds payable, 10% (due 1/1/2012)		12,000
Discount on bonds payable	600	
Common stock, \$1 par		8,000
Premium on common stock		34,580
Retained earnings		26,400
Sales (net)		90,000
Cost of goods sold	48,600	
Selling expenses	19,750	
Administrative expenses	8,170	
	<u>\$203,980</u>	<u>\$203,980</u>

*Additional information:*

- The company uses a perpetual inventory system.
- The company uses control accounts for selling and administrative expenses.
- The company journalizes and posts its adjusting entries to its accounts *only at year-end*.
- Uncollectible accounts average 0.5% of net sales.
- The \$4,000 note receivable was received on March 1, 2007. The 6-month note carries an annual interest rate of 12%, the interest to be collected at the maturity date.
- The balance in the Prepaid Insurance account represents payment made on January 1, 2007 for a one-year comprehensive insurance policy.
- The Property and Equipment account consists of land, \$5,000; buildings, \$55,000; and equipment, \$20,000. The buildings are being depreciated over a 25-year life; the equipment over an 8-year life. Straight-line depreciation is used; residual value is disregarded. No acquisitions have been made in 2007. The depreciation on the buildings is treated as an administrative expense; depreciation on the equipment as a selling expense.
- On February 1, 2007, the company rented some floor space to another company, receiving one year's rent of \$1,800 in advance.
- The bonds pay interest semiannually on January 1 and July 1. Straight-line amortization of the discount is recorded at the end of each year.
- The company estimates that its pretax income for the second half of 2007 will total \$11,550. All items in income are subject to the same income tax rate schedule. The income tax rate schedule is 15% on the first \$20,000 of taxable income and 30% on the excess. There is no difference between the company's pretax financial income and taxable income, and no tax credits are available. The company rounds its estimated effective income tax rate to the nearest tenth of a percent. Income taxes will be paid during the first quarter of 2008.
- On June 29, 2007, the company had declared and recorded (directly in Retained Earnings) a semiannual dividend of 40¢ per share, payable on August 3, 2007.
- The 8,000 shares of common stock have been outstanding the entire 6 months of 2007.

**Required** 

- Prepare a 10-column worksheet to develop the Schultz Company financial statements for the first 6 months of 2007 (refer to Chapter 3 for a worksheet illustration, if necessary).
- Prepare the income statement for (a) the first 6 months of 2007 and (b) the second quarter of 2007.
- Prepare a retained earnings statement for the first 6 months of 2007.
- Prepare the June 30, 2007 balance sheet.

**P6-4 Interim Reporting** The Sikyta Company prepares quarterly and year-to-date financial statements at the end of each quarter. The income statement presented at the end of the first quarter of 2007 is:

Sales (net)	\$62,000
Cost of goods sold	<u>(37,200)</u>
Gross profit	\$24,800
Operating expenses	<u>(14,074)</u>
Pretax operating income	\$10,726

Other items	
Interest expense (bonds)	<u>(726)</u>
Income before income taxes	\$10,000
Income tax expense	<u>(2,000)</u>
Net income	<u>\$ 8,000</u>
Earnings per share (10,000 shares)	<u>\$ .80</u>

The following is the Sikyta Company trial balance as of June 30, 2007:

	Debit	Credit
Cash	\$ 10,200	
Accounts receivable	14,700	
Allowance for doubtful accounts		\$ 400
Note receivable (due April 2, 2008)	5,000	
Inventory	29,500	
Prepaid rent (warehouse)	2,400	
Land	12,000	
Buildings	80,000	
Equipment	18,000	
Accumulated depreciation: buildings and equipment		23,000
Accounts payable		9,100
Dividends payable		3,000
Note payable (due October 1, 2007)		6,000
Bonds payable, 12% (due January 1, 2017)		25,000
Premium on bonds payable		960
Common stock, \$0.50 par		5,000
Additional paid-in capital		52,000
Retained earnings		22,968
Sales (net)		120,000
Cost of goods sold	71,420	
Operating expenses	<u>24,208</u>	
	<u>\$267,428</u>	<u>\$267,428</u>

*Additional information:*

- The company uses a perpetual inventory system.
- The company uses a control account for operating expenses.
- Bad debts average 0.5% of net sales.
- The company journalizes and posts adjusting entries only at the end of the year.
- On March 1, 2007, the company rented a small warehouse, paying a year's rent of \$2,400 in advance.
- The note receivable was received from a customer on April 1, 2007. The customer will pay the note plus interest of 14% on April 1, 2008.
- The buildings are being depreciated over a 25-year life, the equipment over a 10-year life. No acquisitions have been made in 2007. The company uses straight-line depreciation. Residual value is expected to be nominal and is not considered for depreciation.
- The note payable was issued on April 1, 2007. It carries an annual interest rate of 13%; interest is payable on the maturity date.
- The bonds pay interest semiannually on January 1 and July 1. Straight-line amortization of the premium is recorded at the end of each year.
- At the end of the second quarter, it estimated that the pretax income for the remaining 6 months would total \$20,000. The income tax rate schedule is 15% on the first \$20,000 of taxable income and 30% on the excess. The company rounds its estimated effective income tax rate to the nearest tenth of a percent. There is no difference between the company's pretax financial income and taxable income. Income taxes will be paid during the first quarter of 2008.
- The company declared and recorded (directly in Retained Earnings) a 30¢ per share semiannual dividend (on 10,000 shares) on June 30, 2007, payable on July 31, 2007.
- The 10,000 shares of common stock have been outstanding the entire 6 months of 2007.

**Required**

1. Prepare a 10-column worksheet to develop the Sikyta Company financial statements for the first 6 months of 2007 (refer to Chapter 3 for a worksheet illustration, if necessary).
2. Prepare the income statement for (a) the first 6 months of 2007 and (b) the second quarter of 2007.
3. Prepare a retained earnings statement for the first 6 months of 2007.
4. Prepare the June 30, 2007 balance sheet.

**P6-5 AICPA Adapted Interim Reporting** The Anderson Manufacturing Company, a California corporation listed on the Pacific Coast Stock Exchange, budgeted activities for 2007 as follows:

	Amount	Units
Net sales	\$6,000,000	1,000,000
Cost of goods sold	<u>(3,600,000)</u>	1,000,000
Gross margin	\$2,400,000	
Selling, general, and administrative expenses	<u>(1,400,000)</u>	
Operating earnings	\$1,000,000	
Nonoperating revenues and expenses	<u>0</u>	
Earnings before income taxes	\$1,000,000	
Estimated income taxes (current and deferred)	<u>(350,000)</u>	
Net earnings	<u>\$ 650,000</u>	
Earnings per share	<u>\$6.50</u>	

Anderson has operated profitably for many years and has experienced a seasonal pattern of sales volume and production similar to the following forecasted for 2007. Sales volume is expected to follow a quarterly pattern of 10%, 20%, 35%, and 35%, respectively, because of the seasonality of the industry. Also, due to production and storage capacity limitations, it is expected that production will follow a pattern of 20%, 25%, 30%, and 25%, respectively.

At the conclusion of the first quarter of 2007, the controller of Anderson has prepared and issued the following interim report for public release:

	Amount	Units
Net sales	\$ 600,000	100,000
Cost of goods sold	<u>(360,000)</u>	100,000
Gross margin	\$ 240,000	
Selling, general, and administrative expenses	<u>(275,000)</u>	
Operating loss	\$ (35,000)	
Loss from warehouse fire	<u>(175,000)</u>	
Loss before income taxes	\$(210,000)	
Estimated income taxes	<u>0</u>	
Net loss	<u>\$(210,000)</u>	
Loss per share of common stock	<u>\$(2.10)</u>	

The following additional information is available for the first quarter just completed, but was not included in the public information released:

1. The company uses a standard cost system in which standards are set at currently attainable levels on an annual basis. At the end of the first quarter, there was underapplied fixed factory overhead (volume variance) of \$50,000 that was treated as an asset at the end of the quarter. Production during the quarter was 200,000 units, of which 100,000 were sold.
2. The selling, general, and administrative expenses were budgeted on a basis of \$900,000 fixed expenses for the year plus \$0.50 variable expenses per unit of sales.
3. Assume that the warehouse fire loss met the conditions of an extraordinary loss. The warehouse had an undepreciated cost of \$320,000; \$145,000 was recovered from insurance on the warehouse. No other gains or losses are anticipated this year from similar events or transactions, nor has Anderson had any similar losses in preceding years; thus, the full loss will be deductible as an ordinary loss for income tax purposes.
4. The effective income tax rate, for federal and state taxes combined, is expected to average 35% of earnings before income taxes during 2007. There are no permanent differences between pretax financial income and taxable income.
5. Earnings per share were computed on the basis of 100,000 shares of capital stock outstanding. Anderson has only one class of stock issued, no long-term debt outstanding, and no stock option plan.

**Required**

1. Without reference to the specific situation described previously, what are the standards of disclosure for interim financial data (published interim financial reports) for publicly traded companies? Explain.

- Identify the weaknesses in form and content of Anderson's interim report without reference to the additional information.
- For each of the five items of additional information, indicate the preferable treatment for each item for interim reporting purposes and explain why that treatment is preferable.

**P6-6 AICPA Adapted** *Financial Statement Presentation and Ratios* The Horizon Company is listed on the New York Stock Exchange. The market value of its common stock was quoted at \$18 per share at both December 31, 2007 and December 31, 2006. Horizon's balance sheets at December 31, 2007 and December 31, 2006, and statements of income and retained earnings for the years then ended are as follows:

**Balance Sheets**

	December 31,	
	2007	2006
<b>Assets</b>		
Current assets		
Cash	\$ 3,500	\$ 3,600

Other, net	<u>17,000</u>	<u>6,000</u>
Total costs and expenses	<u>571,200</u>	<u>474,000</u>
Income before income taxes	\$ 28,800	\$ 26,000

	2007	2006
Income taxes	8,600	7,800
Net income	\$ 20,200	\$ 18,200
Retained earnings at beginning of period, as previously reported	141,000	132,000
Adjustment required for correction of an error	<u>(7,000)</u>	<u>(6,000)</u>
Retained earnings at beginning of period, as restated	\$134,000	\$126,000
Dividends on common stock	<u>12,200</u>	<u>10,200</u>
Retained earnings at end of period	<u>\$142,000</u>	<u>\$134,000</u>

Additional facts are as follows:

- "Selling, general and administrative expenses" for 2007 included a usual but infrequently occurring charge of \$9,000.
- "Other, net" for 2007 included an extraordinary item (charge) of \$10,000. If the extraordinary item (charge) had not occurred, income taxes for 2007 would have been \$11,600, instead of \$8,600.
- "Adjustment required for correction of an error" was a result of a change from an accounting principle that is not generally accepted to one that is generally accepted.
- Horizon Company has a simple capital structure and has disclosed earnings per common share for net income in the Notes to the Financial Statements.

#### Required

- Determine from the preceding additional facts whether or not the presentation of those facts in the Horizon Company statements of income and retained earnings is appropriate. If the presentation is appropriate, discuss the theoretical rationale for the presentation. If the presentation is not appropriate, describe the appropriate presentation and discuss its theoretical rationale. Do not discuss disclosure requirements for the notes to the financial statements.
- Describe the general significance of the following financial analysis tools: (a) quick (acid-test) ratio, (b) inventory turnover, and (c) return on stockholders' equity.
- Based on the Horizon Company balance sheets, statements of income and retained earnings, and additional facts, describe how to determine each of the above financial analysis tools (for the year 2007 only).

**P6-7 AICPA Adapted Multiple-Step Income Statement** Before closing the books for the year ended December 31, 2007, Pitt Corp. prepared the following condensed trial balance:

	Debit	Credit
Total assets	\$ 7,082,500	
Total liabilities		\$ 1,700,000
Common stock		1,250,000
Additional paid-in capital		2,097,500
Donated capital		90,000
Retained earnings, 1/1/07		1,650,000
Net sales		6,250,000
Cost of sales	3,750,000	
Selling and administrative expenses	1,212,500	
Interest expense	122,500	
Gain on sale of long-term investments		130,000
Income tax expense	300,000	
Loss on disposition of plant assets	225,000	
Loss due to earthquake damage	475,000	
	<u>\$13,167,500</u>	<u>\$13,167,500</u>

Other financial data for the year ended December 31, 2007:

#### Federal income tax

Estimated tax payments	\$200,000
Accrued	<u>\$100,000</u>
Total charged to income tax expense (Does not properly reflect current or deferred income tax expense or interperiod income tax allocation for income statement purposes.)	<u>\$300,000</u>

Pitt applied the provisions of FASB Statement No. 109, *Accounting for Income Taxes*, in its financial statements for the year ended December 31, 2007. The enacted tax rate on all types of taxable income for the current and future years is 30%. The alternative minimum tax is less than the regular income tax.

*Temporary difference*

Excess of book basis over tax basis in depreciable assets (arising from equipment donated as a capital contribution on December 31, 2007, and expected to be depreciated over five years beginning in 2008). There were no temporary differences prior to 2007. \$90,000

*Nondeductible expenditure*

Officers' life insurance expense \$70,000

*Earthquake damage*

This damage is considered unusual and infrequent.

*Capital structure*

Common stock, par value \$5 per share, traded on a national exchange:

Number of shares:

Outstanding at 1/1/07	200,000
Issued on 3/30/07 as a 10% stock dividend	20,000
Sold for \$25 per share on 6/30/07	<u>30,000</u>
Outstanding at 12/31/07	<u>250,000</u>

**Required**

- Using the multiple-step format, prepare a formal income statement for Pitt for the year ended December 31, 2007.
- Prepare a schedule to reconcile net income to taxable income reportable on Pitt's tax return for 2007.

**P6-8** *The Coca-Cola Company Disclosures* Review the financial statements and related notes of The Coca-Cola Company in Appendix A.

**Required**

- What was the gross profit for 2004? The operating income?
- What was the net income for 2004? What were the related earnings per share amounts?
- What were the total assets on December 31, 2004? How much of this total were current assets?
- What were the total liabilities on December 31, 2004?
- What was the total shareowners' equity on December 31, 2004? How much was deducted from this shareowners' equity for treasury stock? What method does the company use to account for its treasury stock?
- What was the net increase in cash and cash equivalents in 2004? How much of this was from net cash provided by operating activities?
- Where does the company summarize its accounting policies? How are inventories valued and what costing methods are used? How are property, plant, and equipment depreciated?
- What is the total of the lines of credit and other short-term credit facilities available, and how much was outstanding on December 31, 2004?
- What was the net cash used in financing activities in 2004? What was the net cash used in investing activities in 2004?
- How many stock options were outstanding at December 31, 2004? What was the weighted-average price per share for exercised stock options in 2004?
- What was the net periodic pension cost of the company's pension plan in 2004? What was the fair value of the company's pension benefit plan assets on December 31, 2004?
- For the third quarter of 2004, what were the (a) net operating revenues, (b) gross profit, and (c) net income? What were the related earnings per share for (c)?
- What were the net operating revenues in Africa for 2004? What were the identifiable operating assets held in Latin America at December 31, 2004?
- Who are the auditors of the company? On what date was the audit report issued?
- What is the company's internal control over financial reporting designed to do, and how is it supported?

**P6-9 Horizontal Analysis and Ratios (Appendix)** The following are comparative financial statements of the Cohen Company for 2006, 2007, and 2008:

*Comparative Income Statements*

	For Years Ended December 31,		
	2008	2007	2006
Sales (net)	\$ 102,200	\$ 91,500	\$ 81,700
Cost of goods sold	(61,100)	(52,800)	(47,150)
Gross profit	\$ 41,100	\$ 38,700	\$ 34,550
Selling expenses	(11,400)	(10,000)	(8,900)
Administrative expenses	(8,700)	(7,843)	(6,950)
Interest expense	(3,000)	(4,000)	(4,000)
Total expenses	(23,100)	(21,843)	(19,850)
Income before income taxes	\$ 18,000	\$ 16,857	\$ 14,700
Income tax expense	(5,400)	(5,057)	(4,410)
Net income	\$ 12,600	\$ 11,800	\$ 10,290
Earnings per share	?	?	?

*Comparative Retained Earnings Statements*

	For Years Ended December 31,		
	2008	2007	2006
Beginning retained earnings	\$ 28,800	\$ 20,800	\$ 14,310
Add: Net income	12,600	11,800	10,290
	\$ 41,400	\$ 32,600	\$ 24,600
Less: Dividends distributed	(4,410)	(3,800)	(3,800)
Ending retained earnings	\$ 36,990	\$ 28,800	\$ 20,800

*Comparative Balance Sheets*

	December 31,		
	2008	2007	2006
Cash	\$ 4,200	\$ 4,000	\$ 4,100
Receivables (net)	7,600	7,000	6,200
Inventories	9,800	9,000	8,600
Noncurrent assets	119,390	112,000	107,100
Total Assets	\$140,990	\$132,000	\$126,000
Current liabilities	\$ 12,000	\$ 10,000	\$ 12,000
Bonds payable, 10%	30,000	40,000	40,000
Common stock, \$2 par	8,400	7,600	7,600
Premium on common stock	53,600	45,600	45,600
Retained earnings	36,990	28,800	20,800
Total Liabilities and Stockholders' Equity	\$140,990	\$132,000	\$126,000

*Additional information:* Credit sales were 65% of net sales in 2007 and 60% in 2008. At the beginning of 2008, 400 shares of common stock were issued, the first sale of stock in several years.

The Cohen Company is concerned. Although it increased the dividends paid per share by 5% in 2008 and its 2008 net income is higher than 2007 net income, the market price of its common stock dropped from \$22 per share at the beginning of 2008 to \$21 per share at year-end.

**Required**

- For 2006, 2007, and 2008, prepare horizontal analyses for the Cohen Company using a year-to-year approach.
- For 2007 and 2008, compute the following ratios:
  - Current
  - Acid-test
  - Inventory turnover
  - Receivables turnover

- e. Earnings per share
  - f. Dividend yield
  - g. Return on total assets
  - h. Return on stockholders' equity
  - i. Debt
3. Based on your results, discuss the possible reasons for the decrease in the market price per share in 2008.

**P6-10 Vertical Analysis, Ratios (Appendix)** The Pierce Company operates a high-volume retail outlet. The following are comparative financial statements for the company:

*Comparative Income Statements*

	<u>For Years Ended December 31,</u>	
	2008	2007
Sales (net)	\$180,000	\$150,000
Cost of goods sold	<u>(108,000)</u>	<u>(85,500)</u>
Gross profit	\$ 72,000	\$ 64,500
Selling expenses	(21,600)	(15,000)
Administrative expenses	(23,770)	(23,410)
Interest expense	<u>(3,200)</u>	<u>(2,800)</u>
Income before taxes	\$ 23,430	\$ 23,290
Income tax expense	<u>(7,030)</u>	<u>(6,990)</u>
Net income	<u>\$ 16,400</u>	<u>\$ 16,300</u>
Earnings per share (6,000 shares)	<u>\$2.73</u>	<u>\$2.72</u>

*Comparative Balance Sheets*

	<u>December 31,</u>	
	2008	2007
Cash	\$ 4,200	\$ 3,000
Investments (short-term)	2,000	2,100
Receivables (net)	8,600	6,400
Inventory	11,300	9,700
Noncurrent assets (net)	<u>129,900</u>	<u>118,800</u>
Total Assets	<u>\$156,000</u>	<u>\$140,000</u>
Accounts payable	\$ 12,000	\$ 10,000
Other current liabilities	1,000	2,400
Bonds payable	40,000	35,000
Common stock, \$3 par	18,000	18,000
Additional paid-in capital	30,000	30,000
Retained earnings	54,100	43,600
Accumulated other comprehensive income	<u>900</u>	<u>1,000</u>
Total Liabilities and Stockholders' Equity	<u>\$156,000</u>	<u>\$140,000</u>

*Additional data:* The company has not issued any common stock for several years and the price of its common stock has remained relatively constant over that time. At the beginning of 2007, it had outstanding accounts receivable (net) of \$7,600, an inventory of \$11,000, accounts payable of \$7,400, total liabilities of \$44,600, and stockholders' equity of \$85,400. The company typically makes 50% of its sales on credit.

Pierce Company management has become concerned. Although it feels that progress has been made in "tightening up" the company's operating cycle, this has caused only a modest increase in profits and no increase in the company's stock market price. Management has asked for your assistance in identifying problem areas as well as strong points.

**Required**

1. Prepare a vertical analysis for the 2007 and 2008 financial statements of Pierce.
2. Compute the following ratios for 2007 and 2008:
  - a. Current
  - b. Acid-test
  - c. Inventory turnover
  - d. Receivables turnover
  - e. Payables turnover
  - f. Return on total assets
  - g. Return on stockholders' equity
  - h. Debt
  - i. Interest coverage
3. Briefly discuss any findings that your analyses reveal.

**P6-11 Horizontal and Vertical Analyses (Appendix)** The following are comparative financial statements of the Perez Company for 2006, 2007, and 2008:

**Comparative Income Statements**

	For Years Ended December 31,		
	2008	2007	2006

Beginning retained earnings	64,800	43,200
Common stock dividends	<u>(7,000)</u>	<u>(3,000)</u>
Ending retained earnings	<u>\$ 86,600</u>	<u>\$ 64,800</u>

*Additional information:* The Boeckman Company is listed on the New York Stock Exchange. It issued 1,000 additional shares of common stock at the beginning of 2007. The market value of its common stock was quoted at \$17 per share at December 31, 2007. The company uses a 365-day business year in its ratio analysis.

### Required

- Based on the preceding information, compute (for the year 2007 only) the following ratios for Boeckman:
  - Dividend yield
  - Price/earnings
  - Profit margin
  - Return on total assets
  - Return on stockholders' equity
  - Current
  - Acid-test
  - Inventory turnover (in days)
  - Receivables turnover (in days)
  - Payables turnover (in days)
  - Average operating cycle (in days)
  - Debt
  - Interest coverage
  - Book value per common share
- Briefly discuss what a potential investor might do to evaluate the results of these ratios.

**P6-13 AICPA Adapted Ratio Analysis (Appendix)** The Printing Company is listed on the New York Stock Exchange. The market value of its common stock was quoted at \$10 per share at December 31, 2007 and 2006. Printing's balance sheet at December 31, 2007 and 2006, and statement of income and retained earnings for the years then ended are as follows:

#### Balance Sheet

	<u>December 31,</u>	
	<u>2007</u>	<u>2006</u>
<b>Assets</b>		
<b>Current Assets</b>		
Cash	\$ 3,500,000	\$ 3,600,000

Dividends on preferred stock	<u>200,000</u>	<u>200,000</u>
Ending retained earnings	<u>\$142,000,000</u>	<u>\$134,000,000</u>

**Required**

Based on the preceding information, compute (for the year 2007 only) the following:

- Current (working capital) ratio
- Quick (acid-test) ratio
- Number of days' sales in average receivables, assuming a business year consists of 300 days and all sales are on account
- Inventory turnover
- Book value per share of common stock
- Earnings per share on common stock
- Price/earnings ratio on common stock
- Dividend yield ratio on common stock

## CASES

## COMMUNICATION

**C6-1 Auditor's Report**

Meyer Company is considering being audited for the first time. Mary Thomas, its president, has asked your advice. She says: "I understand that after an audit the certified public accountant issues a report that expresses some opinions, and that one type of report is 'unqualified.' What exactly is involved in an audit, what opinions does the auditor express, and what paragraphs are included in an unqualified audit report?"

**Required**

Prepare a written response to the president of Meyer Company.

**C6-2 Management's Report**

**CMA Adapted** The subject of management reports has been prominent the past few years. A *management report* is included in the annual report to shareholders. This report should not be confused with management's discussion and analysis of operations and financial condition that also is relatively new to the annual report.

The management report is included in the annual report to shareholders as a result of the urging of a number of groups and organizations. Consequently, the form and content of the annual report to shareholders continues to evolve as management attempts to present additional information that will be useful to the readers.

**Required**

1. Explain the general purposes of the management report.
2. Identify five subject areas or topics which have been recommended for inclusion in the management report.
3. Explain why the content of the management report influences the activities of the external auditor during the audit engagement?

**C6-3 Securities and Exchange Commission**

**CMA Adapted** The U.S. Securities and Exchange Commission (SEC) was created in 1934 and consists of five commissioners and a staff of approximately 1,900. The SEC professional staff is organized into four divisions and several principal offices. The primary objectives of the SEC are to

support fair securities markets and to foster enlightened shareholder participation in major corporate decisions. The SEC has a significant presence in financial markets and corporation-shareholder relations and has the authority to exert significant influence on entities whose actions lie within the scope of its authority. The SEC chairman has identified enforcement cases and full disclosure filings as major activities of the SEC.

**Required**

1. The SEC must have some "license" to exercise power. Explain where the SEC receives its authority.
2. Explain, in general, the major ways in which the SEC:
  - a. Supports fair securities markets.
  - b. Fosters enlightened shareholder participation in major corporate decisions.
3. The major responsibilities of the SEC's Division of Corporation Finance include full disclosure filings. Describe the means by which the SEC attempts to assure the material accuracy and completeness of registrants' financial disclosure filings.

**C6-4 Segment Reporting**

To understand current generally accepted accounting principles with respect to accounting for and reporting on the operating segments of a company, as stated in *FASB Statement No. 131*, it is necessary to be familiar with certain terminology. Furthermore, central issues in reporting on operating segments of a company are the determination of which segments are reportable, and what is to be reported.

**Required**

1. Explain what is meant by an operating segment of a company.
2. What are the tests to determine whether or not an operating segment is reportable?
3. Briefly identify the information that a company must disclose in regard to its reportable operating segments.

**C6-5 Interim Reporting**

**AICPA Adapted** Interim financial reporting has become an important topic in accounting. There has been considerable discussion as to the proper method of reflecting

results of operations at interim dates. Accordingly, the Accounting Principles Board issued an opinion clarifying some aspects of interim financial reporting.

#### Required

1. Explain generally how revenue should be recognized at interim dates and specifically how revenue should be recognized for industries subject to large seasonal fluctuations

in revenue and for long-term contracts using the percentage-of-completion method at annual reporting dates.

2. Explain generally how product and period costs should be recognized at interim dates. Also discuss how inventory and cost of goods sold may be afforded special accounting treatment at interim dates.
3. Explain how the provision for income taxes is computed and reflected in interim financial statements.

## CREATIVE AND CRITICAL THINKING

### C6-6 Segment Reporting

**AICPA Adapted** Many accountants and financial analysts contend that a company should report financial data for operating segments of the enterprise.

#### Required

1. Explain what financial reporting for the operating segments of a business enterprise involves.
2. Identify the reasons for requiring financial data to be reported by operating segments.
3. Identify the possible disadvantages of requiring financial data to be reported by operating segments.

### C6-7 Interim Reporting

**AICPA Adapted** The unaudited quarterly statements of income issued by many corporations to their stockholders usually are prepared on the same basis as annual statements, the statement for each quarter reflecting the transactions of that quarter.

#### Required

1. Why do problems arise in using such quarterly statements to predict the income (before extraordinary items) for the year? Explain.
2. Discuss the ways in which quarterly income can be affected by the behavior of the costs recorded in a Repairs and Maintenance of Factory Machinery account.
3. Do such quarterly statements give management opportunities to manipulate the results of operations for a quarter? Explain your answer.

### C6-8 Analyzing Coca-Cola's Segment and Interim Reporting

Refer to the financial statements and related notes of The Coca-Cola Company in Appendix A of this book.

#### Required

1. What are the company's operating segments?

2. What items are subtracted from an operating segment's net operating revenues to determine its profit or loss?
3. What does the North America operating segment include and what was its operating income for 2004?
4. What were the net operating revenues of the Latin America operating segment for 2004? What was the total amount of the net operating revenues of the various operating segments for 2004? How does this amount compare to the net operating revenues reported on the company's consolidated statement of income for 2004?
5. What was the depreciation and amortization of the Asia operating segment for 2004? What was the total amount of the depreciation and amortization of the various operating segments for 2004? How does this amount compare to the depreciation and amortization reported on the company's consolidated statement of cash flows for 2004?
6. What were the company's net operating revenues for the first quarter of 2004? How does this amount compare to the third quarter of 2004?
7. What was the company's gross profit for the second quarter of 2004? How does this amount compare to the second quarter of 2003?
8. What was the company's basic net income per share for the third quarter of 2004? What was the company's full-year net income per share for 2004? How does this amount compare to the basic net income per share reported on the company's consolidated statement of income for 2004?

### C6-9 Ethics and Quarterly Expenses

It is March 2008, and you have just been hired by the Tallas Company to be its accountant. Tallas is a small corporation that does a seasonal business of selling snow removal equipment, with most of its sales to retailers occurring in the last two quarters of the calendar year. Production is particularly heavy during the second quarter, in preparation for these sales. During the first quarter production

is slowest, so this is when Tallas does the majority of its repairs and maintenance on its production equipment.

You are in the process of preparing Tallas Company's 2008 first quarter interim report. After preparing a preliminary income statement, which shows a modest \$30,000 profit, you begin to prepare a preliminary balance sheet. In reviewing the asset accounts in the general ledger, you notice an account entitled Miscellaneous Factory Assets in the amount of \$140,000. Since this is a large amount relative to the other assets and you are unclear how to classify this asset, you ask the controller for an explanation. The controller replies, "Oh that. Just include it under Property, Plant, and Equipment. That is the amount we spent on repairs and maintenance during the first quarter. If we expensed all of it

now, we would show a loss for the first quarter. Instead, we record the amount as an asset, wait to see how the second quarter results are, and then expense some of it so we can show a reasonable profit. The remainder we expense during our busy season of the third and fourth quarters. We have been doing this for years. It makes all of our quarterly income statements look better. Besides, it makes no difference, since our total yearly income is the same regardless of when we report repairs and maintenance expense during the four quarters."

**Required**

From financial reporting and ethical perspectives, when do you think Tallas Company should report its quarterly repairs and maintenance expense?

# Time Value of Money Module

## OBJECTIVES

After reading this Module, you will be able to:

- 1 Understand simple interest and compound interest.
- 2 Compute and use the future value of a single sum.
- 3 Compute and use the present value of a single sum.
- 4 Compute and use the future value of an ordinary annuity.
- 5 Compute and use the future value of an annuity due.
- 6 Compute and use the present value of an ordinary annuity.
- 7 Compute and use the present value of an annuity due.
- 8 Compute and use the present value of a deferred ordinary annuity.
- 9 Explain the conceptual issues regarding the use of present value in financial reporting.

Suppose someone asked you, “Would you rather have \$100 today or \$100 next year?” Your answer should be, “I’d rather have \$100 today.” This reply involves considering the **time value of money**. The difference in worth between the two amounts, the time value of money, is interest. **Interest is the cost of the use of money over time.** It is an expense to the borrower and revenue to the lender. Therefore, it is a very important element in the decision making related to the acquisition and disposal of many of the resources of a company.

Interest concepts are involved in the development of many values that a company reports on its financial statements. Also, managers need to understand the concept of interest when making decisions where cash paid or received *now* must be compared with amounts that will be received or paid in the *future*.

The cash flows at various dates, say some at three years from now, some at two years from now, and some at one year from now, cannot be added together to produce a relevant value. Future cash flows, before they can be added, must be converted to a common denominator by being restated to their present values as of a specific moment in time (often referred to as *time period zero*). The dollars to be received or paid three years from now have a *smaller* present value than those to be received or paid two years or one year from now. **The conversion of these future value amounts to the present value common denominator is known as discounting** and involves the removal of the interest or discount—the time value of money—from those dollars that would be received or paid three years, two years, or one year from now.

Instead of restating some of the cash inflows and outflows to their present values at time period zero, a common denominator is also achieved by stating them at a future value by adding the time value of money (interest) to these inflows and outflows. The future value of any series of inflows or outflows is the sum of these periodic amounts plus the compound interest calculated on the amounts.

A company uses the present value or the future value in many situations, such as (1) for measurement and reporting of some of its assets and liabilities, since many accounting pronouncements require the use of present value concepts in a number of measurement and reporting issues; and (2) when it accumulates information for decision making involving, for example, property, plant, and equipment acquisitions. We discuss these concepts in this Module and we apply them in various chapters when we discuss how a company records and reports (1) long-term notes payable and notes receivable when the interest rate is not specified or differs from the market rate at the time of the transaction, (2) assets acquired by the issuance of long-term debt securities that carry either no stated rate of interest, or a rate of interest that is different from the market rate at the time of the transaction, (3) bonds payable and investments in bonds and the amortization of bond premiums and discounts in each case, (4) long-term leases, (5) various aspects of employees’ post-employment benefits, and (6) impairment of noncurrent assets.

Various compound interest techniques are used in the measurement of the values (costs) of these and other types of transactions. Most compound interest applications can be calculated by a longhand arithmetic process. However, quicker approaches and shortcuts to the solutions of the problems are available. In this Module we illustrate the basic principles of compound interest in a way that leads to the development of tables used to resolve issues introduced throughout this book. Note that many of the calculations are rounded.

## SIMPLE INTEREST AND COMPOUND INTEREST

Simple interest is interest on the original principal (amount originally received or paid) regardless of the number of time periods that have passed or the amount of interest that has been paid or accrued in the past. Interest rates are usually stated as an

annual rate, which is adjusted for any other time period. Thus simple interest is calculated by the following equation:

$$\text{Interest} = \text{Principal} \times \text{Rate} \times \text{Time}$$

where time is either a fraction of a year or a multiple of years. If the term of a note is stated in days, say 90 days, the denominator of the time fraction in the preceding equation is usually stated in terms of a commercial year of 360 days rather than a full year of 365 days. In this practice the year is assumed to be a period of 12 months of 30 days each. For example, the simple interest on a \$10,000, 90-day, 12% note given to a company by Allen Sanders is \$300 ( $\$10,000 \times 0.12 \times 90/360$ ). However, if the term of this note is 15 months, the simple interest is \$1,500 ( $\$10,000 \times 0.12 \times 15/12$ ). Observe that simple interest for more than one year is still calculated on only the principal amount (in this case \$10,000).

**Compound interest is the interest that accrues on both the principal and the past unpaid accrued interest.** Simple interest of 12% for 15 months on the Allen Sanders note is \$1,500. If, on the other hand, the 12% interest is *compounded quarterly* for 15 months (5 quarters), the total compound interest is \$1,592.74, as we show in Example M-1. Note that in the compound interest computation, the future accumulated amount (value) at the end of each quarter becomes the principal sum used to compute the interest for the following period.

1 Understand simple interest and compound interest.

**EXAMPLE M-1 Computation of Quarterly Compounded Interest**

Period	Value at Beginning of Quarter*	× Rate	× Time	= Compound Interest	Value at End of Quarter
1st quarter	\$10,000.00	× 0.12	× 1/4	\$ 300.00	\$10,300.00
2nd quarter	10,300.00	× 0.12	× 1/4	309.00	10,609.00
3rd quarter	10,609.00	× 0.12	× 1/4	318.27	10,927.27
4th quarter	10,927.27	× 0.12	× 1/4	327.82	11,255.09
5th quarter	11,255.09	× 0.12	× 1/4	337.65	11,592.74
Compound interest on \$10,000 at 12% compounded quarterly for 5 quarters				<u>\$1,592.74</u>	

\* This value is the amount on which interest is calculated.

To help solve the many business issues stated in the introductory section of this Module, accountants need to know the various types of compound interest computations. Although there are many variations, there are only four basic types:

1. **Future value (amount) of a single sum** at compound interest
2. **Present value of a single sum** due in the future
3. **Future value (amount) of an annuity**, a series of receipts or payments
4. **Present value of an annuity**, a series of receipts or payments

**FUTURE VALUE OF A SINGLE SUM AT COMPOUND INTEREST**

As we stated previously, the main objective of this Module is to explain shortcut methods to determine and apply the compound interest techniques. We will use the following

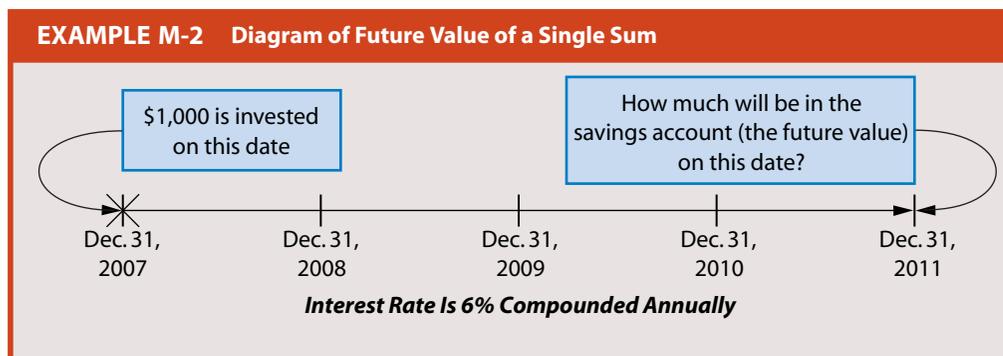

step-by-step procedure, introducing the entire topic *only* with the future value of a single sum at compound interest:

1. We diagram the idea or concept.
2. We make the computation using a longhand calculation.
3. We make the computation using formulas.
4. We discuss the method of constructing and using tables.
5. We illustrate the use of the tables to solve a compound interest problem.

2 Compute and use the future value of a single sum.

### The Idea

The **future value of a single sum at compound interest is the original sum plus the compound interest, stated as of a specific future date.** It is also often referred to as the **future amount** of a single sum. For example, suppose you invest a single amount of \$1,000 in a savings account on December 31, 2007. What will be the amount in the savings account on December 31, 2011 if interest at 6% is compounded annually each year? We show the issue graphically in Example M-2. Most compound interest calculations can be made by applying longhand arithmetic. We follow this procedure here only to clarify the various shortcut devices used.

The future value of \$1,000 for four years at 6% a year can be calculated as we show in Example M-3. The single sum of \$1,000 invested on December 31, 2007 has grown to \$1,262.48 by December 31, 2011. This is the **future value**. The total interest of \$262.48 for the four years is referred to as **compound interest**.

**EXAMPLE M-3 Calculation of Future Value of Single Sum at Compound Interest**

(1) Year	(2) Value at Beginning of Year	(3) Annual Compound Interest (Col. 2 × 0.06)	(4) Future Value at End of Year (Col. 2 + Col. 3)
2008	\$1,000.00	\$60.00	\$1,060.00
2009	1,060.00	63.60	1,123.60
2010	1,123.60	67.42	1,191.02
2011	1,191.02	71.46	1,262.48

A slight variation of the longhand arithmetic approach is to determine what \$1 invested on December 31, 2007 will amount to by December 31, 2011 if interest at 6% is

compounded annually. Then this amount is multiplied by the principal sum to find the future value. In this case, \$1 amounts to \$1.26248 in four years. Knowing this fact, the value of 1,000 different \$1 investments (or \$1,000) at the end of four years can be calculated by multiplying the \$1,000 by 1.26248 as follows:  $\$1,000 \times 1.26248 = \$1,262.48$ . To avoid a significant rounding error in the final results, when solving this problem, the intermediate figures should *not* be rounded to the nearest cent.

### Formula Approach

Each amount in column 4 of Example M-3 is 1.06 times the corresponding amount in column 2. The final future value is therefore  $\$1,000 \times 1.06 \times 1.06 \times 1.06 \times 1.06 = \$1,262.48$ . This means that 1.06 has been used as a multiplier four times; that is, 1.06 has been raised to the fourth power. The future value is therefore \$1,000 multiplied by 1.06 to the fourth power:

$$\text{Future Value} = \$1,000(1.06)^4 = \$1,262.48$$

Thus the formula to compute the future value of a single sum at compound interest is:

$$f = p(1 + i)^n$$

where  $f$  = future value of a single sum at compound interest  $i$  for  $n$  periods

$p$  = principal sum (present value)

$i$  = interest rate for each of the stated time periods

$n$  = number of time periods

It is important to understand that the interest rate  $i$  is the rate of interest applicable for the particular time period for which interest is compounded. For example, a stated annual rate of interest of 12% is

- 12% per year if interest is compounded annually
- 6% per one-half year if interest is compounded semiannually
- 3% per quarter if interest is compounded quarterly
- 1% per month if interest is compounded monthly

In general, an interest rate per period ( $i$ ) is the annual stated rate (sometimes called the nominal rate) divided by the number of compounding time periods in the year, and  $n$  is the number of time periods in the year multiplied by the number of years.

The formula for the future value of 1 is:

$$f_{n,i} = (1 + i)^n$$

where  $f_{n,i}$  is the future compound value of 1 (\$1 or 1 of any other monetary unit) at interest rate  $i$  for  $n$  periods.

Using the preceding formula for the future value of 1, a short formula for the future compound value of any single amount at compound interest is:

$$f = p(f_{n,i})$$

The example of the future value of \$1,000 invested at 6% with interest compounded annually can now be calculated in two steps:

$$\text{Step 1} \quad f_{n=4, i=6\%} = (1.06)^4 = 1.2624796$$

$$\text{Step 2} \quad f = \$1,000(1.2624796) = \$1,262.48$$

Recall that this is exactly the same as the *second* approach, which we used in the previous arithmetic method.

### Table Approach

To develop additional shortcuts to the solution of the compound interest issue, tables for the future value of 1 have been constructed. These tables simply include calculations of

the future values of 1 at different interest rates and for different time periods. They can be constructed by using the preceding formula with the desired interest rates and time periods. For example, suppose that you need tables of the future value of 1 at 2% and 14% for time periods 1 through 4 and for 40 years. The information for these can be calculated as follows:

$$\begin{array}{ll}
 f_{n=1, i=2\%} = (1.02)^1 = 1.020000 & f_{n=1, i=14\%} = (1.14)^1 = 1.140000 \\
 f_{n=2, i=2\%} = (1.02)^2 = 1.040400 & f_{n=2, i=14\%} = (1.14)^2 = 1.299600 \\
 f_{n=3, i=2\%} = (1.02)^3 = 1.061208 & f_{n=3, i=14\%} = (1.14)^3 = 1.481544 \\
 f_{n=4, i=2\%} = (1.02)^4 = 1.082432 & f_{n=4, i=14\%} = (1.14)^4 = 1.688960 \\
 f_{n=40, i=2\%} = (1.02)^{40} = 2.208040 & f_{n=40, i=14\%} = (1.14)^{40} = 188.883514
 \end{array}$$

This information can then be accumulated in a partial table as we show in Example M-4. In this kind of table the factors are shown without the use of the dollar sign. Each factor is an amount for a certain time period and rate. We provide more complete tables at the end of this Module.

EXAMPLE M-4 Future Value of 1 Table $(1 + i)^n$		
Periods	2%	14%
1	1.020000	1.140000
2	1.040400	1.299600
3	1.061208	1.481544
4	1.082432	1.688960
.	.	.
.	.	.
.	.	.
40	2.208040	188.883514

Since the factors in Example M-4 and in Table 1 at the end of this Module are based on the formula  $(1 + i)^n$ , the table approach can be expressed as:

$$f = p(\text{Factor for } f_{n,i})$$

To calculate the future value that \$1,000 will accumulate to in four years at 6% compounded annually, it is necessary to look up the table factor for  $f_{n=4, i=6\%}$ , namely, 1.262477; then, to arrive at the answer of \$1,262.48, the calculation is:  $f = \$1,000(1.262477) = \$1,262.48$ .

## Summary and Illustration

In addition to the straightforward situation of calculating the future value of a single sum at compound interest, you can solve other kinds of problems with the *future value of 1* table.

### Example: Finding an Unstated Interest Rate

If \$1,000 is invested on December 31, 2007 to earn compound interest and if the future value on December 31, 2014 is \$2,998.70, what is the quarterly interest rate on the investment?

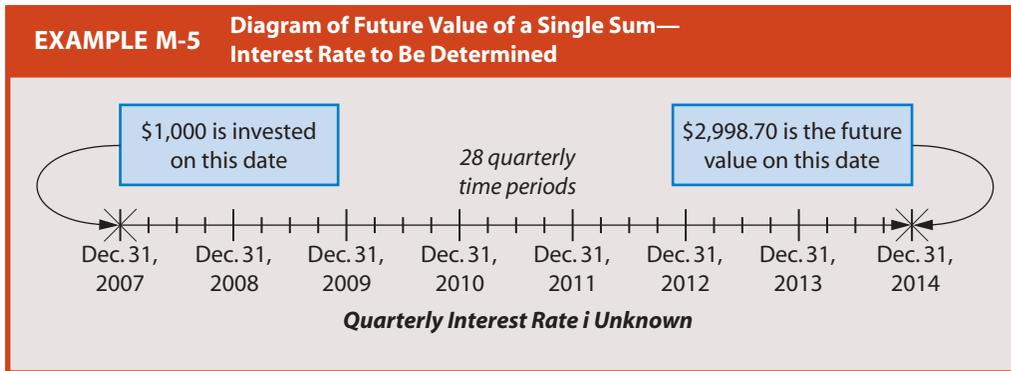

We show the facts in Example M-5. Using the table approach

$$f = p(\text{Factor for } f_{n,i})$$

and substituting in the formula the amounts shown in Example M-5, the factor is determined as follows:

$$\$2,998.70 = \$1,000(\text{Factor for } f_{n=28, i=?})$$

$$\text{Factor for } f_{n=28, i=?} = \frac{\$2,998.70}{\$1,000.00} = 2.99870$$

The factor of 2.99870 is the future value of 1 for 28 time periods at an unknown interest rate. Using the future value of 1 table (Table 1) at the end of this Module, you look down the periods ( $n$ ) column until you get to 28. Then you move horizontally on the  $n = 28$  line to the column factor closest to 2.99870. If the value appears in the table, you can determine the interest rate (shown at the top of the column) that produces this value. In this case, 2.99870 is equal to 2.998703 (rounded) located in the 4% column; thus the quarterly interest rate is 4%. This is often referred to as being a stated annual rate of 16%; you should understand, however, that a quarterly rate of 4% compounded four times yields an effective rate of more than 16%. If the factor of 2.99870 does not appear in the table, an interpolation procedure is required to approximate the quarterly interest rate.<sup>1</sup> Calculators and computer software that compute the interest rate are widely available. ♦

You can solve other problems by using the future amount of 1 tables. Keep in mind, however, that most tables are incomplete. At times it will be necessary to construct tables for odd interest rates and time periods, or to use a calculator or computer software.

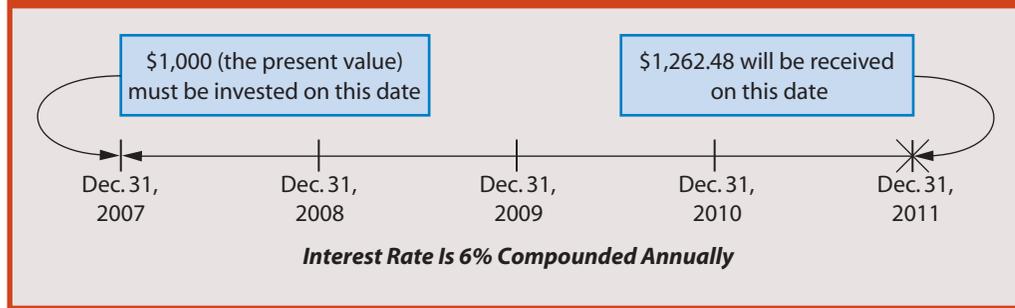

## PRESENT VALUE OF A SINGLE SUM

For the remaining compound interest techniques, we focus on the shortcut approach. After we discuss the idea, we state the formula and use factors derived from the formula.

### The Idea

The present value is the principal that must be invested at time period zero to produce the known future value. Also, discounting is the process of converting the future value to the present value. For example, if \$1,000 is worth \$1,262.48 when it earns 6% compound interest per year for four years, then it follows that \$1,262.48 to be received four years from now is worth \$1,000 now at time period zero; that is, \$1,000 is the present value of \$1,262.48 discounted at 6% for four years. Example M-6 presents this information graphically.

1. You can use the following six steps to determine an interest rate by linear interpolation: (1) Calculate the compound interest factor as shown in the preceding example. (2) Look up in compound interest tables the two interest rates that yield the next largest and the next smallest factors from the calculated factor determined in step 1. (3) Determine (a) the difference between the two factors in step 2, and (b) the difference between the calculated factor from step 1 and the factor of the smaller interest rate from step 2. (4) Find the difference between the two interest rates found in step 2. (5) Apportion the difference in the interest rates in step 4 by multiplying it by a fraction: The numerator is the difference determined in step 3b and the denominator is the difference determined in step 3a. (6) The interest rate is then the lower rate found in step 2 plus the apportioned difference from step 5.

**EXAMPLE M-6** Diagram of Present Value of a Single Sum**Shortcut Approaches**

- 3 Compute and use the present value of a single sum.

While it is possible to calculate the present value of \$1,262.48 to be received at the end of four years discounted at 6% by a longhand approach by reversing the process described in the calculation of the future value, we do not show this approach here. Instead we focus on the development of shortcut approaches to find the present value of a single sum. First we present the formula, then we explain how to create and use factors.

**Formula Approach**

Since the present value of a single future amount is the reciprocal value of the future value of a single sum, the formula for this calculation is:

$$p = f \frac{1}{(1 + i)^n}$$

where  $p$  = present value of any given future value due in the future  
 $f$  = future value  
 $i$  = interest rate for each of the stated time periods  
 $n$  = number of time periods

In this example the present value of \$1,262.48 received at the end of 4 years discounted at 6% is \$1,000, calculated as follows:

$$p = \$1,262.48 \frac{1}{(1.06)^4} = \$1,000$$

The formula for the present value of 1 is:

$$p_{n,i} = \frac{1}{(1 + i)^n}$$

where  $p_{n,i}$  is the present value of 1 (\$1 or 1 of any monetary unit) at interest rate  $i$  for  $n$  periods. It is now possible to express the formula for the present value of any given future amount as:

$$p = f(p_{n,i})$$

The example of the present value of \$1,262.48 to be received four years from now with interest of 6% compounded annually can be calculated in two steps:

$$\text{Step 1} \quad p_{n=4, i=6\%} = \frac{1}{(1.06)^4} = 0.792094$$

$$\text{Step 2} \quad p = \$1,262.48(0.792094) = \$1,000$$

**Table Approach**

Using the formula for  $p_{n,i}$ , tables have been constructed for any interest rate and for any number of periods by simply substituting in the formula the selected various interest

rates for the various time periods desired. Table 3 at the end of this Module shows the factors for the present value of 1 ( $p_{n,i}$ ).

Since the factors in Table 3 are based on the formula  $p_{n,i} = 1/(1 + i)^n$ , the generalized table approach can be stated as:

$$p = f(\text{Factor for } p_{n,i})$$

To calculate the present value of \$1,262.48 to be received at the end of four years, discounted at 6%, look up the factor for  $p_{n=4, i=6\%}$  in Table 3; it is 0.792094. Then the future value of \$1,262.48 is multiplied by this present value of 1 factor to obtain the present value amount of \$1,000, as follows:  $p = \$1,262.48(0.792094) = \$1,000$ .

## Summary and Illustration

In addition to calculating the present value of a single sum using compound interest, you can solve other kinds of problems with the present value of 1 table.

### Example: Finding an Unstated Interest Rate

Assuming that the present value of \$10,000 to be paid at the end of 10 years is \$3,855.43, what interest rate compounded annually is used in the calculation of the present value?

Example M-7 shows the known facts. Since both the present value and the future amount are known, this problem can be solved in two different ways: (1) by using the method we described in the future value section, or (2) by using the present value approach we describe here. Since we discussed the future value approach earlier in this Module, we use only the present value approach here to solve the problem. Using the table approach

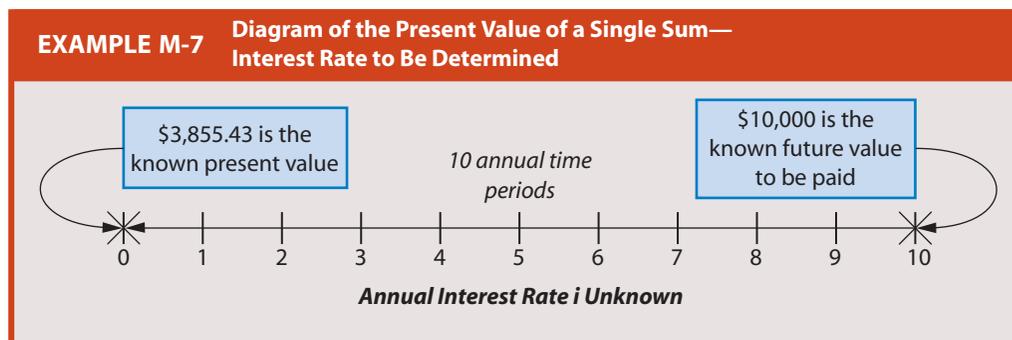

$$p = f(\text{Factor for } p_{n,i})$$

and substituting in the formula the known amounts shown in Example M-7, the factor is determined as follows:

$$\$3,855.43 = \$10,000.00 (\text{Factor for } p_{n=10, i=?})$$

$$\text{Factor for } p_{n=10, i=?} = \frac{\$3,855.43}{\$10,000.00} = 0.385543$$

The factor of 0.385543 is the present value of 1 for 10 periods at an unknown interest rate. Using the present value of 1 table (Table 3), you look down the periods ( $n$ ) column until you get to 10. Then you move horizontally on the  $n = 10$  line to the column factor closest to 0.385543. If the amount appears in the table, you can determine the interest rate (shown at the top of the column) that produces this amount. In this case, 0.385543 is in the 10% column. Thus the annual rate is 10%. If the factor of 0.385543 does not appear in the table, an interpolation procedure is required to approximate the annual interest rate (see footnote 1). ♦

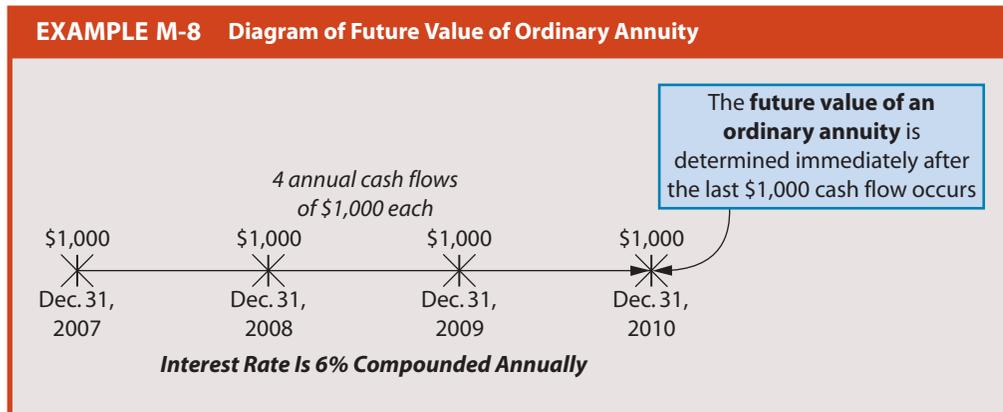

## MEASUREMENTS INVOLVING AN ANNUITY

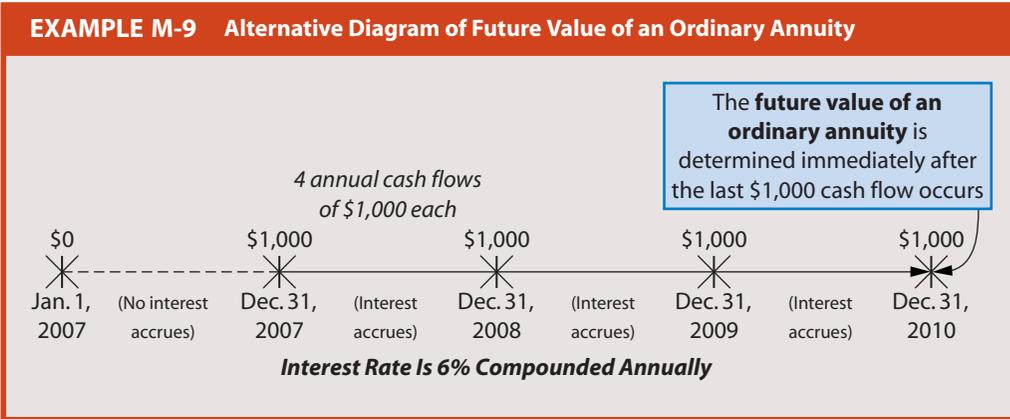

An annuity is a series of equal cash flows (deposits, receipts, payments, or withdrawals), sometimes referred to as *rents*, made at regular intervals with interest compounded at a certain rate. The regular intervals between the cash flows may be any time period—for example, one year, a six-month period, one month, or even one day. In solving measurement problems involving the use of annuities, these four conditions must exist: (1) the periodic cash flows are equal in amount, (2) the time periods between the cash flows are the same length, (3) the interest rate is constant for each time period, and (4) the interest is compounded at the end of each time period.

## FUTURE VALUE OF AN ORDINARY ANNUITY

The future value of an ordinary annuity is determined *immediately* after the last cash flow in the series is made. For the first example, assume that Debbi Whitten wants to calculate the future value of four cash flows of \$1,000, each with interest compounded annually at 6%, where the first \$1,000 cash flow occurs on December 31, 2007 and the last \$1,000 occurs on December 31, 2010. Example M-8 presents this information graphically.

In drawing a **time line** such as that in Example M-8, some accountants prefer to add a beginning time segment to the left of the time when the first cash flow occurs. For example, they would draw the time line for the future amount of an ordinary annuity, as we show in Example M-9. This approach is acceptable if it is understood that the time from January 1, 2007 to December 31, 2007 (which is the period of time immediately *before* the first cash flow occurs) is not used to compute the future value of the ordinary annuity. It is similar to stating a decimal as .4 or 0.4. The zero in front of the decimal may help someone to understand the issue better, but does not change it. In the case of the future value of an ordinary annuity, however, placing the broken line segment to the left of the first cash flow may lead someone to think that the cash flows in an ordinary annuity *must occur* at the end of a given year. That statement is *not* true; the cash flows can occur, for example, on March 15 of each year, or November 5 of each year. For the calculation to be the future value of an *ordinary* annuity, the *future value* is determined *immediately after* the last cash flow in the series occurs. Because of the potential misinterpretation of the information, we prefer not to use the broken line segment to the left of the first cash flow in the time lines describing the future value of an ordinary annuity.

### Shortcut Approaches

#### Formula Approach

The formula for the future value of an ordinary annuity of any amount is:

$$F_0 = C \left[ \frac{(1+i)^n - 1}{i} \right]$$

where  $F_0$  = future value of an ordinary annuity of a series of cash flows of any amount

$C$  = amount of each cash flow

$n$  = number of cash flows (not the number of time periods)

$i$  = interest rate for each of the stated time periods

In the example, the future value of an ordinary annuity of four cash flows of \$1,000 each at 14% compounded annually is as follows:

$$F_0 = \$1,000 \left[ \frac{(1.06)^4 - 1}{0.06} \right] = \$4,374.62$$

The formula for the future value of an ordinary annuity with cash flows of 1 each is as follows:

$$F_{0,n,i} = \left[ \frac{(1+i)^n - 1}{i} \right]$$

where  $F_{0,n,i}$  is the future value of an *ordinary* annuity of  $n$  cash flows of 1 each at interest rate  $i$ .

With the preceding formula for  $F_{0,n,i}$  it is possible to express another formula for the future value of an ordinary annuity of cash flows of any size in this manner:

$$F_0 = C(F_{0,n,i})$$

In a two-step approach, the future value of an ordinary annuity of four cash flows of \$1,000 each at 14% compounded annually is calculated as follows:

**Step 1**  $F_{0,n=4,i=6\%} = \frac{(1.06)^4 - 1}{0.06} = 4.37462$

**Step 2**  $F_0 = \$1,000(4.37462) = \$4,374.62$

This two-step approach is used to solve the problem when factors are not available.

**4** Compute and use the future value of an ordinary annuity.

### Table Approach

The formula for  $F_{0,n,i}$  can be used to construct a table of the future value of any series of cash flows of 1 each for any interest rate. Here the number of cash flows of 1 and the interest rates are substituted into the formula

$$\frac{(1+i)^n - 1}{i}$$

Table 2 at the end of this Module shows the factors for  $F_{0,n,i}$ . Turning to Table 2, observe the following:

1. The numbers in the first column ( $n$ ) represent the number of cash flows.
2. The future values are always equal to or larger than the number of cash flows of 1. For example, the future value of four cash flows of 1 each at 6% is 4.374616. This figure comprises two elements: (a) the number of cash flows of 1 each *without* any interest, and (b) the compound interest on the cash flows, with the exception of the compound interest on the last cash flow in the series, which in the case of an ordinary annuity *does not* earn any interest.

Since Table 2 shows the calculation of  $F_{0,n,i}$  or

$$\frac{(1+i)^n - 1}{i}$$

values, the generalized table approach is as follows:

$$F_0 = C(\text{Factor for } F_{0,n,i})$$

To calculate the future value of an ordinary annuity of 4 cash flows of \$1,000 each at 6%, you must look up the  $F_{0,n=4,i=6\%}$  factor in the future value of an ordinary annuity of 1 table (Table 2); it is 4.374616. Then the amount of each cash flow, here \$1,000, is multiplied by the Table 2 factor to obtain the future value of \$4,374.62:

$$F_0 = \$1,000(4.374616) = \$4,374.62$$

### Summary and Illustration

You can solve several kinds of problems using a future value of an ordinary annuity of 1 table, such as (1) calculating the future value when the cash flows and interest rate are known (the preceding problem); (2) calculating the value of each cash flow where the number of cash flows, interest rate, and future value are known; (3) calculating the number of cash flows when the amount of each cash flow, the interest rate, and the future value are known; and (4) calculating an unknown interest rate when the cash flows and the future value are known. To demonstrate the analysis used in the solution of all these problems, we show item (2) as follows.

#### Example: Determining the Amount of Each Cash Flow Needed to Accumulate a Fund to Retire Debt

At the beginning of 2007 the Rexson Company issued 10-year bonds with a face value of \$1,000,000 due on December 31, 2016. The company will accumulate a fund to retire these bonds at maturity. It will make annual deposits to the fund beginning on December 31, 2007. How much must the company deposit each year, assuming that the fund will earn 12% interest compounded annually?

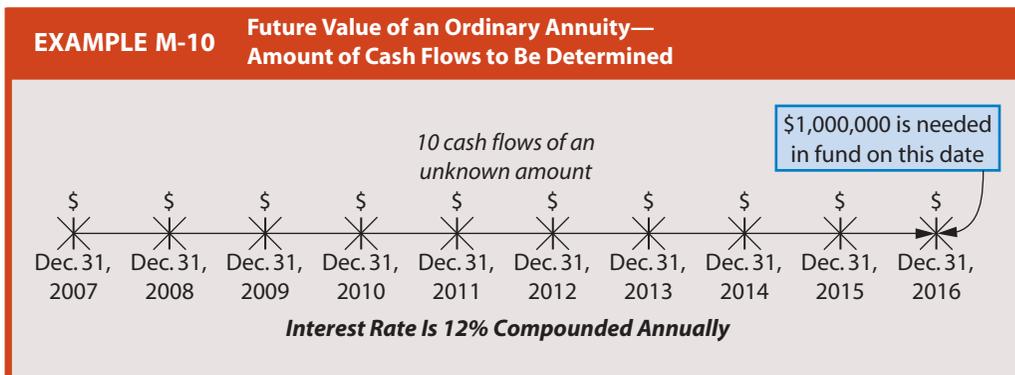

Example M-10 shows the facts of the problem. The future value and the compound interest rate are known. The amount of each of the 10 deposits (cash flows) is the unknown factor. Starting with the formula

$$F_0 = C(\text{Factor for } F_0)$$

and then shifting the elements and substituting the known amount and applicable factor (from Table 2), the amount of each annual deposit is \$56,984.16, calculated as follows:

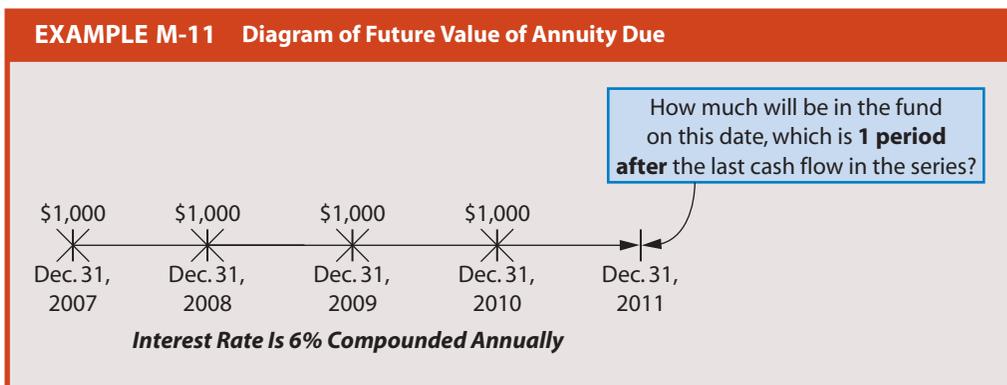

$$\begin{aligned}
 C &= \frac{F_0}{\text{Factor for } F_{0,n,i}} \\
 &= \frac{F_0}{\text{Factor for } F_{0,n=10, i=12\%}} \\
 &= \frac{\$1,000,000}{17.548735} \\
 &= \$56,984.16
 \end{aligned}$$

The 10 annual deposits of \$56,984.16, plus the compound interest, will accumulate to \$1,000,000 by December 31, 2016. ♦

## FUTURE VALUE OF AN ANNUITY DUE

The future value of an annuity due ( $F_d$ ) is determined 1 period after the last cash flow in the series. For example, assume that Ronald Jacobson deposits in a fund four payments of \$1,000 each beginning December 31, 2007, with the last deposit being made on December 31, 2010. How much will be in the fund on December 31, 2011, 1 year after the final payment, if the fund earns interest at 6% compounded annually? Example M-11 shows the facts of this problem.

5 Compute and use the future value of an annuity due.

### Solution Approach

By observing the information contained in Examples M-11 and M-8, you can determine a quick way to compute the future value of an annuity due.<sup>2</sup> When only the future value of an *ordinary* annuity table is available, you can use the factors by completing the following steps:

- Step 1** In the *ordinary* annuity table (Table 2), look up the value of  $n + 1$  cash flows at 6% or the value of 5 cash flows at 6%. 5.637093
- Step 2** Subtract 1 without interest from the value obtained in step 1. (1.000000)
- This is the converted future value factor for  $F_{\overline{d}_{n=4, i=6\%}}$  4.637093
- Step 3** Multiply the amount of each cash flow, here \$1,000, by the converted factor for  $F_{\overline{d}_{n=4, i=6\%}}$  determined in step 2:  
 $F_d = \$1,000(4.637093) = \$4,637.09$

Tables of the future value of an annuity due of cash flows of 1 each are available in some finance books, but not in this book. Therefore, these values must be calculated using the tables for the future value of an *ordinary* annuity. As we showed previously, **the general rule is to use the future value of an ordinary annuity factor for  $n + 1$  cash flows and subtract 1 from the factor.** (Note that we do include in this Module a present value of an annuity due table, as we discuss later.)

## PRESENT VALUE OF AN ANNUITY

The present value of an annuity is the present value of a series of equal cash flows that occur in the future. In other words, it is the amount that must be invested now and, if left to earn compound interest, will provide for a receipt or payment of a series of equal cash flows at regular intervals. Over time, the present value balance is *increased* periodically for interest and is *decreased* periodically for each receipt or payment. Thus, the last cash flow in the series exhausts the balance on deposit.

A company frequently uses the present value of an annuity concept to report many items in its financial statements, as we stated in the introduction to this Module. Because of the importance of the present value of an annuity, we will discuss the (1) present value of an ordinary annuity, (2) present value of an annuity due, and (3) present value of a deferred annuity.

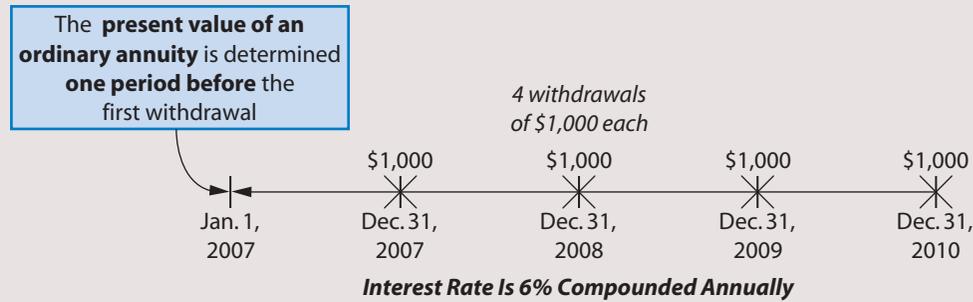

## PRESENT VALUE OF AN ORDINARY ANNUITY

6 Compute and use the present value of an ordinary annuity.

The present value of an ordinary annuity is determined 1 period before the first cash flow in the series is made. For example, assume that Kyle Vasby wants to calculate the present value on January 1, 2007 of four future withdrawals (cash flows) of \$1,000, with the first withdrawal being made on December 31, 2007, 1 year after the determination of the present value. The applicable interest rate is 6% compounded annually. Example M-12 shows this information graphically.

2. An alternative approach is to multiply the future value of an ordinary annuity factor by 1 plus the interest rate. Thus, the future value in this example would be computed as  $\$1,000 \times (4.374616 \times 1.06) = \$4,637.09$ .

**EXAMPLE M-12** Diagram of Present Value of an Ordinary Annuity

**Solving by Determining the Present Value of a Series of Single Sums**

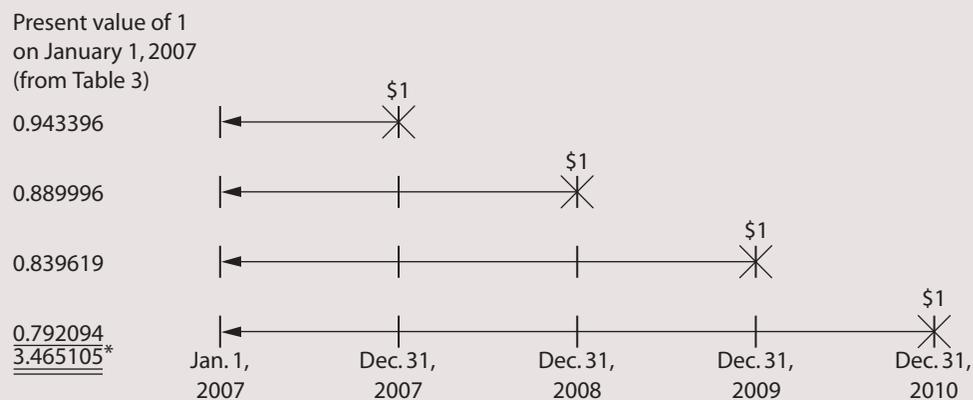

The solution to this problem can be determined by using the present value of a single sum. For instance, the answer can be calculated in the following two steps: (1) determine the present value of four individual cash flows of 1 each for one, two, three, and four years, as we show in Example M-13; and (2) multiply the final results of the summation by \$1,000.

- Step 1**    The present value of four cash flows of 1 for one, two, three, and four years discounted at 6% is determined in Example M-13.
- Step 2**    Now it is possible to determine the present value of the four cash flows of \$1,000 each by multiplying the \$1,000 by 3.465105:  

$$\$1,000 \times 3.465105 = \$3,465.11$$

The present value on January 1, 2007 is \$3,465.11; or we can say that \$3,465.11 must be invested on January 1, 2007 to provide for four withdrawals of \$1,000 each starting on December 31, 2007, given an interest rate of 6%.

**EXAMPLE M-13** Present Value of Four Cash Flows of 1 for One, Two, Three, and Four Years at 6%

\*The value of 3.465105 is slightly smaller than the factor for  $P_{0n=4, i=6\%}$  of 3.465106 in Table 4 discussed later in this section; this is the result of rounding each of the four factors for  $P_{n, i}$ .

## Shortcut Approaches

### Formula Approach

Even though the preceding approach can be used, it is time-consuming for calculations involving a large number of cash flows. The formula for the present value of an ordinary annuity of any amount is:

$$P_0 = C \left[ \frac{1 - \frac{1}{(1+i)^n}}{i} \right]$$

where  $P_0$  = present value of an ordinary annuity of a series of cash flows of any amount

$C$  = amount of each cash flow

$n$  = number of cash flows (not the number of time periods)

$i$  = interest rate for each of the stated time periods

In the example, the present value of an ordinary annuity of four cash flows of \$1,000 each at 6% compounded annually can be calculated as follows:

$$P_0 = \$1,000 \left[ \frac{1 - \frac{1}{(1.06)^4}}{0.06} \right] = \$3,465.11$$

Based on these calculations and formula observe that:

1. The results are the same as those produced in the first approach, \$3,465.11.
2. The formula is developed from the formulas for both the future value of 1 ( $f$ ) and the present value of 1 ( $p$ ):

$$(1 + i)^n = f$$

$$\frac{1}{(1 + i)^n} = p$$

3. Thus the formula can be restated as follows:

$$P_0 = C \left( \frac{1-p}{i} \right)$$

The formula for the present value of an ordinary annuity can be converted to that for a series of cash flows of 1 each as follows:

$$P_{0,n,i} = \left[ \frac{1 - \frac{1}{(1+i)^n}}{i} \right]$$

where  $P_{0,n,i}$  is the present value of an ordinary annuity of  $n$  cash flows of 1 each at interest rate  $i$ . This formula can be expressed for the present value of an ordinary annuity of cash flows of *any size* as:

$$P_0 = C(P_{0,n,i})$$

In a two-step approach the present value of four future withdrawals (cash flows) of \$1,000 each discounted at 6% is recalculated as follows:

$$\text{Step 1} \quad P_{0,n=4,i=6\%} = \left[ \frac{1 - \frac{1}{(1.06)^4}}{0.06} \right] = 3.46511$$

$$\text{Step 2} \quad P_0 = \$1,000(3.46511) = \$3,465.11$$

This calculation is exactly the same as that of the first formula, except that the process is divided into two steps. The two-step approach is the one used when tables of the present value of an ordinary annuity of 1 are available.

### Table Approach

The formula for  $P_{0,n,i}$  can be used to construct a table of the present value of any series of cash flows of 1 each for any interest rate. All that is necessary is to substitute in the formula the desired number of cash flows for the various required interest rates. Table 4 at the end of the Module shows the factors for  $P_{0,n,i}$ . Turning to Table 4, observe the following:

1. The numbers in the first column ( $n$ ) represent the number of cash flows of 1 each. In this calculation the number of cash flows and time periods are equal.
2. The present value amounts are always smaller than the number of cash flows of 1. For example, the present value of three cash flows of 1 at 2% is 2.883883.

Since Table 4 shows the precalculation of  $P_{0,n,i}$  or

$$\frac{1 - \frac{1}{(1+i)^n}}{i}$$

the generalized table approach is as follows:

$$P_0 = C(\text{Factor for } P_{0,n,i})$$

Thus, to calculate the present value on January 1, 2007 of four future withdrawals (cash flows) of \$1,000 discounted at 6%, with the first cash flow being withdrawn on December 31, 2007, it is necessary to look up the  $P_{0,n=4,i=6\%}$  value in the present value of an ordinary annuity of 1 table (Table 4); it is 3.465106. This factor is then multiplied by \$1,000 to determine the present value figure of \$3,465.11:

$$P_0 = \$1,000(3.465106) = \$3,465.11$$

Over the 4 periods, the annuity yields interest each period as follows:

Period	Beginning Balance	Interest	Cash Flow	Ending Balance
1	\$3,465.11	\$207.91	\$(1,000)	\$2,673.02
2	2,673.02	160.38	(1,000)	1,833.40
3	1,833.40	110.00	(1,000)	943.40
4	943.40	56.60	(1,000)	0

### Summary and Illustration

You can solve several kinds of problems by using the present value of an ordinary annuity of 1 table. We present one additional example: a problem involving the calculation of the periodic cash flows when the present value and interest rate are known.

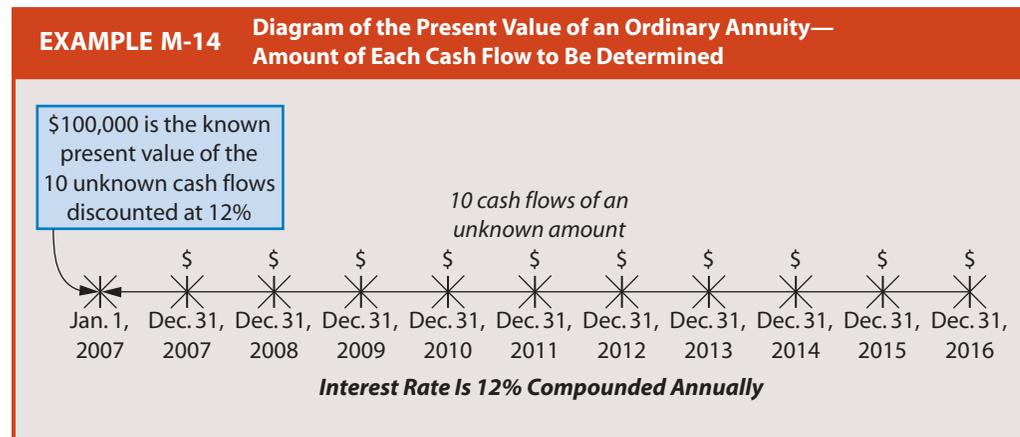

**Example: Determining the Value of Periodic Cash Flows When the Present Value Is Known**

Suppose that on January 1, 2007 Rex Company borrows \$100,000 to finance a plant expansion project. It plans to pay this amount back with interest at 12% in equal annual payments over a 10-year period, with the first payment due on December 31, 2007. What is the amount of each payment?

Example M-14 shows the facts of the problem. The present value and the compound interest rate are known. The amount of each of the 10 cash flows is the unknown item and is \$17,698.42, calculated as follows:

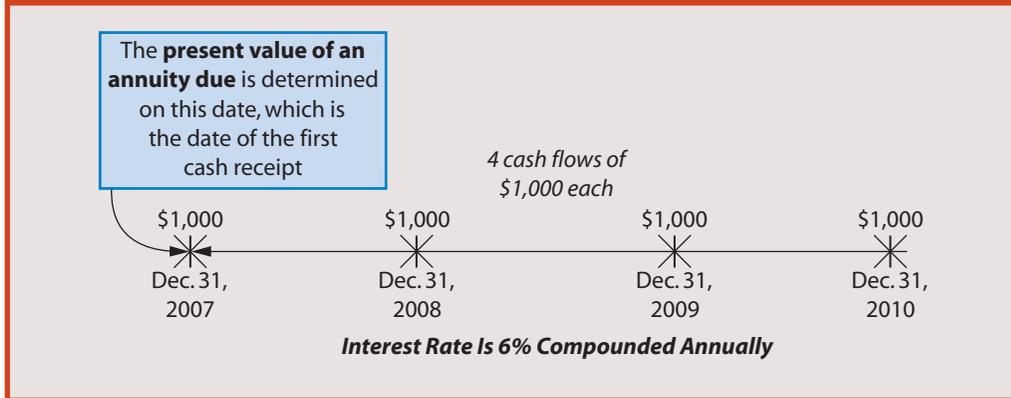

$$\begin{aligned}
 C &= \frac{P_0}{\text{Factor for } P_{0,n,i}} \\
 &= \frac{P_0}{\text{Factor for } P_{0,n=10,i=12\%}} \\
 &= \frac{\$100,000}{5.605223} \\
 &= \$17,698.42
 \end{aligned}$$

Remember that each of these payments of \$17,698.42 includes (1) a payment of annual interest, and (2) a retirement of debt principal. For example, the interest for 2007 is \$12,000 ( $12\% \times \$100,000$ ). Thus the amount of the payment on principal is \$5,698.42 ( $\$17,698.42 - \$12,000$ ). For the year 2008 the interest is \$11,316.19 [ $12\% \times (\$100,000 - \$5,698.42)$ ], and the retirement of principal is \$6,382.23 ( $\$17,698.42 - \$11,316.19$ ). The last payment of \$17,698.42 on December 31, 2016, will be sufficient to retire the remaining principal and to pay the interest for the tenth year. ♦

**PRESENT VALUE OF AN ANNUITY DUE**

The present value of an annuity due ( $P_d$ ) is determined on the date of the first cash flow in the series. For example, assume that Barbara Livingston wants to calculate the present value of an annuity on December 31, 2007, which will permit four annual future receipts of \$1,000 each, the first to be received on December 31, 2007. The interest rate is 6% compounded annually. Example M-15 shows the facts of this problem.

- 7 Compute and use the present value of an annuity due.

**EXAMPLE M-15** Diagram of the Present Value of an Annuity Due**Shortcut Approaches****Formula Approach**

The formula for the present value of an annuity due of any amount is:

$$P_d = C \left[ \frac{1 - \frac{1}{(1+i)^{n-1}}}{i} + 1 \right]$$

where  $P_d$  = present value of an ordinary annuity of a series of cash flows of any amount  
 $C$  = amount of each cash flow  
 $n$  = number of cash flows (not the number of time periods)  
 $i$  = interest rate for each of the stated time periods

In the example, the present value of an annuity due of four cash flows of \$1,000 each at 6% compounded annually is calculated as follows:

$$P_d = \$1,000 \left[ \frac{1 - \frac{1}{1.06^3}}{0.06} + 1 \right] = \$3,673.01$$

The formula for the present value of an annuity due with cash flows of 1 each is:

$$P_{d,n,i} = C \left[ \frac{1 - \frac{1}{(1+i)^{n-1}}}{i} + 1 \right]$$

where  $P_{d,n,i}$  is the present value of an annuity *due* of  $n$  cash flows of 1 each at interest rate  $i$ .

With the preceding formula for  $P_{d,n,i}$  it is possible to express another formula for the future value of an ordinary annuity of cash flows of any size as:

$$P_d = C(P_{d,n,i})$$

In a two-step approach the present value of an annuity due of four cash flows of \$1,000 each at 6% compounded annually is calculated as follows:

$$\text{Step 1} \quad P_{d_{n=4, i=6\%}} = \left[ \frac{1 - \frac{1}{1.06^3}}{0.06} + 1 \right] = 3.673012$$

$$\text{Step 2} \quad P_d = \$1,000(3.673012) = \$3,673.01$$

This two-step approach is used to solve the problem when factors are not available.

### Table Approach

The formula for  $P_{d_{n,i}}$  can be used to construct a table of the future value of any series of cash flows of 1 each for any interest rate. Table 5 at the end of this Module shows the factors for  $P_{d_{n,i}}$ . Since the factors in Table 5 are based on the formula for  $P_{d_{n,i}}$  or

$$\frac{1 - \frac{1}{(1+i)^{n-1}}}{i} + 1$$

values, the generalized table approach is as follows:

$$P_d = C(\text{Factor for } P_{d_{n,i}})$$

To calculate the present value of an annuity due of four cash flows of \$1,000 each at 6%, the  $P_{d_{n=4, i=6\%}}$  factor is found in the present value of an annuity due table (Table 5); it is 3.673012. Then the amount of each cash flow, here \$1,000, is multiplied by the Table 5 factor to obtain the present value of \$3,673.01:

$$P_d = \$1,000(3.673012) = \$3,673.01$$

### Alternative Table Approach

By observing the information contained in Examples M-15 and M-12, you can determine another way to compute the present value of an annuity due.<sup>3</sup> When only the present value of an *ordinary* annuity table is available, you can use the factors to determine the present value of an annuity due by completing the following steps:

- |               |   |                        |
|---------------|---|------------------------|
| <b>Step 1</b> | In the ordinary annuity table (Table 4), look up the present value of $n - 1$ cash flows at 6%, or the value of three cash flows at 6%. | 2.673012               |
| <b>Step 2</b> | Add 1 without interest to the value obtained in step 1.   | <u>1.000000</u>        |
|               | This is the converted present value factor for $P_{d_{n=4, i=6\%}}$ .   | <u><u>3.673012</u></u> |
| <b>Step 3</b> | Multiply the amount of each cash flow, here \$1,000, by the converted factor for $P_{d_{n=4, i=6\%}}$ determined in step 2:             |                        |
|               | $P_d = \$1,000(3.673012) = \$3,673.01$  |                        |

3. An alternative approach is to multiply the present value of an ordinary annuity factor by 1 plus the interest rate, which is consistent with the formula:

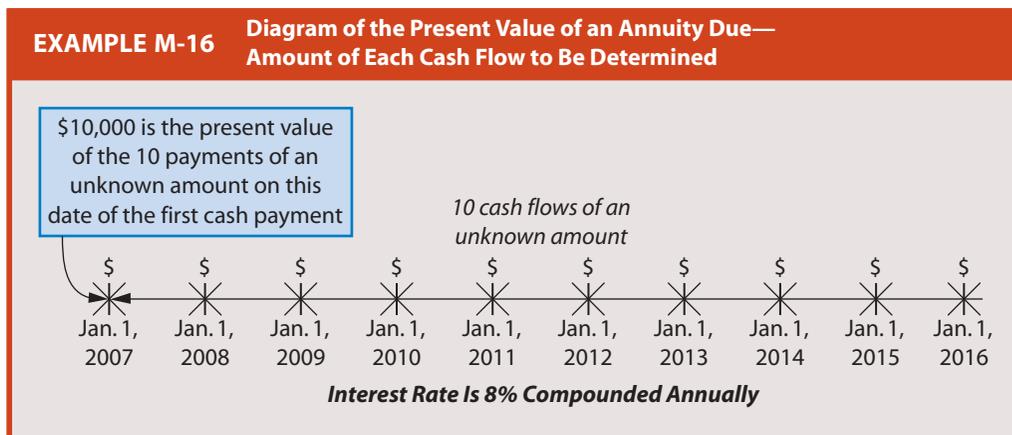

$$\frac{1 - \frac{1}{(1+i)^n}}{i} \times (1+i)$$

Thus, the present value in this example would be computed as  $\$1,000 \times (3.465106 \times 1.06) = \$3,673.01$ .

Thus, if the present value of an annuity due is calculated using tables for the present value of an *ordinary* annuity, the general rule is to use present value of an ordinary annuity factor for  $n - 1$  cash flows and add 1 to the factor.

### Another Application

Besides determining the present value of an annuity due where the amount of each cash flow is known, you can solve other types of problems by using the preceding approaches. Suppose, for example, that Katherine Spruill purchases on January 1, 2007 an item that costs \$10,000. She agrees to pay for this item in 10 equal annual installments, with the first installment on January 1, 2007 as a down payment. The equal installments include interest at 8% on the unpaid balance at the beginning of each year. After the interest is deducted, the balance of each payment reduces the principal of the debt. This problem involves the present value of an annuity due. It requires the determination of the amount of each of 10 cash flows that have a present value of \$10,000 when discounted at an annual rate of 8%. Example M-16 shows these facts graphically.

The solution to this problem requires the rearrangement of the present value of an annuity due formula:

$$C = \frac{P_0}{\text{Factor for } P_{d,n,i}}$$

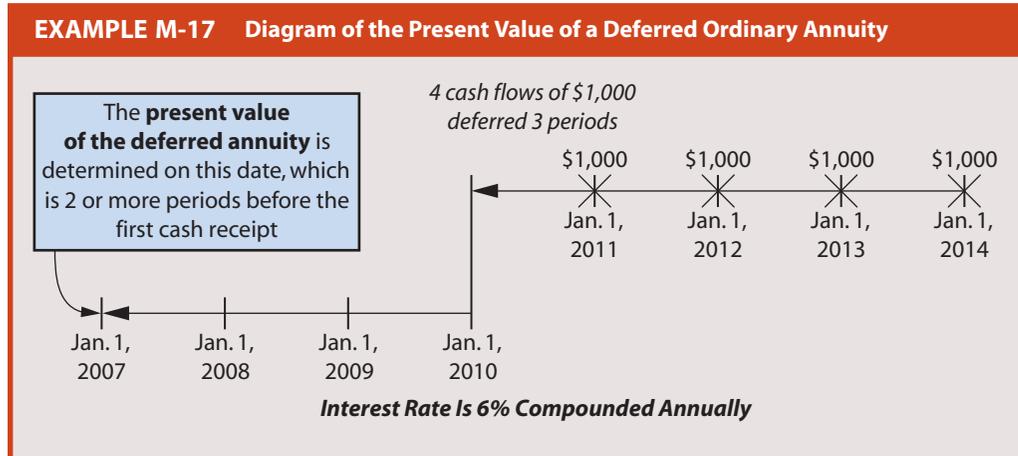

$$= \frac{\$10,000}{7.246888} = \$1,379.90$$

The down payment of \$1,379.90 plus nine more payments of this same amount will retire the principal in nine years, plus pay interest at 8% on the balance of the principal outstanding at the beginning of each year.

## PRESENT VALUE OF A DEFERRED ORDINARY ANNUITY

The present value of a deferred ordinary annuity ( $P_{\text{deferred}}$ ) is determined on a date two or more periods before the first cash flow in the series. Suppose, for example, that Helen Swain buys an annuity on January 1, 2007 that yields her four annual receipts of \$1,000 each, with the first receipt on January 1, 2011. The interest rate is 6% compounded annually. What is the cost of the annuity—that is, what is the present value on January 1, 2007 of the four cash flows of \$1,000 each to be received on January 1, 2011, 2012, 2013, and 2014—discounted at 6%? Example M-17 shows the facts of this problem diagrammatically.

- 8 Compute and use the present value of a deferred ordinary annuity.

There are two ways to compute the present value of a deferred annuity. The first method involves a combination of the present value of an ordinary annuity ( $P_0$ ) and the present value of a single sum due in the future ( $p$ ). For the stated problem it is necessary to determine first the present value of an *ordinary* annuity of four cash flows of \$1,000 each to find a single present value figure discounted to January 1, 2010. Note that because the present value of an ordinary annuity table is used, the present value of the four cash flows is computed on January 1, 2010, *not* January 1, 2011. That single sum is discounted for three more periods at 6% to arrive at the present value on January 1, 2007. Using the factors of \$1 each, the present value is stated as follows:

$$P_{\text{deferred}} = C[(P_{0,n,i})(p_{k,i})]$$

where  $P_{0,n,i}$  = present value of the ordinary annuity of the  $n$  cash flows of 1 at the given interest rate  $i$

$p_{k,i}$  = present value of the single sum of 1 for  $k$  periods of deferment

Substituting appropriate factors from Tables 4 and 3, respectively, in this formula, the following solution is obtained:

$$\begin{aligned} P_{\text{deferred}} &= C[(P_{0,n=4, i=6\%})(p_{k=3, i=6\%})] \\ &= \$1,000[(3.465106)(0.839619)] \\ &= \$2,909.37 \end{aligned}$$

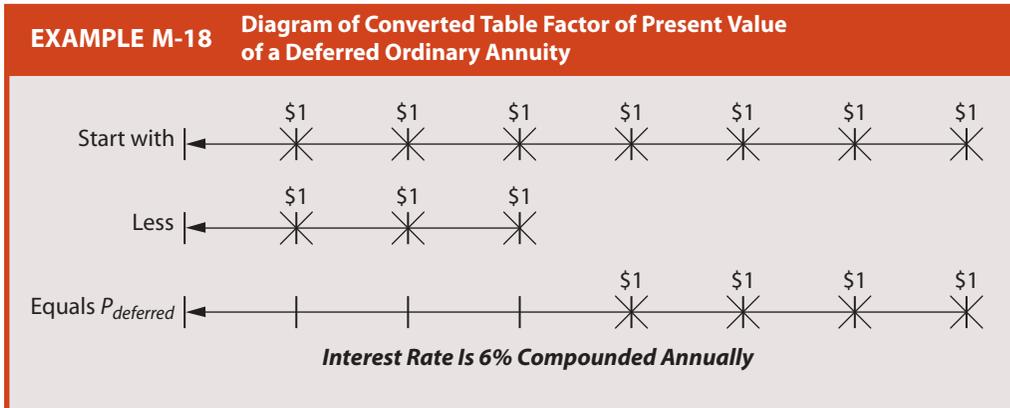

An alternative approach involves a combination of two ordinary annuities. For example, it is possible to calculate the present value of an ordinary annuity of  $n + k$  cash flows of 1. From this amount is subtracted the present value of the  $k$  (the period of deferment, which is 3 in this example) cash flows of 1. This procedure removes the cash flows that were not available to be received; yet the discount factor for the three periods of deferrals on the four cash flows that are to be received remains in the calculated factor. This difference is multiplied by the value of each cash flow to determine the final present value of the deferred annuity. Example M-18 illustrates this approach.

In effect, the present value of an ordinary annuity of  $n + k$  cash flows, minus the present value of an ordinary annuity of the  $k$  cash flows, becomes a converted factor for the present value of a deferred annuity, as follows:

$$P_{\text{deferred}} = C(\text{Converted Factor for Present Value of Deferred Annuity of 1})$$

Using the factors from Table 4, the converted factor for the deferred ordinary annuity stated in the preceding problem is determined as follows:

$$P_{0,n+k=7, i=6\%}(5.582381) - P_{0,k=3, i=6\%}(2.673012) = 2.909369$$

The present value of the four cash flows of \$1,000 each, deferred three periods, is \$2,909.37, calculated as follows:

$$P_{deferred} = \$1,000(2.909369) = \$2,909.37$$

Note that the two methods produce the same present value figure. Also, note that the period of deferment is *only* three periods and *not* four because the present value of an ordinary annuity table is used (see Example M-18 in the second approach). This assumption is required if the problem is to be solved by the use of *ordinary* annuity factors rather than annuity due factors.

### Another Application

Besides determining the present value of a deferred annuity, other types of problems can be solved by using the previous approaches. For example, suppose that David Jones wants to invest \$50,000 on January 1, 2007 so that he may withdraw 10 annual cash flows of equal amounts beginning January 1, 2013. If the fund earns 12% annual interest over its life, what will be the amount of each of the 10 withdrawals?

Example M-19 shows the facts of this problem. A simpler method that can be used to solve this problem is a variation of the second suggested solution. Here, the value of  $C$  can be determined from the following expression of the present value of a deferred annuity formula:

$$C = \frac{P_{deferred}}{\text{Converted Factor for Present Value of Deferred Annuity of 1}}$$

Using Table 4, the converted factor for 10 cash flows of 1 each, deferred 5 periods at 12%, is as follows:

$$\begin{aligned} \text{Converted Factor} &= P_{0_{n+k=15}, i=12\%}(6.810864) - P_{0_{k=5}, i=12\%}(3.604776) \\ &= 3.206088 \end{aligned}$$

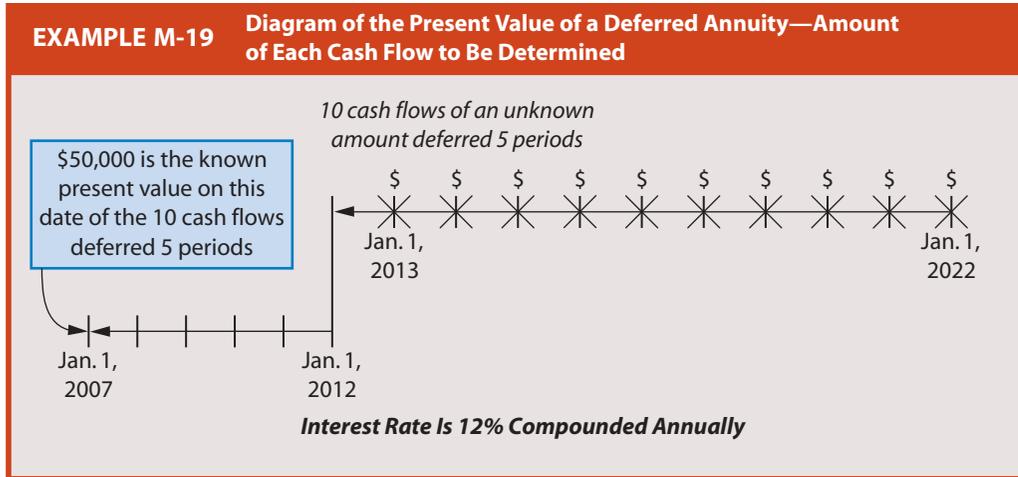

Then the amount of each cash flow is

$$C = \frac{\$50,000}{3.206088} = \$15,595.33$$

The accuracy of the answer produced by the second approach can be tested using the amount of each cash flow and the solution from the first approach. The present value of 10 cash flows of \$15,595.33 deferred 5 periods and discounted at 12% must be \$50,000 if the first solution is correct. The proof can be calculated as follows:

$$\begin{aligned} P_{deferred} &= \$15,595.33[(5.650223)(0.567427)] \\ &= \$50,000 \end{aligned}$$

A slight rounding-error difference may occur with this method because the solution requires the multiplication of two factors,  $P_{0_{n,i}}$  and  $p_{k,i}$  which are rounded.

### SUMMARY OF PRESENT AND FUTURE VALUE CALCULATIONS

The present and future value calculations discussed in this Module may be summarized by the following diagrams:

	Present Value	Future Value
of a single sum for 3 periods	←       \$	\$       →
of a 3-payment ordinary annuity	←   \$   \$   \$	\$   \$   \$ →
of a 3-payment annuity due	\$   \$   \$	\$   \$   \$ →

### CONCEPTUAL EVALUATION OF PRESENT VALUE TECHNIQUES IN FINANCIAL REPORTING

9 Explain the conceptual issues regarding the use of present value in financial reporting.

Accounting principles have evolved without a unifying objective or rationale for determining when present value techniques should and should not be used. Among the issues are the use of present value for the initial valuation of assets and liabilities, the amortization of those assets and liabilities, and any subsequent revaluation when interest rates change.

Present values are used in generally accepted accounting principles for certain monetary items. A monetary item is money or a claim to money that is not affected by changes in the prices of specific goods or services. For example, a note payable is a monetary item, whereas a warranty payable is a nonmonetary item. Monetary items for which present values are used in generally accepted accounting principles include bonds payable and bond investments, long-term notes payable and receivable, leases, and postretirement benefits (e.g., pensions). Present value is not used for items such as deferred income taxes. Some accountants argue that present value should be used for nonmonetary items such as property, plant, and equipment. However, accounting principles have not been extended to the use of present value for these nonmonetary items, except for the impairment of noncurrent assets. Therefore, present values are not used for warranties, unearned revenue, compensated absences, or for nonmonetary assets. We discuss each of these topics in this book.

Most accountants would argue that the use of present value creates a *relevant* accounting measurement. For example, in the situations we discussed earlier, present value amounts are more relevant than, say, the total of the undiscounted cash flows because they represent the equivalent current cash amount. However, the use of present value may create

measurements that are less *reliable* (especially if used for nonmonetary items) because the computation requires:

1. The estimation of the future cash flows, including the timing, amount, and risk of those cash flows.
2. The estimation of the interest rate. Interest rates that could be used include the historical rate, the current rate, the average expected rate, the weighted average cost of capital, or the incremental borrowing rate.<sup>4</sup>
3. The degree to which the cash flows from the individual assets may be added (and the liabilities subtracted) to give a measure of the value of the company.

In 2000, the FASB issued **FASB Statement of Concepts No. 7**, "Using Cash Flow Information and Present Value in Accounting Measurements."<sup>5</sup> The *Statement* provides a framework for using future cash flows as the basis for an accounting measurement of both assets and liabilities. It provides general principles governing the use of present value, as well as the objectives of present value accounting measurements. The *Statement* does not address recognition issues, and therefore does not address when fair value should be based on present value, or when assets or liabilities should be remeasured using present value. It describes five elements that together may be used to determine the value of various assets and liabilities:

1. An estimate of the future cash flow(s) and the timing of those cash flows
2. Estimates about variations in the amount or timing of those cash flows
3. The risk-free interest rate
4. An increase in the interest for any expected risk
5. Other factors, including a lack of liquidity and market imperfections

The methodology introduced in the *Statement* permits development of a fair value using cash flow information even if uncertainties exist about the timing and/or amount of the cash flows. Present value calculations have typically been based on a single set of cash flows and a single discount rate. The *Statement* introduces the concept of "expected cash flows" when using present value techniques for accounting measurements.

Expected cash flows are a probability-weighted average of the range of possible estimated cash flow amounts and/or estimated timing of cash flows. For example, in regard to differing expected amounts, a company may estimate that there is a 20% probability that the cash flow in a given year will be \$1,000, a 50% probability that it will be \$1,200, and a 30% probability that it will be \$1,400. The company would use the expected cash flow of \$1,220  $[(\$1,000 \times 0.20) + (\$1,200 \times 0.50) + (\$1,400 \times 0.30)]$  in its present value calculations. Or in regard to the timing of its cash flows, a company might determine that it has a 30% probability of receiving \$1,000 in one year but a 70% probability of receiving \$1,000 in two years. The present value would be calculated as  $[(30\% \times \text{the present value of } \$1,000 \text{ in one year}) + (70\% \times \text{the present value of } \$1,000 \text{ in two years})]$ .

The *Statement* also discusses the use of present value to estimate the fair value for a transaction between willing parties or to develop entity-specific measurements. The entity-specific value (or value in use) is the value of an asset or liability to a particular entity. In other words, the measurement substitutes the entity's assumptions for those of the market place. The FASB concluded that an entity-specific measurement might be appropriate in some situations. As with all *FASB Statements of Concepts*, the conclusions do not create specific GAAP, but will provide guidance for the development of future *FASB Statements of Financial Accounting Standards*. The FASB has also issued an *Exposure Draft* on fair value measurements that would clarify the use of present value techniques to estimate fair value.<sup>6</sup>

## SUMMARY

At the beginning of the Module, we identified several objectives you would accomplish after reading the Module. The objectives are listed below, each followed by a brief summary of the key points in the Module discussion.

1. **Understand simple interest and compound interest.** Simple interest is interest on the original principal regardless of the number of time periods that have passed or the amount of interest that has been paid or accrued in the past. Compound interest is the interest that accrues on both the principal and the past unpaid accrued interest.
2. **Compute and use the future value of a single sum.** The future value of a single sum is the original sum plus the compound interest, stated as of a specific future date. The future value may be computed using a formula approach or a table approach (Table 1 at the end of this Module).
3. **Compute and use the present value of a single sum.** The present value is the principal that must be invested at time period zero to produce the known future value. Discounting is the process of converting the future value to the present value. The present value may be computed using a formula approach or a table approach (Table 3).
4. **Compute and use the future value of an ordinary annuity.** An annuity is a series of equal cash flows made at regular intervals with interest compounded at a certain rate. The future value of an ordinary annuity is determined immediately after the last cash flow in the series is made. The future value may be computed using a formula approach or a table approach (Table 2).
5. **Compute and use the future value of annuity due.** The future value of an annuity due is determined one period after the last cash flow in the series. The general rule for determining the future value of an annuity due factor is to take the future value of an ordinary annuity factor (Table 2) for  $n + 1$  cash flows and subtract 1 from the factor.
6. **Compute and use the present value of an ordinary annuity.** The present value of an ordinary annuity is determined one period before the first cash flow in the series is made. The present value may be computed using a formula approach or a table approach (Table 4).
7. **Compute and use the present value of annuity due.** The present value of an annuity due is determined on the date of the first cash flow in the series. The present value may be computed using a formula approach or a table approach (Table 5). The general rule for determining the present value of an annuity due factor is to take the present value of an ordinary annuity factor (Table 4) for  $n - 1$  cash flows and add 1 to the factor.
8. **Compute and use the present value of a deferred ordinary annuity.** The present value of a deferred ordinary annuity is determined on a date two or more periods before the first cash flow in the series. The general rule for determining the present value of a deferred ordinary annuity factor is to take the factor for the present value of an ordinary annuity of  $n + k$  cash flows and subtract the factor for the present value of an ordinary annuity of the  $k$  cash flows.
9. **Explain the conceptual issues regarding the use of present value in financial statements.** The conceptual issues include the lack of a unifying objective or rationale for determining when present value techniques should and should not be used. These include the use of present value for the initial valuation of assets and liabilities, the amortization of those assets and liabilities, and any subsequent revaluation when interest rates change. Another issue is that present value may create measurements that are less reliable. In 2000, the FASB issued *FASB Statement of Concepts No. 7, "Using Cash Flow Information and Present Value in Accounting Measurements."* The *Statement* identifies five elements that together may be used to determine the value of various assets and liabilities: (1) an estimate of the future cash flow(s) and the timing of those cash flows, (2) estimates about variations in the amount or timing of those cash flows, (3) the risk-free interest rate, (4) an increase in the interest for any expected risk, and (5) other factors, including a lack of liquidity and market imperfections. The FASB has issued an *Exposure Draft* that would clarify the use of present value to estimate fair value.

## QUESTIONS

**QM-1** Define *interest*. Explain how the cost of interest is similar to the price of any merchandise item.

**QM-2** Discuss the following concepts of interest: *simple interest, compound interest, time value of money, discount*.

**QM-3** Distinguish between the *future value of 1* and the *future value of an ordinary annuity of 1*.

**QM-4** What is the interest rate per period and the frequency of compounding per year in each of the following?

- a. 18% compounded semiannually
- b. 16% compounded quarterly
- c. 15% compounded monthly

**QM-5** Distinguish between the *future value of 1* and the *present value of 1* and between the *present value of 1* and the *present value of an ordinary annuity of 1*.

**QM-6** Distinguish between the *future value of an ordinary annuity* and the *future value of an annuity due*. Draw a time line of each.

**QM-7** Distinguish between the *present value of an annuity due* and the *present value of a deferred annuity*. Draw a time line of each.

**QM-8** Explain how to solve each of the following without tables (in each case use the quickest approach possible):

- The present value of \$10,000 for four years at 10% compounded annually
- The present value of \$5,000 for five years at 10% [start with information developed in (a)]
- The future value of five cash flows of an ordinary annuity of \$3,000 each at 10% compound interest

**QM-9** Potter wishes to deposit a sum that at 12% interest, compounded semiannually, will permit two withdrawals: \$40,000 at the end of 4 years and \$50,000 at the end of 10 years. Analyze the problem to determine the required deposit, stating the procedure to follow and the tables to use in developing the solution.

**QM-10** The following factors are taken from the compound interest tables for the same number of time periods and/or cash flows for the same interest rate:

- 8.137249
- 50.980352
- 6.265060
- 7.142168
- 0.122892

Identify each of the five compound interest table factors without reference to the tables. Discuss briefly.

**QM-11** Explain how to determine the converted table factor for any deferred annuity by using the present value of an ordinary annuity table.

**QM-12** Samuel Ames owes \$20,000 to a friend. He wants to know how much he would have to pay if he paid the debt in three annual installments at the end of each year, which would include interest at 14%. Draw a time line for the problem. Indicate what table to use. Look up the table value and place in a brief formula, but do not solve.

**QM-13** Starting with the given value for  $(1.16)^{10} = 4.411435$ , describe the fastest way to solve each of the following:

- $P_{n=10, i=16\%}$
- $F_{n=20, i=16\%}$
- $F_{0, n=10, i=16\%}$
- $P_{0, n=10, i=16\%}$
- $F_{0, n=20, i=16\%}$

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

Items 1 through 4 require use of present value tables. The following are the present value factors of \$1 discounted at 8% for one to five periods. Each item is based on 8% interest compounded annually from day of deposit to day of withdrawal.

Periods	Present Value of \$1 Discounted at 8% per Period
1	0.926
2	0.857
3	0.794
4	0.735
5	0.681

**MM-1** What amount should be deposited in a bank today to grow to \$1,000 three years from today?

- $\frac{\$1,000}{0.794}$
- $\$1,000 \times 0.926 \times 3$
- $(\$1,000 \times 0.926) + (\$1,000 \times 0.857) + (\$1,000 \times 0.794)$
- $\$1,000 \times 0.794$

**MM-2** What amount should an individual have in his bank account today, before withdrawal, if he needs \$2,000 each year for four years, with the first withdrawal to be made today and each subsequent withdrawal at one-year intervals? (He is to have exactly a zero balance in his bank account after the fourth withdrawal.)

- $\$2,000 + (\$2,000 \times 0.926) + (\$2,000 \times 0.857) + (\$2,000 \times 0.794)$
- $\frac{\$2,000}{0.735} \times 4$

- $(\$2,000 \times 0.926) + (\$2,000 \times 0.857) + (\$2,000 \times 0.794) + (\$2,000 \times 0.735)$
- $\frac{\$2,000}{0.926} \times 4$

**MM-3** If an individual put \$3,000 in a savings account today, what amount of cash will be available two years from today?

- $\$3,000 \times 0.857$
- $\$3,000 \times 0.857 \times 2$
- $\frac{\$3,000}{0.857}$
- $\frac{\$3,000}{0.926} \times 2$

**MM-4** What is the present value today of \$4,000 to be received six years from today?

- $\$4,000 \times 0.926 \times 6$
- $\$4,000 \times 0.794 \times 2$
- $\$4,000 \times 0.681 \times 0.926$
- Cannot be determined from the information given

**MM-5** On January 1, 2007 Kern Company sold a machine to Burns Company. Burns signed a non-interest-bearing note requiring payment of \$30,000 annually for seven years. The first payment was made on January 1, 2007. The prevailing rate of interest for this type of note at the date of issuance was 10%. Information on present value factors is as follows:

Periods	Present Value of 1 at 10%	Present Value of Ordinary Annuity of 1 at 10%
6	0.56	4.36
7	0.51	4.87

**EM-3** *Present Value of a Sum and Compound Discount* Using the present value tables, solve the following problems:

**Required**

1. What is the present value on January 1, 2007 of \$30,000 due on January 1, 2012 and discounted at 12% compounded annually?
2. What is the present value on July 1, 2007 of \$8,000 due January 1, 2012 and discounted at 16% compounded quarterly?
3. What is the compound discount on \$8,000 due at the end of five years at 10% compounded annually?

**EM-4** *Future Value of Annuity* Using appropriate tables, solve the following future value of annuity problems:

**Required**

1. What is the future value on December 31, 2013 of seven cash flows of \$10,000, with the first cash payment being made on December 31, 2007 and interest at 12% being compounded annually?
2. What is the future value on December 31, 2014 of seven cash flows of \$10,000, with the first cash payment made on December 31, 2007 and interest at 12% being compounded annually?

**EM-5** *Present Value of an Annuity* Samuel David wants to make five equal annual withdrawals of \$8,000 from a fund that will earn interest at 10% compounded annually.

**Required**

How much would David have to invest on:

1. January 1, 2007 if the first withdrawal is made on January 1, 2008?
2. January 1, 2007 if the first withdrawal is made on January 1, 2007?

**EM-6** *Amount of Each Cash Flow* Six equal annual contributions are made to a fund, with the first deposit on December 31, 2007.

**Required**

Using the future value tables, determine the equal contributions that, if invested at 10% compounded annually, will produce a fund of \$30,000, assuming that this sum is desired on December 31, 2012.

**EM-7** *Amount of an Annuity* Beginning December 31, 2011, five equal annual withdrawals are to be made.

**Required**

Using the appropriate tables, determine the equal annual withdrawals if \$25,000 is invested at an interest of 12% compounded annually on

1. December 31, 2010
2. December 31, 2011
3. December 31, 2007

**EM-8** *Amount of Each Cash Flow* R. Lee Rouse borrows \$10,000 that is to be repaid in 24 equal monthly installments payable at the end of each subsequent month with interest at the rate of 1½% a month.

**Required**

Using the appropriate table, calculate the equal installments.

**EM-9** *Amount of Each Cash Flow* On January 1, 2007 Charles Jamison borrows \$40,000 from his father to open a business. The son is the beneficiary of a trust created by his favorite aunt from which he will receive \$25,000 on January 1, 2017. He signs an agreement to make this amount payable to his father and, further, to pay his father equal annual amounts from January 1, 2008 to January 1, 2016, inclusive, in retirement of the debt. Interest is 12%.

**Required**

What are the annual payments?

**EM-10** *Amount of an Annuity* Beginning with January 1, 2007, five equal deposits are to be made in a fund.

**Required**

Using the appropriate tables, determine the equal deposits if interest at 10% is compounded annually and if \$200,000 must be in the fund on

1. January 1, 2012
2. January 1, 2013

**EM-11** *Series of Compound Interest Techniques* The following are several situations involving compound interest.

**Required**

Using the appropriate table, solve each of the following:

1. Hope Dearborn invests \$40,000 on January 1, 2007 in a savings account that earns interest of 8% compounded semiannually. What will be the amount in the fund on December 31, 2012?

2. Ben Johnson receives a bonus of \$5,000 each year on December 31. He starts depositing his bonus on December 31, 2007 in a savings account that earns interest of 12% compounded annually. What will be the amount in the fund on December 31, 2011 after he deposits his bonus received on that date?
3. Ron Sewert owes \$30,000 on a non-interest-bearing note due January 1, 2017. He offers to pay the amount on January 1, 2007 provided that it is discounted at 10% on a compound annual discount basis. What would he have to pay on January 1, 2007 under this assumption?
4. June Stickney purchased an annuity on January 1, 2007 which, at a 12% annual rate, would yield \$6,000 each June 30 and December 31 for the next six years. What was the cost of the annuity to Stickney?
5. Five equal annual contributions are to be made to a fund, the first deposit on December 31, 2007. Determine the equal contributions that, if invested at 10% compounded annually, will produce a fund of \$30,000 on December 31, 2012.
6. Beginning on December 31, 2008, six equal annual withdrawals are to be made. Determine the equal annual withdrawals if \$11,000 is invested at 10% interest compounded annually on December 31, 2007.

**EM-12 Amount of an Annuity** John Goodheart wishes to provide for six annual withdrawals of \$3,000 each beginning January 1, 2017. He wishes to make 10 annual deposits beginning January 1, 2007, with the last deposit to be made on January 1, 2016.

#### Required

If the fund earns interest compounded annually at 10%, how much is each of the 10 deposits?

**EM-13 Present Value of Leased Asset** On January 1, 2007 Ashly Farms leased a hay baler from Agrico Tractor Company. Ashly was having cash flow problems, so Agrico drew up the lease to allow Ashly to reestablish itself. The lease requires Ashly to make \$3,000 payments on January 1 of each year for five years beginning in 2007. The interest rate is 12%.

#### Required

Calculate the present value of the cost of the lease payments to Ashly on January 1, 2007.

**EM-14 Number of Cash Flows** On July 1, 2007 Boston Company purchased a machine at a cost of \$80,000. It paid \$56,046.06 in cash and signed a 10% note for the difference. This note is to be paid off in annual installments of \$5,000 each, payable each July 1, beginning immediately. The \$5,000 includes a payment of interest on the balance of the principal at the beginning of each period and a payment on the principal.

#### Required

Calculate the number of annual payments to be made by Boston Company.

## PROBLEMS

**PM-1 Future Value of an Investment** Using the future value tables, solve the following:

#### Required

1. What is the future value on December 31, 2011 of a deposit of \$35,000 made on December 31, 2007 assuming interest of 10% compounded annually?
2. What is the future value on December 31, 2011 of a deposit of \$10,000 made on December 31, 2007 assuming interest of 16% compounded quarterly?
3. What is the future value on December 31, 2011 of a deposit of \$25,000 made on December 31, 2007 assuming interest of 12% compounded semiannually?

**PM-2 Present Value Issues** Using the present value tables, solve the following:

#### Required

1. What is the present value on January 1, 2007 of \$30,000 due on January 1, 2011 and discounted at 10% compounded annually?
2. What is the present value on January 1, 2007 of \$40,000 due on January 1, 2011 and discounted at 11% compounded semiannually?
3. What is the present value on January 1, 2007 of \$50,000 due on January 1, 2011 and discounted at 16% compounded quarterly?

**PM-3 Future Value Issues** Using the future values tables, solve the following:

#### Required

1. What is the future value on December 31, 2016 of 10 cash flows of \$20,000 with the first cash payment made on December 31, 2007 and interest at 10% being compounded annually?

2. What is the future value on June 30, 2017 of 20 cash flows of \$15,000 with the first cash payment made on December 31, 2007 and the annual interest rate of 10% being compounded semiannually?
3. What is the future value on December 31, 2017 of 20 cash flows of \$15,000 with the first cash payment made on December 31, 2007 and the annual interest rate of 10% being compounded semiannually?

**PM-4** *Amount of Each Cash Flow* On December 31, 2014 Michael McDowell desires to have \$60,000. He plans to make six deposits in a fund to provide this amount. Interest is compounded annually at 12%.

**Required**

Compute the equal annual amounts that McDowell must deposit assuming that he makes the first deposit on

1. December 31, 2009
2. December 31, 2008

**PM-5** *Value of an Annuity* John Joshua wants to make five equal annual withdrawals of \$20,000 from a fund that will earn interest at 12% compounded annually.

**Required**

How much would Joshua have to invest on January 1, 2007 if he makes the first withdrawal on

1. January 1, 2008?
2. January 1, 2007?
3. January 1, 2012?

**PM-6** *Value of an Annuity* Ralph Benke wants to make eight equal semiannual withdrawals of \$8,000 from a fund that will earn interest at 11% compounded semiannually.

**Required**

How much would Benke have to invest on:

1. January 1, 2007 if the first withdrawal is made on July 1, 2007?
2. July 1, 2007 if the first withdrawal is made on July 1, 2007?
3. January 1, 2007 if the first withdrawal is made on January 1, 2010?

**PM-7** *Various Compound Interest Issues* You are given the following situations:

1. Thomas Petry owes a debt of \$7,000 from the purchase of a boat. The debt bears interest of 12% payable annually. Petry will pay the debt and interest in five annual installments beginning in one year. Calculate the equal annual installments that will pay off the debt and interest at 12% on the unpaid balance.
2. On January 1, 2007 John Cothran offers to buy Ruth House's used tractor and equipment for \$4,000 payable in 12 equal semiannual installments, which are to include payment of 10% interest on the unpaid balance and payment of a portion of the principal, with the first installment to be made on January 1, 2007. Calculate the amount of each of these installments.
3. Nadine Love invests in a \$60,000 annuity at 12% compounded annually on March 1, 2007. The first of 15 receipts from the annuity is payable to Love on March 1, 2017, 10 years after the annuity is purchased and on the date Love expects to retire. Calculate the amount of each of the 15 equal annual receipts.

**Required**

Using the appropriate tables, solve each of the preceding situations.

**PM-8** *Value of an Annuity* Using the appropriate tables, solve each of the following:

**Required**

1. Beginning December 31, 2008, five equal withdrawals are to be made. Determine the equal annual withdrawals if \$30,000 is invested at 10% interest compounded annually on December 31, 2007.
2. Ten payments of \$3,000 are due at annual intervals beginning June 30, 2008. What amount will be accepted in cancellation of this series of payments on June 30, 2007 assuming a discount rate of 14% compounded annually?
3. Ten payments of \$2,000 are due at annual intervals beginning December 31, 2007. What amount will be accepted in cancellation of this series of payments on January 1, 2007 assuming a discount rate of 12% compounded annually?

**PM-9** *Amount of Each Cash Flow* On January 1, 2007 Philip Holding invests \$40,000 in an annuity to provide eight equal semiannual payments. Interest is 10%, compounded semiannually.

**Required**

Compute the equal semiannual amounts that Holding will receive, assuming that the first withdrawal is to be received on

1. July 1, 2007
2. January 1, 2007
3. July 1, 2010
4. January 1, 2012

**PM-10** *Number of Cash Flows* The following are two independent situations.

1. Houser wishes to accumulate a fund of \$40,000 for the purchase of a house and lot. He plans to deposit \$4,000 semiannually at the end of each six months. Assuming interest at 14% a year compounded semiannually, how many deposits of \$4,000 each will be required and what is the amount of the last deposit?
2. On January 1, 2007 Joan Campbell borrows \$20,000 from Susan Rone and agrees to repay this amount in payments of \$4,000 a year until the debt is paid in full. Payments are to be of an equal amount and are to include interest at 12% on the unpaid balance of principal at the beginning of each period. Assuming that the first payment is to be made on January 1, 2008, determine the number of payments of \$4,000 each to be made and the amount of the final payment.

**Required**

Using the appropriate tables, solve each of the preceding situations.

**PM-11** *Serial Installments; Amounts Applicable to Interest and Principal* Ronald McDuffie purchases a new car at a cost of \$14,400. He pays \$3,000 down and issues an installment note payable by which he promises to pay the balance in 18 equal monthly installments, which include interest at an annual rate of 18% on the remaining unpaid balance at the beginning of each month, starting with the first month after the purchase.

**Required**

1. Compute the equal installment payments.
2. Compute the interest that will be paid for each of the first two periods. Indicate the amount of each payment that will be a reduction of principal.

**PM-12** *Determining Loan Repayments* Rockness needs \$40,000 to pay off a loan due on December 31, 2016. His plans included the making of 10 annual deposits beginning on December 31, 2007 in accumulating a fund to pay off the loan. Without making a precise calculation, Rockness made three annual deposits of \$4,000 each on December 31, 2007, 2008, and 2009, which have been earning interest at 10% compounded annually.

**Required**

What is the equal amount of each of the next seven deposits for the period December 31, 2010 to December 31, 2016 to reach the fund objective, assuming that the fund will continue to earn interest at 10% compounded annually?

**PM-13** *Purchase of Asset* William Thomas intends to purchase a tractor on credit. Two local implement dealers have offered him the following payment plans for identical tractors:

1. Redd Truck & Tractor's plan calls for five annual payments of \$10,350, with the first payment now and the remaining payments at the beginning of each of the next four years.
2. Greene Farm Implements requires semiannual payments of \$5,750 at the end of each of the next 10 semiannual periods, with the first payment to be in six months.

**Required**

Determine which of the preceding plans offers Thomas the lower present value. The applicable annual interest rate is 10% for both alternatives.

**PM-14** *Fund to Retire Bonds* At the beginning of 2007 Shanklin Company issued 10-year bonds with a face value of \$1,000,000 due on December 31, 2016. The company wants to accumulate a fund to retire these bonds at maturity by making annual deposits beginning on December 31, 2007.

**Required**

How much must the company deposit each year, assuming that the fund will earn 12% interest a year compounded annually?

**PM-15** *Asset Purchase Price* BWP, Inc., is considering the purchase of an asset. BWP's required rate of return on new assets is 12%. The expected net cash inflows generated by the new asset are as follows:

Years	Amount	Nature of the Cash Inflows
1-4	\$3,000	Net operating revenues
5-9	2,500	Net operating revenues
10	2,000	Net operating revenues
10	1,000	Sale of asset

**Required**

Given that the net cash inflows can be realized, what is the maximum amount BWP should be willing to pay for the new asset? Assume that each cash inflow occurs at the end of the year. (Contributed by Norma C. Powell)

**PM-16** *Acquisition of Asset* SuMar Company purchased a new piece of machinery by paying \$2,000 down and agreeing to pay \$1,000 at the end of each year for five years. The appropriate interest rate is 8%.

**Required**

1. What is the cost of the machinery?

- Prepare the journal entry to record the purchase of the machinery.
- Prepare a table that shows the interest and ending balance of the liability each year. (*Contributed by Norma C. Powell*)

**PM-17 Present Value Issues** Nello Construction Company has just purchased several major pieces of road-building equipment. Since the purchase price is so large, the equipment company is giving Nello an option of choosing one of four different payment plans:

- \$600,000 immediately in cash.
- \$200,000 down payment now; \$65,000 per year for 12 years, beginning at the end of the current year.
- \$200,000 down payment now; \$25,000 per year for 3 years beginning at the end of the current year; \$75,000 per year for 11 years beginning at the end of the fourth year after the purchase.
- \$80,000 now and at the beginning of each of the next 13 years.

#### Required

You have been asked by the Nello Construction Company to decide which payment plan will provide the smallest present value. The expected effective interest rate during the future periods stated above is 12%.

#### PM-18 AICPA Adapted Comprehensive

*Part a.* Reproduced in the following table are the first three lines from the 2% columns of each of several tables of mathematical values. For each of the following items, you are to select from among these fragmentary tables the one from which the amount required can be obtained *most directly* (assuming that the complete table was available in each instance):

Periods	Table A	Table B	Table C	Table D	Table E	Table F
0	1.0000		1.0000			
1	0.9804	1.0200	1.0200	1.0000	0.9804	1.0200
2	0.9612	2.0604	1.0404	0.4950	1.9416	0.5150
3		3.1216		0.3268	2.8839	0.3468

- The amount to which a single sum would accumulate at compound interest by the end of a specified period (interest compounded annually).
- The amount that must be appropriated at the end of each of a specific number of years to provide for the accumulation, at annually compounded interest, of a certain sum.
- The amount that must be deposited in a fund that will earn interest at a specified rate, compounded annually, in order to make possible the withdrawal of certain equal sums annually over a specified period starting one year from date of deposit.
- The amount of interest that will accumulate on a single deposit by the end of a specified period (interest compounded semiannually).
- The amount, net of compound discount, that if paid now would settle a debt of larger amount due at a specified future date.

*Part b.* The following tables of values at 10% interest may be used as needed to answer the questions in this part of the problem.

Periods	Future Value of 1 at Compound Interest	Present Value of 1 at Compound Interest	Future Value of Annuity of 1 at End of Each Period	Present Value of Annuity of 1 at End of Each Period
1	1.100	0.9091	1.0000	0.9091
.	.	.	.	.
.	.	.	.	.
.	.	.	.	.
6	1.7716	0.5645	7.7156	4.3553
7	1.9487	0.5132	9.4872	4.8684
8	2.1436	0.4665	11.4359	5.3349
9	2.3579	0.4241	13.5795	5.7590
10	2.5937	0.3855	15.9374	6.1446
11	2.8531	0.3505	18.5312	6.4951
12	3.1384	0.3186	21.3843	6.8137
13	3.4523	0.2897	24.5227	7.1034
14	3.7975	0.2633	27.9750	7.3667
15	4.1772	0.2394	31.7725	7.6061
16	4.5950	0.2176	35.9497	7.8237

- Your client has made annual payments of \$2,500 into a fund at the close of each year for the past three years. The fund balance immediately after the third payment totaled \$8,275. He has asked you how many more \$2,500 annual payments

will be required to bring the fund to \$22,500, assuming that the fund continues to earn interest at 10% compounded annually. Compute the number of full payments required and the amount of the final payment if it does not require the entire \$2,500. Carefully label all computations supporting your answer.

- Your client wishes to provide for the payment of an obligation of \$200,000 due on July 1, 2014. He plans to deposit \$20,000 in a special fund each July 1 for 7 years, starting July 1, 2008. He wishes to make an initial deposit on July 1, 2007 of an amount that, with its accumulated interest, will bring the fund up to \$200,000 at the maturity of the obligation. He expects that the fund will earn interest at the rate of 10% compounded annually. Compute the amount to be deposited July 1, 2007. Carefully label all computations supporting your answer.

**PM-19 Comprehensive** The following are three independent situations:

- M. Herman has decided to set up a scholarship fund for students. She is willing to deposit \$5,000 in a trust fund at the end of each year for 10 years. She wants the trust fund to then pay annual scholarships at the end of each year for 30 years.
- Charles Jordy is planning to save for his retirement. He has decided that he can save \$3,000 at the end of each year for the next 10 years, \$5,000 at the end of each year for years 11 through 20, and \$10,000 at the end of each year for years 21 through 30.
- Patricia Karpas has \$200,000 in savings on the day she retires. She intends to spend \$2,000 per month traveling around the world for the next two years, during which time her savings will earn 18%, compounded monthly. For the next five years, she intends to spend \$6,000 every six months, during which time her savings will earn 12%, compounded semiannually. For the rest of her life expectancy of 15 years, she wants an annuity to cover her living costs. During this period her savings will earn 10% compounded annually. Assume that all payments occur at the end of each period.

#### Required

- In Situation 1, how much will the annual scholarships be if the fund can earn 6%? 10%?
- In Situation 2,
  - How much will Jordy have at the end of 30 years if his savings can earn 10%? 6%?
  - If Jordy expects to live for 20 years in retirement, how much can he spend each year if his savings earn 10%? 6%?
  - How much would Jordy need to invest today to have the same amount available at the time he retires as calculated in 2(a) at 10%? 6%?
- In Situation 3, how much will Karpas's annuity be?

## CASES

### CM-1 Cost of Insurance Plans

The Johnson Company is considering three different time periods for an insurance policy on its main office building. The premiums on a fire insurance policy covering the building for the amount of \$2,000,000 on a one-year, three-year, and five-year basis are as follows:

One year	\$ 4,480
Three years	11,200
Five years	17,920

In each case the entire premium for the full term of the policy is payable at the beginning of the year in which the policy is purchased.

#### Required

Evaluate the annual cost of each insurance plan for the insured, assuming that money is worth 12% compounded annually. Which plan do you recommend? State the savings for the company.

### CM-2 Acquisition of Equipment

The manager of the Taylor Company has consulted you, the controller, as to which of the following plans you would recommend in acquiring the use of a piece of heavy equipment:

- Purchase the equipment and pay immediately a cash price of \$36,800. The service life of the heavy equipment

is estimated to be five years, with a resale value at the end of that time of \$5,500.

- Lease the equipment at the rate of \$9,100 per year for five years, payable at the beginning of each year.

#### Required

Assuming that the time value of money is 12%, evaluate the two alternatives and indicate which plan you would recommend to the manager, stating the value of savings to the company.

### CM-3 Effective Interest in Various Situations

On March 1, 2007 the White Company purchased \$400,000 worth of inventory on credit with terms of 1/20, n/60. In the past, White has always followed the policy of making payment one month (30 days) after the goods are purchased.

A new member of White's staff has indicated that the company he previously worked for never passed up its cash discounts, and he wonders if this is not a sound policy. It was pointed out, however, that if White were to pay the bill on March 20 rather than on March 30, it would have to borrow the necessary funds for the 10 extra days. White's borrowing terms with a local bank were estimated to be at 14% (annual rate), with a 15% compensating balance (a requirement by the bank that White maintain an amount in its account equal to 15% of the loan) for the term of the loan. Most members of White's staff felt that it made little sense to take out a 14% loan

with a compensating balance of 15% in order to save 1% on \$400,000 by paying the account 10 days earlier than planned.

#### Required

- In terms of simple effective annual interest cost, explain whether it would be to White's advantage to borrow the amount necessary to take the 1% discount by paying the bill 10 days early.
- It has also been pointed out to White that if it does not take advantage of the cash discount, it should wait the entire 60-day period to pay the full bill rather than pay within 30 days. Explain how your answer to Requirement 1 would change if White undertook this policy.
- Your answer to Requirement 2 indicates that, in relation to Requirement 1, it has become either more desirable or less desirable to borrow in order to take advantage of the 1% cash discount.
  - If you said *more desirable*, explain why.
  - If you said *less desirable*, make a similar explanation.

#### CM-4 Future Value of Single Investment and Annuity

Jane Dough was a teller in a large northeastern bank. She was single and approaching age 30, and she considered herself an honest and upright citizen. After considering what she might do to build a retirement plan for the future, she decided to embezzle \$1,500,000. Subsequently she gave herself up to the authorities but did not return the \$1,500,000. She was tried, convicted, and sentenced to 20 years in prison. After completing her 20-year term, she returned the \$1,500,000 that she had stolen. She then decided to take a world cruise. On the ship someone asked her how she had accumulated enough money to afford the trip. She replied, "Do you know how much *interest* \$1,500,000 will earn in 20 years if invested at an annual rate of 16% compounded quarterly?"

#### Required

- Determine the answer to Jane Dough's question. The table factor for  $f_{n=40, i=4\%}$  is 4.801021.
- Evaluate Jane's retirement decision, assuming that she could have earned \$21,000 each year for each of the 20 years she was in prison. Assume that \$11,000 is

required each year to cover living expenses and that she could have invested the remaining \$10,000 at the end of each year to earn interest at 16% compounded annually.

#### CM-5 Value of a Note

You have just been promoted to manager at a national CPA firm. On your first job a new accountant approaches you with the following situation: He has discovered that the president of the client company has a brother who is both the major stockholder and the president of a local bank. Your client has a \$300,000, five-year note payable to the bank at 4% interest compounded annually. Since the going interest rate is 16%, the accountant suggests that the note be recorded at its present value using this going rate. The president says that the effective liability is \$300,000 and should be reported on the balance sheet at this figure. The note was issued on January 1, 2007 and is due on January 1, 2012.

#### Required

- Explain who is correct.
- At what amount should the company have valued the note on January 1, 2007, assuming that the accountant's assessment is correct?

#### CM-6 Future Value and Present Value Issues

Jean Perry has a \$25,000 whole-life insurance policy that she began many years ago. She is presently 55 years old. One of the benefits of the policy is that Perry can borrow up to a given amount at 12% interest (2% below the current rate), with the principal due two years after the loan is made. The policy states that should Perry default on the principal payment, it will simply be deducted from the amount given her beneficiary when she dies. However, the interest will continue to accrue as long as the note is not paid. Perry has just borrowed \$5,000 on this policy to take a vacation in Hawaii.

#### Required

Assuming that a woman of Perry's health is expected to live to be 72, explain whether it would be financially advantageous for Perry to repay the principal on the loan in two years. (Calculations are not required.)

## COMPOUND INTEREST TABLES

Table 1: Future Value of 1:  $f_{n,i} = (1 + i)^n$

Table 2: Future Value of an Ordinary Annuity of 1:  $F_{0n,i} = \frac{(1+i)^n - 1}{i}$

Table 3: Present Value of 1:  $p_{n,i} = \frac{1}{(1 + i)^n}$

Table 4: Present Value of an Ordinary Annuity of 1:  $P_{0n,i} = \frac{1 - \frac{1}{(1+i)^n}}{i}$

Table 5: Present Value of Annuity Due:  $P_{dn,i} = \frac{1 - \frac{1}{(1+i)^{n-1}}}{i} + 1$

Table 1 FUTURE VALUE OF 1:  $f_{n,i} = (1 + i)^n$ 

$n$	1.5%	4.0%	4.5%	5.0%	5.5%	6.0%	7.0%

# Financial Reporting: Asset Valuation and Income Measurement

## CHAPTER 7

Cash and Receivables

## CHAPTER 8

Inventories: Cost Measurement and Flow Assumptions

## CHAPTER 9

Inventories: Special Valuation Issues

## CHAPTER 10

Property, Plant, and Equipment: Acquisition and Disposal

## CHAPTER 11

Depreciation and Depletion

## CHAPTER 12

Intangibles

## OBJECTIVES

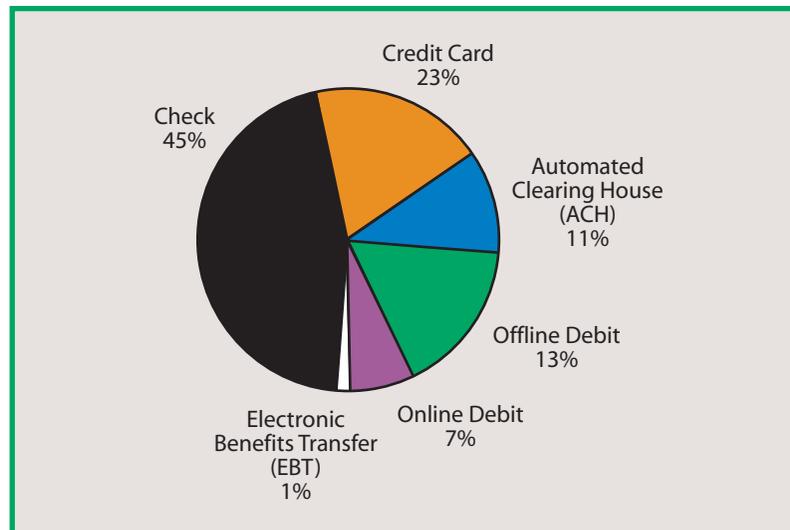

After reading this chapter, you will be able to:

- 1 Identify items of cash (and cash equivalents).
- 2 Understand the importance of cash management.
- 3 Discuss revenue recognition when the right of return exists.
- 4 Understand the credit policies and internal control related to accounts receivable.
- 5 Explain the gross and net methods to account for cash discounts.
- 6 Estimate and record bad debts using a percentage of sales.
- 7 Estimate and record bad debts using an aging analysis.
- 8 Explain pledging, assignment, and factoring of accounts receivable.
- 9 Account for short-term notes receivable.
- 10 Understand a petty cash fund (Appendix).
- 11 Prepare a bank reconciliation (Appendix).

## Cash and Receivables

### Show Me the Money!

Cash is the lifeblood for companies and infusions are coming more frequently from nontraditional sources. According to the 2004 Federal Reserve Payments Study, Americans are for the first time using electronic “money” such as debit and credit cards more frequently than checks to pay their bills.

Hastening the decline in the use of checks is a process known as accounts receivable conversion (ARC). In ARC, when paper checks arrive at a bank lockbox, they are converted into automated clearing house debits and the check itself is then

Credit: MICHAEL NAGLE/Bloomberg News/Landov

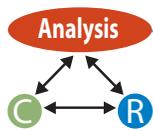

destroyed. For banks, the savings are obvious—ARC payments are about one-third cheaper than handling checks and float time (the time it takes for a check to clear the bank) is cut in half. Additionally, the Check Clearing for the 21st Century Act is a recently enacted law that gives legal status to substitute checks. Termed Check 21, this act allows merchants to scan checks and transmit the digital images to the bank instead of sending the actual check. Whether it is ARC or Check 21, one thing is clear—making payments will never be the same again.

### FOR FURTHER INVESTIGATION

For a discussion of ARC or Check 21, consult the Business & Company Resource Center (BCRC):

- Tear Out a Check, Then Watch it Vanish. Jeffrey Selinger, *The New York Times*, 0362-4331, October 9, 2003, pG6 col. 04.
- Why Check 21 Could Erase ARC's Gains. Will Wade, *American Banker*, 0002-7561, November 5, 2003, v168, i213, p1.

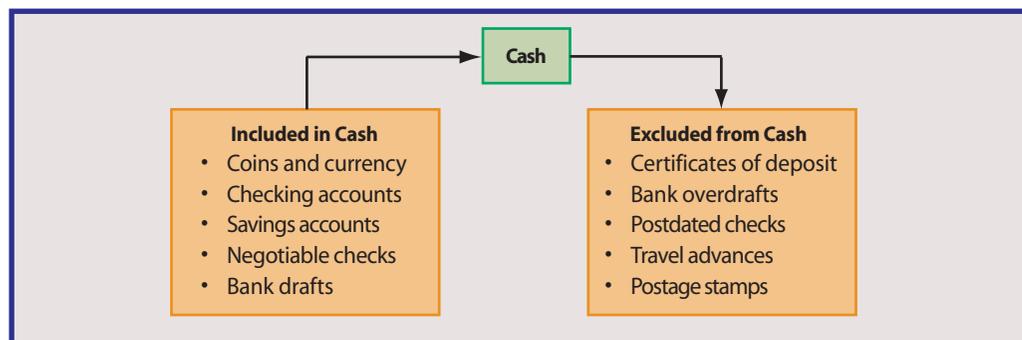

Financial statement users focus on a variety of information in making credit and investment decisions. Investors, long-term creditors, and short-term creditors are interested in a company's **financial flexibility**, the ability to use its financial resources to adapt to change. One part of a company's financial flexibility that external users are concerned about is liquidity. **Liquidity** is the availability of a company's liquid assets (cash or assets that may be quickly converted into cash) to pay its bills. The most common liquid assets are cash, temporary investments, accounts receivable, and notes receivable. In this chapter we discuss the measurement and valuation procedures for cash, accounts receivable, and notes receivable. Because the accounting principles for temporary investments are similar to those for most long-term investments, we do not discuss temporary investments until Chapter 15.

## CASH

Cash is the resource on hand to meet planned payments and emergency situations. **The amount a company reports as cash in the current assets section on its balance sheet must be available to pay current obligations.** There must not be any contractual restrictions that prevent the company from using this money to pay its current debts. For example, some companies create sinking funds into which they deposit cash over an extended period. At the end of the period, the cash (plus accumulated interest) is to be used for a specific purpose (e.g., to retire long-term bonds). Amounts in sinking funds are not classified as cash on the balance sheet; a company normally reports these amounts in the long-term investments category.

**Cash classified as a current asset includes coins, currency, unrestricted funds on deposit with a bank** (either checking accounts or savings accounts<sup>1</sup>), **negotiable checks, and bank drafts.** On the other hand, some items may be confused with cash but normally are listed under other balance sheet captions. Among these items are certificates of deposit, bank overdrafts, postdated checks, travel advances, and postage stamps. *Certificates of deposit (CDs)* are short-term investments issued by banks that allow a company to invest idle cash for short periods of time. CDs normally are classified as temporary investments. *Bank overdrafts* are overdrawn checking accounts. They are reported as current liabilities and should *not* be offset against positive balances in other bank accounts. *Postdated checks* from customers are checks dated in the future so they become payable on a date later than the issue date. Postdated checks are included as receivables until the date they become negotiable. *Travel advances* are funds or checks given to company employees to cover out-of-pocket expenses while traveling on company business. Since travel advances are satisfied when the employee submits receipts for business expenses, they are classified as prepaid items. *Postage stamps* on hand are classified as prepaid items because they will be used rather than exchanged for cash. Below is a diagram that summarizes what is, and what is not, included in cash.

1 Identify items of cash (and cash equivalents).

1. Although some banks place restrictions on the withdrawal of funds from savings accounts, they generally are included as a component of cash.

In summary, to be classified under the current asset—Cash—caption on a company's balance sheet, amounts must be available immediately to pay its bills and may not be bound by any contractual or legal restrictions. Items that do not meet these criteria are reported elsewhere within the assets (or liabilities) section on the balance sheet.

## Cash and Cash Equivalents

Some companies use the title Cash on their balance sheets. An increasing number (approximately 88%)<sup>2</sup>, however, use a title such as *Cash and Cash Equivalents*. In addition to cash, these companies include in this category items that are considered to be “cash equivalents” because of their liquidity and low risk. **Cash equivalents** are short-term, highly liquid investments that are readily convertible into known amounts of cash and so near their maturity that there is little risk of changes in value because of changes in interest rates. Generally, only investments with maturity dates of three months or less from the date acquired by the holder are cash equivalents.<sup>3</sup> Securities such as commercial paper, treasury bills, and money market funds are examples of cash equivalents. For instance, in its December 31, 2004 balance sheet, **Eastman Kodak Company** reported cash and cash equivalents as a current asset. Then it included a note describing its cash equivalents in the notes to its financial statements, as we show in Real Report 7-1.

### Real Report 7-1 Cash and Cash Equivalents

EASTMAN KODAK COMPANY AND SUBSIDIARY COMPANIES		
CONSOLIDATED STATEMENT OF FINANCIAL POSITION (in part)		
(in millions, except share and per share data)	At December 31	
	2004	2003
ASSETS		
Current Assets		
Cash and cash equivalents	\$1,255	\$1,250
NOTES TO FINANCIAL STATEMENTS		
<i>NOTE 1: Significant Accounting Policies (in part)</i>		
<b>Cash Equivalents</b> All highly liquid investments with a remaining maturity of three months or less at date of purchase are considered to be cash equivalents.		

### Questions:

1. Why does Eastman Kodak combine cash and cash equivalents into one amount on the balance sheet?

A clear understanding of what items a company includes in Cash and Cash Equivalents is important because when preparing its statement of cash flows, it must reconcile its cash inflows and outflows to the change in cash and cash equivalents. In this chapter for simplicity we focus our discussion on Cash.

## Cash Management

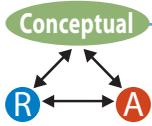

Efficient cash management is very important to every company. Each company must ensure that it has enough cash to pay its current obligations. However, it must recognize the fact that idle cash is a nonproductive resource.

- 2 Understand the importance of cash management.

2. *Accounting Trends and Techniques* (New York: AICPA, 2004), p. 150.

3. “Statements of Cash Flows,” *FASB Statement of Financial Accounting Standards No. 95* (Stamford, Conn.: FASB, 1987), par. 8.

Although a company may wish to protect itself against business failure by amassing a large amount of cash to keep itself liquid, it can improve its performance by investing these funds and earning interest. Proper cash management requires that a company invest its idle cash and estimate the timing of its cash inflows and outflows to ensure that it has enough cash to meet its needs. Having too much cash, however, may make a company the target of a takeover attempt.

Information on cash management is important in financial accounting because one objective of financial reporting is to communicate how well the managers of a company have fulfilled their stewardship responsibility to stockholders for the use of the company assets. In this regard, cash management includes planning and control aspects. **Cash planning** systems are those methods and procedures that a company uses to ensure that it has adequate cash available to meet maturing obligations and that it invests any unused or excess cash. **Cash control** systems are the methods and procedures a company uses to safeguard its funds.

A company's cash budget is the major component of its cash planning system. **The cash budget is a plan of cash activity that forecasts cash receipts and payments, and identifies when the company might have too much or too little cash.** The cash budget is primarily a managerial accounting technique and is outside the scope of this book.

Cash control systems require adequate internal control measures. **Internal control** is the process (policies and procedures) a company uses so that its financial reports are reliable, its operations (including safeguarding its assets) are effective and efficient, and that it complies with applicable laws and regulations.<sup>4</sup> This control is so important that a federal law requires all publicly traded companies to maintain adequate internal control systems. Since cash cannot be traced easily, internal control over cash is enhanced by routine reviews of the accuracy of recorded cash transactions and by the separation of employee duties. These procedures help to prevent theft unless there is collusion among employees. However, whenever a company adopts internal control measures, the cost of using these measures should not exceed the value of the benefits. Any measure that costs more than its benefits ultimately will result in lower profits for the company.

Cash control systems can be subdivided into two main functions: (1) control over receipts and (2) control over payments. The control procedures a company adopts for its cash receipts should be designed to safeguard all cash inflows from the time they arrive at the company until they are deposited in its bank account. The key elements in a cash receipts internal control system are

- immediate counting of receipts by the person opening the mail or the salesperson using the cash register,
- daily recording of all cash receipts in the accounting records, and
- daily deposit of all receipts in the company's bank account.

The control procedures for payments should ensure that only authorized payments are made for actual company expenditures. The key elements in a cash payments internal control system include

- making all payments by check so there is a record for every company expenditure,
- authorizing and signing checks only after an expenditure is approved, and
- periodically reconciling the cash balance in the bank statement with the company's accounting records.

Two important elements of the internal control over cash are a petty cash system and a bank reconciliation. We discuss each of these elements in more detail in the Appendix at the end of this chapter.

4. For auditing purposes, a company's internal control structure consists of its control environment, risk assessment procedures, control activities, information and communication system, and monitoring process. For more detail, see *AICPA Professional Standards* vol. 1 (New York: AICPA, 2004), sec. 319.

## Electronic-Based Payments

Many companies prepare and process hundreds or even thousands of checks each month to pay their suppliers and employees. Furthermore, they receive and process an equally large number of checks from their customers. Whether for payments or receipts, processing the paperwork for checks is expensive. With the increased use of computer networks, banks offer **electronic funds transfers (EFT)** to their customers. Under EFT, funds are transferred between companies electronically without the need of a check. EFT systems are becoming more compatible, and their networking capabilities are increasing. In addition to EFT systems, banks are also using accounts receivable conversion (ARC) and Check 21 (as we discussed at the opening of the chapter) for faster processing of “checks.” As more and more companies and banks use EFT, ARC, and Check 21 systems, fewer physical documents (e.g., checks) are processed. Therefore, greater emphasis is being placed on internal control systems as they apply to computer technology because fewer physical source documents are available to verify cash inflows and outflows.

## Compensating Balances

It is common for banks to require a portion of any amount loaned to a company to remain on deposit in the bank (usually earning a low interest rate) for the loan period. These required deposits are called **compensating balances** because they “compensate” the bank for granting the loan. For example, a bank loaning a company \$100,000 may require that the company maintain a \$10,000 deposit with the bank until the company repays the loan. Such arrangements have two main effects. First, they reduce the amount of cash available to the borrower, and second, they increase the effective interest rate the borrower pays for the use of the funds. For example, if the stated interest rate for the \$100,000 loan is 12%, the effective rate for the actual funds used for a year is 13.33% ( $\$12,000 \div \$90,000$ ), assuming the \$10,000 compensating balance does not earn any interest.

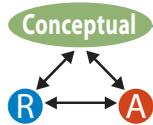

The SEC studied funds subject to these withdrawal or usage restrictions. This study was partially in response to *liquidity* problems that were reported by companies with apparently adequate cash balances. The SEC found many cases in which a portion of the reported cash balance was legally restricted. Therefore, it requires that a public company with a compensating balance against its short-term borrowings separately report the amount in the current assets section of its balance sheet. Compensating balances for long-term borrowings are separately reported as noncurrent assets (as either investments or other assets). Compensating balance agreements that do not legally restrict the amount of funds shown on the balance sheet are disclosed in the notes to the financial statements.

### SECURE YOUR KNOWLEDGE 7-1

- To be reported as cash, the resource must be readily available to pay current obligations and may not be bound by any contractual or legal restrictions.
- Cash equivalents are short-term, highly liquid investments with a maturity date of three months or less from the date of purchase; they are often combined with cash for financial reporting purposes.
- A well-functioning cash management system ensures that a company has enough cash to fulfill its needs, invests any idle cash, and safeguards its cash receipts and cash payments.
- Compensating balances required in connection with loans serve to increase the effective interest rate on the loan and must be adequately disclosed.

## RECEIVABLES

**Receivables** are amounts owed to the company by customers and other parties arising from the company's operations. Most receivables are canceled through the receipt of cash, although others may be canceled through the receipt of other assets or services. A company reports receivables on its balance sheet as either **current** or **noncurrent** items.

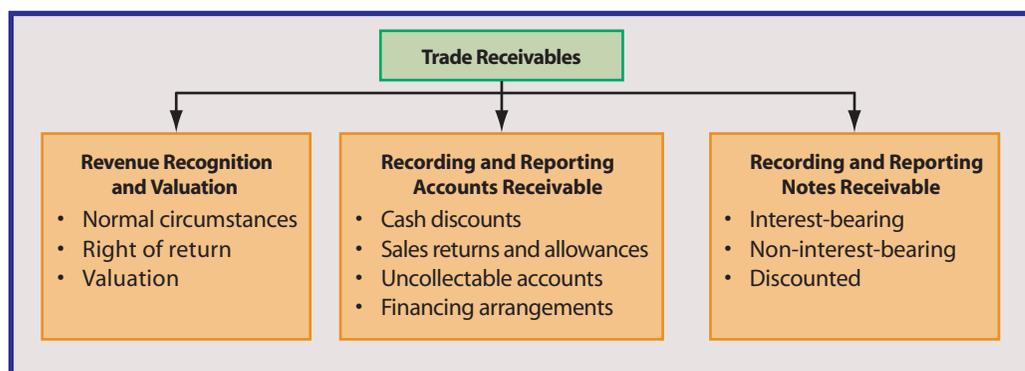

Those receivables expected to be collected within one year or the current operating cycle, whichever is longer, are classified as current assets; the remainder are classified as noncurrent. Also, a company may group receivables within its classified balance sheet as trade receivables and nontrade receivables.

**Trade receivables** arise from the sale of the company's products or services to customers. For instance, manufacturers may sell on credit to retailers (or other manufacturers), and retailers may sell on credit to consumers. Trade receivables generally are the majority of a company's total receivables balance. Trade receivables may be subclassified into **accounts receivable** (nonwritten promises by customers to pay for goods or services) and **notes receivable** (unconditional written agreements to receive a certain sum of money on a specific date). We discuss these subclassifications later in the chapter.

**Nontrade receivables** arise from transactions that are not directly related to the sale of the company's goods and services. Nontrade receivables are recorded in separate accounts. They are reported on the balance sheet in individual groups as current or noncurrent assets, depending upon the length of their collection period. Examples of nontrade receivables include deposits with utilities, advances to subsidiary companies, loans made by nonfinancial companies, deposits made to guarantee performance, and declared dividends and accrued interest on investments.

Utility companies often require a company to make a deposit to guarantee utility expense payments. This deposit normally is classified by the depositor as a noncurrent receivable because the timing of repayment by the utility company is indeterminate. An advance to a subsidiary typically is classified as long-term because repayment may be postponed indefinitely. A deposit made to guarantee contract performance is classified as either current or noncurrent, depending on the expected completion date of the project guaranteed. Declared dividends to be received and accrued interest on investments are disclosed as current assets. In this chapter we focus upon the valuation issues associated with current trade receivables. We discuss nontrade receivables and noncurrent receivables in other chapters in this book.

Accounting for trade receivables involves a number of issues. We include the following diagram to provide you with an overview of our related discussion.

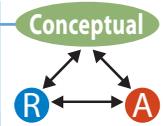

## REVENUE RECOGNITION AND VALUATION OF TRADE RECEIVABLES

First, we look at several issues related to revenue recognition and receivables valuation.

### Normal Revenue Recognition

A company usually makes sales of goods and services on “open accounts” that result in short-term extensions of credit. **A company records revenue from credit sales based on the revenue recognition criteria.** Revenue is recognized when **realization has occurred** (i.e., a noncash resource is exchanged for cash or a near cash resource) and the **revenue is earned** (i.e., the earning process is complete or virtually complete). Typically, the sale of goods and services on credit results in an asset called a trade receivable (account receivable or note receivable) and the recognition of revenue at the time of sale. This approach is used because the company expects to collect the asset (receivable), and very few activities remain in the earning process. However, in some cases a company may defer revenue recognition because it is not sure it will collect the receivable (which we will discuss in Chapter 18). In other cases, a company may defer revenue because a right of return exists.

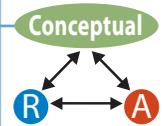

### Right of Return

In most industries sales returns and allowances are not material, so that companies typically record them at the time of the return or allowance even if they occur in a period later than the period of sale. In some industries, such as book publishing, the right of return is common and the amounts may be material. In these cases, credit “sales” in one period may be followed by substantial returns in another. These factors create a revenue recognition issue for the selling company because sometimes (1) it cannot make reliable estimates of the collectibility of the receivable and (2) the risks and benefits of ownership are not transferred (the earning process is not complete) to the buyer. As a result, **FASB Statement No. 48 identifies criteria for recording sales revenue when the right of return exists. For a seller to recognize revenue at the time of sale, each of the following criteria must be satisfied when the right of return exists.** If they are not, then the seller must defer revenue recognition.

**3** Discuss revenue recognition when the right of return exists.

1. The sales price is known at the date of sale.
2. The buyer has paid or will pay the seller, and the obligation is not contingent upon resale of the product.
3. The buyer’s obligation to the seller would not be changed by theft or damage to the product.
4. The buyer has an economic substance apart from the seller.
5. The seller does not have significant obligations to help the buyer sell the product.
6. The seller can reasonably estimate the amount of future returns.<sup>5</sup>

If a company defers recognizing sales revenue and cost of goods sold because one or more of these conditions are not met, it records the sales revenue and cost of goods sold either when the return privilege expires or when the conditions are met, whichever occurs first.

### Valuation Issues

When the conditions in the previous section are met so that the company records a receivable and revenue at the time of sale, there still is an issue of valuing the trade receivable. As we discussed in Chapter 4, one purpose of reporting current assets is to disclose the **liquidity** of a company; that is, the “nearness to cash” of its economic resources. In this regard, the accounting issues related to the valuation of current trade receivables are (1) the initial recording of the receivables based on the total future cash flows, and (2) the estimation of the probability of collection. Since there is a time value of money,

5. “Revenue Recognition When Right of Return Exists,” *FASB Statement of Financial Accounting Standards No. 48* (Stamford, Conn.: FASB, 1981), par. 6.

there is a difference between the maturity value of a receivable and its present value. The longer the time until maturity, the greater the difference. **APB Opinion No. 21** (discussed in Chapter 15) provides specific guidelines for recording and reporting receivables at their present values. However, the provisions do not apply to “receivables . . . arising from transactions with customers . . . in the normal course of business which are due in customary trade terms not exceeding approximately one year.”<sup>6</sup> Consequently **most trade receivables are recorded initially at their maturity values** and not at their present values. Also, since the collection period for most trade receivables is 60 days or less, the difference between their present value and maturity value is usually not material.

The uncertainty of collection also affects the value of trade receivables. Whenever a company extends credit, it may not collect a few receivables. The company should consider this issue in valuing its receivables on its balance sheet to report on their liquidity. We discuss the accounting procedures used to deal with the uncertainty of collecting receivables later in this chapter.

## ACCOUNTS RECEIVABLE

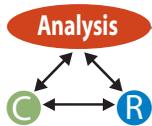

As we discussed earlier, trade accounts receivable result from credit sales. A company sells on credit in order to increase sales. But credit sales create the need for a credit department to investigate credit ratings, approve the extension of credit, and attempt to collect delinquent accounts. Credit sales result in a certain amount of bad debts due to nonpayment by customers. When a company considers whether or not to sell on credit, it must evaluate the trade-off between the additional gross profit received from the expected credit sales and the additional expenses incurred due to these credit sales. In this regard, most companies establish a credit policy.

A credit policy reflects the degree of risk a company is willing to accept to increase sales. Credit policies are closely associated with customers’ credit ratings. High credit ratings indicate low risk, whereas low credit ratings indicate high risk. A company should adopt a credit policy that results in the maximum increased profit consistent with maintaining customer satisfaction. That is, it should determine the combination of increased sales revenue and bad debt losses that results in the highest incremental profit and cash inflows. However, it should also consider other factors, such as the cost of additional sales and credit personnel to handle these increased sales. A few companies have decided that this trade-off is negative. These companies believe that they can lower costs and increase profits by selling exclusively for cash. Note that retail “credit card” sales involving bank credit cards are treated as cash sales, as we discuss later in the chapter.

If a company decides to sell on credit and establishes a credit department, it must install an effective internal control system for processing credit sales and cash collections. We discussed the internal control procedures used for cash collections earlier in the chapter, but a company must also establish internal control procedures for processing its accounts receivable. These control features include (1) prenumbered sales invoices so that all invoices are accounted for, and (2) the separation of the sales function from the cash collection responsibilities so that theft should not occur unless there is collusion between employees.

Once a company feels that a reasonable trade-off exists between the incremental revenues and expenses of credit sales, and has established an adequate system of internal control for credit sales, other issues may arise in recording accounts receivable. These issues include cash discounts and sales returns and allowances. We discuss uncollectible accounts (bad debts) in a later section.

**4** Understand the credit policies and internal control related to accounts receivable.

6. “Interest on Receivables and Payables,” *APB Opinion No. 21* (New York: AICPA, 1971), par. 3.

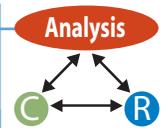

## Cash (Sales) Discounts

Companies may offer a discount to induce prompt payment. This discount is called a **cash discount** (or **sales discount**) and frequently is expressed as 2/10, n/30 or perhaps 2/10, n/EOM (end of month). In both cases **the first component refers to the discount rate and period, and the second to the invoice due date**. These terms are read in the first case as: A 2% discount may be subtracted from the invoice price<sup>7</sup> if payment is made by the purchaser within 10 days, and the total invoice price is due within 30 days. In the second example full payment is due by the end of the month. For example, assume that Company S sells \$5,000 of merchandise to Company B with terms of 2/10, n/30. If Company B pays for the merchandise within 10 days, it only has to pay \$4,900. This \$100 cash discount is a strong inducement to pay within the discount period because it is a relatively high effective annual interest rate for Company B. By paying within the discount period, Company B is giving up the use of funds for 20 days (that is, the invoice is due 20 days after the discount period expires) to earn a discount of 2%. This is approximately equal to an annual effective interest rate of 36% ( $0.023 \times 60/20$ ).

Cash discounts are important in the financial management of companies. Both sellers and purchasers should carefully analyze the potential effects of cash discounts. As we noted, the theory behind cash discounts is that they will induce prompt payment. A purchasing company should take advantage of any cash discounts that have a higher effective annual interest rate than the rate it must pay to borrow money. For a selling company, a cash discount has two main positive effects: (1) it stimulates faster collection of cash for use in current operations, and (2) it tends to reduce the losses resulting from uncollectible accounts. However, the seller should not overlook the negative effect of its reduced total cash inflow because of the discount. Sellers should attempt to set the cash discount rate at a level so that its positive effects exceed any negative effects.

If a selling company extends cash discounts to its customers, it may use one of two methods (a “gross” method or a “net” method) to account for the discounts:<sup>8</sup>

1. *Accounts Receivable and Sales Recorded at Gross Price.* When the selling company uses the gross price method, it records the total invoice price in both the Accounts Receivable and Sales accounts at the time of sale as if no cash discount were involved. When the customer pays and takes the allowable cash discount, the company records the difference between the cash received and the original amount of Accounts Receivable as a debit to Sales Discounts Taken. If the customer does not take the cash discount, it pays an amount that is equal to the original balance in the company’s Accounts Receivable account, and no further adjustment is needed. Sales discounts taken are deducted from sales on the income statement to determine net sales.
2. *Accounts Receivable and Sales Recorded at Net Price.* When the selling company uses the net price method, it records the net invoice price (after deducting the allowable cash discount) in both the Accounts Receivable and Sales accounts at the time of sale. When the customer pays and takes the allowable cash discount, no adjustment is needed because the amount of cash received is equal to the recorded amount of the receivable. However, if the customer does *not* take the cash discount, it pays an amount that is greater than the amount in the company’s Accounts Receivable

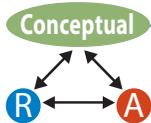

**5** Explain the gross and net methods to account for cash discounts.

7. Another type of discount is the **trade** (or *quantity*) discount, which is offered for purchases in excess of a certain quantity. For example, if a company offers a 10% trade discount and a customer purchases 100 units of an item with a list price of \$80 per unit subject to the trade discount, the customer is billed \$7,200 [ $\$8,000 - (0.10 \times \$8,000)$ ] as the invoice price. This \$7,200 invoice price then is subject to the cash discount.
8. In a third method, accounts receivable are recorded at the gross price, sales are recorded at the net price, and the difference is recorded in an allowance account (a contra account to accounts receivable). The allowance account then is reduced by the difference between the cash collected from the customer and the accounts receivable balance. It also is adjusted for sales discounts not taken.

account. The company credits this excess to an account entitled Sales Discounts Not Taken, which is interest revenue and is reported in the Other Items section of the income statement.<sup>9</sup>

To illustrate these methods, assume that the Howe Corporation sold \$8,000 of merchandise to various customers on December 4, 2007, with terms of 2/10, n/EOM. On December 13 Howe received payment on goods originally billed at \$5,500. Howe received payment on goods billed at \$1,500 on December 30. The remaining \$1,000 was not collected by the end of the year. Example 7-1 shows the journal entries to record these transactions and the year-end adjustments.

		Gross Price Method		Net Price Method	
To record sale on December 4, 2007	Accounts Receivable	8,000		Accounts Receivable	
	Sales		8,000	[\$8,000 - (0.02 × \$8,000)]	7,840
				Sales	7,840
To record payment received on December 13, 2007	Cash			Cash	5,390
	[\$5,500 - (\$5,500 × 0.02)]	5,390		Accounts Receivable	5,390
	Sales Discounts Taken	110			
	Accounts Receivable		5,500		
To record payment received on December 30, 2007	Cash	1,500		Cash	1,500
	Accounts Receivable		1,500	Accounts Receivable	
				[\$1,500 - (\$1,500 × 0.02)]	1,470
				Sales Discounts Not Taken	30
To adjust the accounts at the end of the period	No entry required			Accounts Receivable	20
				Sales Discounts Not Taken	20

**Conceptual Evaluation**

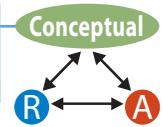

Theoretically the use of the net price method is sound because it values the accounts receivable at the net realizable value and also separates the amount of sales revenue from interest revenue. The gross price method has the advantage over the net price method of reporting receivable accounts at gross amounts, which simplifies communications with customers (because discussions are based on the gross amount). The gross price method also has the advantage of enabling sales returns and allowances (discussed later) to be recorded at gross instead of net amounts. But since a company expects most customers to take advantage of the cash discount, the gross price method overstates its current sales and accounts receivable at the end of the period. However, because the gross price method requires less record keeping, most companies use this method. Furthermore, when the timing of collections does not vary much from period to period, there is no material difference from using either method.

**Sales Returns and Allowances**

When a company sells merchandise, a few defective items may be returned by customers. In other cases contractual agreements also may allow products that are *not* defective to be returned. **When goods are sold that are found to be defective, the customer may retain**

9. At the end of the accounting period, an adjusting entry may be made for any cash discounts no longer available on the outstanding accounts receivable. This entry involves a debit to Accounts Receivable and a credit to Sales Discounts Not Taken. A reversing entry is usually made so that when these sales are collected, the collections may be recorded in the usual manner for when no discount is taken.

the goods and be allowed a reduction in the purchase price. This reduction is called a *sales allowance*. When the customer returns goods to the seller, the exchange is called a *sales return*. Often a sales return or allowance occurs in an accounting period after the sale. From a theoretical standpoint, if a company can make reliable estimates, it should record the estimated amount of future returns and allowances in the period of sale so as to correctly report net sales revenue and value ending accounts receivable.

To illustrate the accounting for sales returns and allowances, assume that the Barclay Corporation sells \$500,000 of goods during 2007 and the company estimates that returns and allowances will be 2% of sales. To anticipate the returns and allowances, the company records the following adjusting entry at the end of the period of sale (assuming it uses the gross price method of recording sales):

<b>Sales Returns and Allowances (\$500,000 × 0.02)</b>	<b>10,000</b>	
<b>Allowance for Sales Returns and Allowances</b>		<b>10,000</b>

Consequently, when sales returns and allowances of \$8,000 actually occur for goods sold on credit, the company records this transaction as follows:

<b>Allowance for Sales Returns and Allowances</b>	<b>8,000</b>	
<b>Accounts Receivable</b>		<b>8,000</b>

If the company used the net price method to record sales, it would base the preceding entries on the net price after deducting the cash discounts.

When a company estimates its sales returns and allowances in the period of sale, it includes any balance in the Allowance for Sales Returns and Allowances account on the balance sheet as a valuation account offset against Accounts Receivable. In cases where returns and allowances are not material, most companies do not estimate these items. Instead they record the returns and allowances on credit when they actually occur by debiting Sales Returns and Allowances and crediting Accounts Receivable (at the gross price or net price depending on which method they are using). Whether estimated or actual, a company reports sales returns and allowances on its income statement as a deduction from sales revenue.

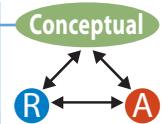

## VALUATION OF ACCOUNTS RECEIVABLE FOR UNCOLLECTIBLE ACCOUNTS

The preceding discussion focused on the issues involved in initially recording trade accounts receivable. Not all accounts receivable will be collected, however. Some will become bad debts. A company might record uncollectible accounts (bad debts) by either of two procedures:

1. In the year of sale, based upon an estimate of the amount of uncollectible accounts, or
2. When it determines that a specific customer account is uncollectible.

FASB Statement No. 5 requires that companies estimate their losses from loss contingencies and deduct the amounts from income and assets when both of the following conditions are met:

1. Information available prior to the issuance of the financial statements indicates that it is probable that an asset has been impaired at the date of the financial statements.
2. The amount of the loss can be reasonably estimated.<sup>10</sup>

10. "Accounting for Contingencies," *FASB Statement of Financial Accounting Standards No. 5* (Stamford, Conn.: FASB, 1975), par. 8.

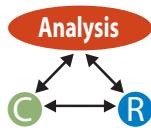

Since both conditions normally are met in regard to uncollectible accounts, most companies estimate bad debts. For instance, over 93% of surveyed companies reported estimates of bad debts on their financial statements.<sup>11</sup> This approach enables these companies to properly value their receivables and match expenses against revenues in the current period.

### Allowance Method

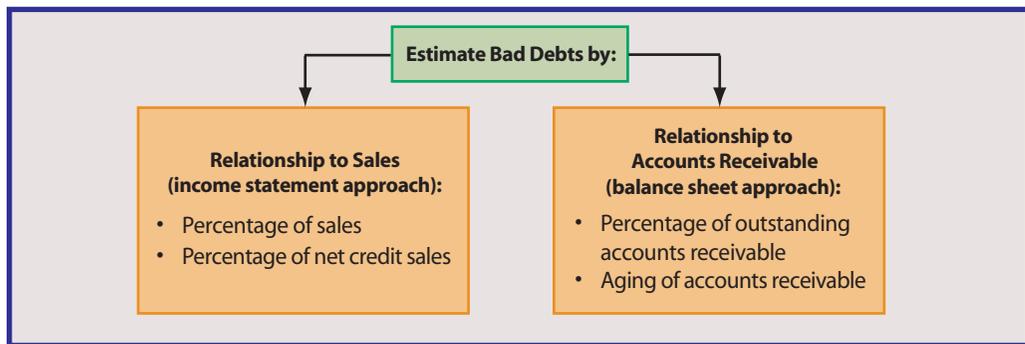

Under the **allowance method** a company studies the historical data about the actual bad debts it has incurred. It compares this information to its current sales or accounts receivable to determine relationships to use to estimate its current uncollectible accounts. **These relationships provide the information the company needs to prepare the adjusting entry to record the estimated bad debt expense for the period.**

When the company records the estimate of bad debts, the journal entry is a debit to Bad Debt Expense and a credit to Allowance for Doubtful Accounts (or, alternatively, Allowance for Bad Debts or Allowance for Uncollectible Accounts). A company normally reports bad debt expense on its income statement as an operating expense. However, some companies offset the account against gross sales, or report it as a financial expense in the Other Items section. The authors suggest reporting bad debt expense as an operating expense because it is similar to other operating expenses. Also, financial statement users normally expect companies to report bad debt expense in this manner.

Allowance for Doubtful Accounts is a valuation (contra) account that is offset against Accounts Receivable in the current assets section of the company's balance sheet. Although current credit sales create a likelihood of losses from bad debts, the company does not know at the time of sale which actual customer accounts will not be collected (if they were known, the company would not have extended credit to these customers). Offsetting Allowance for Doubtful Accounts against Accounts Receivable informs financial statement users of the net realizable value (the amount of cash expected to be collected) of the company's receivables.<sup>12</sup>

It is possible to base the estimate of bad debt expense on historical relationships between the actual bad debts incurred and (1) sales or (2) accounts receivable. These relationships may be classified as we show in the following diagram:

**6** Estimate and record bad debts using a percentage of sales.

### Percentage of Sales (or Net Credit Sales)

Estimating bad debts based on the historical relationship to sales matches current expenses against current revenues. This method is income statement oriented because it

11. *Accounting Trends and Techniques* (New York: AICPA, 2004), p. 177.

12. If a company has other accounts, such as Allowance for Sales Returns and Allowances, Allowance for Sales Discounts, and Deferred Gross Profit, it also deducts these accounts from Accounts Receivable to determine the net realizable value.

is based on the matching principle. It results in recording bad debt expense in the period during which credit sales occur. A percentage of total sales may be used for the estimate when there is a stable relationship between cash and credit sales. However, if the proportion of credit sales to total sales varies from period to period, it is not appropriate to use a percentage of total sales in any given period. For this reason most accountants favor estimating bad debts based on the historical relationship between bad debts and net *credit* sales. For example, if Lema Company's net credit sales during the year were \$525,000 and bad debts have historically amounted to 2% of net credit sales, the company makes the following year-end adjusting entry:

<b>Bad Debt Expense</b> ( $\$525,000 \times 0.02$ )	<b>10,500</b>	
<b>Allowance for Doubtful Accounts</b>		<b>10,500</b>

Since this method focuses on an expense account, any existing balance in the allowance account is ignored when determining the amount of the adjusting entry. Also, if a company sells many products in different locations, it may choose to estimate bad debts based on the historical credit sales of particular products or in specific locations. Although basing bad debt expense on sales is a relatively straightforward income statement approach and adheres to the matching concept, it may not provide the best estimate of the net realizable value of accounts receivable. This is because the balance in the allowance account is ignored when making the adjusting entry. Also, if the company materially over (or under) estimates the net realizable value of the accounts receivable, a change in the accounting estimate may be necessary. Furthermore, it provides only limited information for the credit department to use in its collection activities. Because of these disadvantages a company may use a balance sheet approach.

## LINK TO ETHICAL DILEMMA

As the accountant for SaveMart, the nation's largest retail company, you have performed an extensive analysis and estimated bad debts to be 3% of credit sales. While this estimate is slightly higher than last year's estimate of 2%, you feel the increase is warranted since the company, in an effort to stimulate sales, significantly relaxed its credit policy in the current fiscal year. However, if the 3% estimate is used, SaveMart's earnings will fall slightly below analysts' estimates. If the bad debt estimate is lowered to 2.5%, SaveMart will meet earnings expectations, and you will receive a large bonus. Because bad debt estimates have historically been between 2% and 3%, you are quite certain that the auditors will accept any estimate in this range. What are your responsibilities?

### Percentage of Outstanding Accounts Receivable

Bad debts may be estimated based on the historical relationship between actual amounts not collected and accounts receivable. This approach is balance sheet oriented because the resulting accounts receivable is reported on the balance sheet at its estimated net realizable value. A relatively simple balance sheet approach is to base the estimated expense on the historical relationship between the actual bad debts and the outstanding accounts receivable balance at the end of the year.

**In using this method, the goal is to determine the ending balance in Allowance for Doubtful Accounts.** To determine the amount of its adjusting entry, a company must

consider the existing balance (prior to adjustment) in the allowance account. The company records Bad Debt Expense at the amount necessary to adjust the existing allowance account balance to the required ending balance. For example, assume that Weir Company has determined that historically there has been a 4% relationship between actual bad debts and the year-end accounts receivable balance. The company's accounts at the end of the year (prior to adjustment) are as follows:

Accounts Receivable	475,000
Allowance for Doubtful Accounts	4,500 (credit balance)

The expected net realizable value of Accounts Receivable is \$456,000 [ $\$475,000 - (\$475,000 \times 0.04)$ ], and the required balance in Allowance for Doubtful Accounts is therefore \$19,000 ( $\$475,000 - \$456,000$ , or simply  $\$475,000 \times 0.04$ ). However, since the current credit balance in the allowance account is \$4,500, only the amount necessary to increase the allowance account to its required ending balance is recorded as Bad Debt Expense. In this example the amount is \$14,500 ( $\$19,000 - \$4,500$ ), as we show in the following T-account:

<u>Allowance for Doubtful Accounts</u>	
	4,500 (current balance)
	14,500 (required adjustment)
	19,000 (required ending balance)

Based on the preceding information, Weir Company records the following year-end adjusting entry:

Bad Debt Expense	14,500	
Allowance for Doubtful Accounts		14,500

A potential weakness of basing bad debts on a percentage of total outstanding accounts receivable is that it does not consider the due date of the many individual accounts comprising the total balance. This weakness is overcome by "aging" the accounts receivable.

### Aging of Accounts Receivable

#### 7 Estimate and record bad debts using an aging analysis.

The length of time an account is outstanding is important in estimating the probability of its future collection. A company is much more likely to collect an account that is 20 days old than one that is 360 days old. For this reason a more sophisticated method of estimating bad debts as a percentage of accounts receivable is used. A company that "ages" its accounts receivable first classifies the individual accounts based on the length of time they have been outstanding, and then applies an historically developed bad debts percentage to each age category. This information is available from the company's accounts receivable subsidiary ledger. The information in Example 7-2 is taken from the accounts receivable subsidiary ledger of the Rhorke Corporation and illustrates how bad debts are estimated with the use of an *aging schedule* (or aging analysis).<sup>13</sup>

In developing the aging schedule, the company reviewed the unpaid invoices in each customer's account, classified the invoice amounts according to the length of time the invoice has been outstanding, and totaled the amounts in each group. It then multiplied the total amount in each age group by the applicable estimated uncollectible percentage to determine the estimated amount uncollectible for that age group. It determines the

13. A company with few accounts receivable would probably not find an aging analysis to be a useful procedure, because each customer could be evaluated individually. Aging is appropriate when there are large numbers of customers who cannot reasonably be evaluated individually at the end of the period. In this example, for simplicity, only a few customers are used.

**EXAMPLE 7-2** Aging Analysis

**Rhorke Corporation**  
December 31, 2007

**(a) Aging Schedule of Accounts Receivable**

Customer	Length of Time Outstanding					
	Balance 12/31/07	Under 60 Days	60–120 Days	121–240 Days	241–360 Days	Over 1 Year
Goodwin Co.	\$ 33,100	\$21,000	\$12,100			
Hobson Inc.	14,500					\$14,500
Lomas Manufacturing	20,600	15,000	5,600			
McClendon Co.	15,700				\$15,700	
Schauer Corporation	37,900	17,500	16,800	\$3,600		
	<u>\$121,800</u>	<u>\$53,500</u>	<u>\$34,500</u>	<u>\$3,600</u>	<u>\$15,700</u>	<u>\$14,500</u>

**(b) Estimated Uncollectibles**

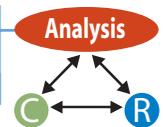

Age	Amount	×	Estimated Percentage Uncollectible	=	Estimated Amounts Uncollectible
Under 60 days	\$ 53,500		2%		\$ 1,070
60–120 days	34,500		8		2,760
121–240 days	3,600		15		540
241–360 days	15,700		30		4,710
Over 1 year	14,500		50		7,250
	<u>\$121,800</u>				<u>\$16,330</u>

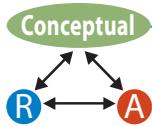

total estimated uncollectible amount by adding the estimated uncollectible amounts related to each age group.

This analysis indicates that the ending balance of Allowance for Doubtful Accounts should be \$16,330 on December 31, 2007. Since the objective in an aging analysis is to determine the ending allowance account balance, a company also considers the previous balance of the allowance account in recording the amount of bad debt expense at the end of the period. If Rhorke has a current \$1,350 *debit* balance in its allowance account, the amount of recorded expense necessary to bring the allowance account up to its required balance is \$17,680 (\$16,330 + \$1,350). Note that in this case the current *debit* balance in its allowance account is added. (We discuss the events that might cause the allowance account to have a debit balance in the next section.) A credit balance would be *subtracted* to determine the necessary adjustment amount. Based upon the preceding calculations, Rhorke makes the following year-end adjusting entry:

<b>Bad Debt Expense</b>	<b>17,680</b>	
<b>Allowance for Doubtful Accounts</b>		<b>17,680</b>

Use of the aging method, particularly when the company prepares interim (monthly) financial reports, is very helpful to its credit department. As it prepares each new aging schedule, this method focuses attention on any accounts that have not been collected and that have shifted to an older age category. Frequently, a company will compute its “receivables turnover” (net credit sales ÷ average net accounts receivable) along with its aging schedule, to determine how efficient it is in collecting its accounts receivable. The aging method has the advantage of properly reporting the net realizable value of accounts receivable on the balance sheet and of providing useful information to the credit department. However, it may not precisely match bad debt expense against revenue in the year of sale.

### Conceptual Evaluation

In summary, a company should estimate and record bad debt expense in the period of sale rather than record bad debts as accounts are written off. There are two main approaches to estimating bad debts. **The income statement approach, in which a percentage of sales (or net credit sales) is used, results in a matching of expenses with sales in the current period.** However, this approach may not report accounts receivable at their net realizable value, because it does not consider the age of the individual accounts. **The balance sheet approach, which uses a percentage of outstanding accounts receivable or an aging analysis for estimating bad debts, results in reporting accounts receivable at their expected net realizable value on the balance sheet.** Also, the aging analysis provides useful credit information. With the FASB's concern for reporting on a company's *liquidity* and *future expected cash flows*, the balance sheet method may be more appropriate. Currently, both methods are used in practice, and both are allowed under generally accepted accounting principles.

## LINK TO RATIO ANALYSIS

Cash is the lifeblood for any company and often results from billing and collecting credit sales. Therefore, many managers and investors carefully monitor accounts receivable to gain insight into future profitability and cash flow. The receivables turnover ratio (net credit sales ÷ average net receivables) is one measure often used as an indicator of the efficiency with which a company collects its receivables and converts them back to cash. Using data obtained from the **Walt Disney Company's** annual report, the receivables turnover computation is shown in the following table:

(amounts in millions)	2004	2003	2002
Receivables (net)	\$ 4,558	\$ 4,238	\$4,049
Net Revenues	\$30,752	\$27,061	

$$2004: \text{Receivables Turnover} = \frac{\$30,752}{\left( \frac{\$4,558 + \$4,238}{2} \right)} = 6.99$$

$$2003: \text{Receivables Turnover} = \frac{\$27,061}{\left( \frac{\$4,238 + \$4,049}{2} \right)} = 6.53$$

Disney turned its receivables over 6.99 and 6.53 times per year for fiscal years 2004 and 2003, respectively. Dividing the turnover ratio into 365 days, it appears that it took Disney, on average, 52.2 days and 55.9 days to collect its accounts receivables in 2004 and 2003, respectively. Overall, it appears that over the two-year period examined, Disney was successful at speeding up the collections of receivables and, as a result, had fewer resources tied up in receivables.

### Writing Off Uncollectible Accounts

If a company records bad debt expense based on an estimate, it writes off an individual account when it determines that the account is uncollectible. The journal entry is a debit

to Allowance for Doubtful Accounts and a credit to Accounts Receivable. This write-off is simply an adjustment required because the company has confirmed a previously estimated expense. The write off does not affect the carrying value of the accounts receivable on the balance sheet. Consider the following information for Shy Company:

Accounts Receivable	\$175,000
Allowance for Doubtful Accounts	8,750 (credit balance)
Customer account determined to be uncollectible	1,000

At the time of the write-off, the company makes the following journal entry:

Allowance for Doubtful Accounts	1,000	
Accounts Receivable		1,000

This write-off has *no effect* on the net realizable value of the accounts receivable because the allowance account and the accounts receivable balance are reduced by the same amount. As shown in the following schedule, before the write-off the net realizable accounts receivable was \$166,250 (\$175,000 – \$8,750). After the write-off the net carrying value of the accounts receivable is still \$166,250, but it now consists of a \$174,000 accounts receivable balance and a \$7,750 allowance account balance. Similarly, there is no affect on the income statement as a result of this write-off because it did not involve a revenue or expense account.

	Before Write-off	Write-off	After Write-off
Accounts receivable	\$175,000	\$(1,000)	\$174,000
Less: Allowance for doubtful accounts	<u>(8,750)</u>	1,000	<u>(7,750)</u>
Net realizable value	\$166,250		\$166,250

A company records its write-offs of accounts receivable when it determines the individual accounts that are uncollectible. Occasionally write-offs occur during the period of sale *prior to* recording the estimated bad debts at the end of the period. In these cases the journal entry for the write-off is the same as shown previously: a debit to Allowance for Doubtful Accounts and a credit to Accounts Receivable. This entry may cause a *debit* balance in Allowance for Doubtful Accounts prior to the year-end adjustment. When the company is using a balance sheet approach, the debit balance is considered in determining the amount of the adjusting entry. When the income statement approach is used, a debit (or credit) balance is ignored (unless it becomes significant). Additionally, estimates always involve future uncertainties, and the actual losses incurred from bad debts may be greater than the amount of estimated expense. As new information becomes available, a company may need to change its estimated percentage of bad debts. If the company uses the balance sheet approach, it modifies the balance of the allowance account each year based on the most current information. When a company changes the estimated percentage of bad debts, it treats this change as an adjustment of bad debt expense in current and future periods. This change is considered to be a change in estimate as defined by *FASB Statement No. 154*. We discuss changes in estimates in Chapter 23.

### Collection of an Account Previously Written Off

Occasionally a company will receive payment from a customer whose account it has already written off. Most accountants favor reestablishing the customer's account receivable in the subsidiary ledger and then recording the payment. This procedure has the advantage of providing a complete credit history for each customer account and also eliminates the previous write-off entry. For example, if Uphoff Company receives a \$300

payment from a customer whose account it had previously written off, the company makes the following journal entries:

<b>Accounts Receivable</b>	<b>300</b>	
<b>Allowance for Doubtful Accounts</b>		<b>300</b>
<b>Cash</b>	<b>300</b>	
<b>Accounts Receivable</b>		<b>300</b>

Note that the first entry “reverses” the initial write-off and the second entry records the cash collection in the usual manner. Also note that both entries to accounts receivable are also recorded in the customer’s account in the subsidiary ledger.

### Direct Write-Off Method

The second method of recording uncollectible accounts is called the direct write-off method. This method has the advantages of simplicity and of reporting actual bad debts expense rather than an estimate. **When a company uses the direct write-off method, it records bad debt expense when it determines that a specific customer account is uncollectible.** At that time it writes off the account by debiting Bad Debt Expense and crediting Accounts Receivable. However, this determination and write-off may not occur until a later period than the period of sale. The use of the direct write-off method has the disadvantage of matching the bad debt expenses associated with previous sales against revenues of the current period. It also overstates accounts receivable associated with previous sales. Furthermore, it allows the manipulation of income because management selects the period of write-off (and expense). For these reasons the direct write-off method is not allowed under generally accepted accounting principles. However, some companies use it for financial reporting because they are required to use it for income tax purposes and the results do not differ materially from those obtained under the estimated methods we discussed earlier.

### SECURE YOUR KNOWLEDGE 7-2

- Revenue from credit sales is normally recognized at the time of sale; however, if collectibility of the receivable is not reasonably assured or if a right of return exists, revenue recognition may be deferred until a later period.
- Accounts receivable are normally reported at the amount the company expects to receive (net realizable value).
- Cash discounts taken are recorded as a reduction of net sales; however, cash discounts *not* taken are left in sales (gross method) or recorded as interest revenue (net method).
- If sales returns and allowances can be reliably estimated, they should be recorded as a reduction in net sales and net receivables in the period of the sale.
- Because bad debt expense is a cost of granting credit, the matching principle requires that this expense be estimated and recorded in the period of the credit sale.
- Bad debt expense may be estimated as a percentage of sales (an income statement approach) or through an analysis of accounts receivable (a balance sheet approach).
- The write off of an uncollectible account under the allowance bad debt method does not affect the carrying value of net accounts receivable.

## GENERATING IMMEDIATE CASH FROM ACCOUNTS RECEIVABLE

The net realizable value of the accounts receivable reported on a company’s balance sheet is usually the amount of cash the company expects to collect in its normal operating

cycle. However, in some circumstances a company may find that it needs to accelerate the cash inflows from its accounts receivable.

In today's business environment there are many companies that specialize in "financing" other companies' accounts receivable. These finance companies include, for instance, **General Motors Acceptance Corporation (GMAC)**, **Ford Motor Credit Company (Ford Credit)**, and **General Electric Capital Services (GECS)**, as well as credit card companies such as VISA, MasterCard, American Express, and Diner's Club. There are many variations in financing arrangements, including which receivables are involved, which company collects the receivables, who has title, and who incurs bad debts.

In this section we discuss the accounting issues faced by a company that "transfers" its accounts receivable to a financing company in exchange for cash. For financial reporting, these issues involve revenue recognition and asset valuation. For **revenue recognition**, the issue relates to whether the risks of ownership of the receivables have been transferred (so revenue should be recognized). For **asset valuation**, the issue relates to who has control over the future benefits from the receivables (to determine who "owns" the asset). In addition, reporting on these types of arrangements provides important information about a company's **liquidity**, the nearness to cash of its receivables; and **financial flexibility**, its ability to use its receivables to adapt to changing financial conditions.

There are three basic forms of financing agreements to obtain cash from accounts receivable: (1) **pledging**, (2) **assigning**, and (3) **factoring (sale)**. There may be variations in the conditions of each agreement so that the distinctions are not always clear-cut.<sup>14</sup> These agreements are evaluated on a "continuum," based on the transfer of risks of ownership and control over the benefits of the receivables, as we show in Exhibit 7-1.

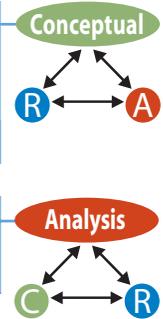

EXHIBIT 7-1 Accounts Receivable Financing Agreements		
Retain Risks and Benefits of Ownership	Transfer Some Risks and Benefits of Ownership	Transfer Risks and Benefits of Ownership
<b>Pledge</b>	<b>Assign</b>	<b>Factor</b>
<b>(Collateral for Loan)</b>	<b>(Specific Receivables with Recourse)</b>	<b>(Sale without Recourse)</b>

The FASB addressed these issues in **FASB Statement No. 140** related to financing agreements. It concluded that a company (transferor) records the transfer of financial assets (e.g., accounts receivable) in which it surrenders control over the financial assets to another company (the transferee) as a sale when *all* the following conditions are met:

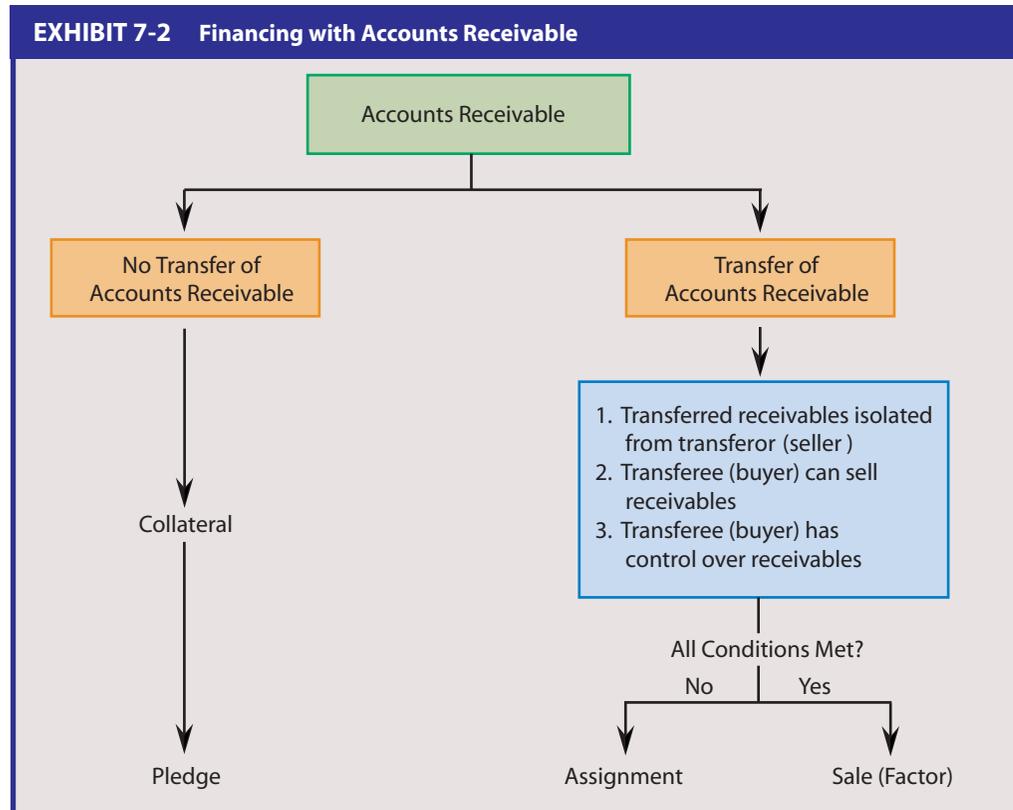

1. The transferred assets have been isolated from the transferor (i.e., put beyond the reach of the transferor).
2. The transferee obtains the right to exchange (e.g., sell) the transferred assets.
3. The transferor does not maintain effective control over the transferred assets through an agreement in which it can repurchase the transferred assets before their maturity.

If financial assets are transferred, the transferor continues to report on its balance sheet any retained interest in the transferred assets. If the transfer meets the conditions for a sale, the transferor records the proceeds, eliminates the financial assets, and records a

14. For a broad discussion, see "Asset Securitization: Economic Effects and Accounting Issues," *Accounting Horizons* (March 1992), pp. 5-16.

gain or loss. If the conditions for a sale are *not* met, the transferor records the proceeds from the transfer of financial assets as a secured borrowing.<sup>15</sup>

Of 600 surveyed companies nearly 26% reported pledging, assigning, or factoring their accounts receivable.<sup>16</sup> Exhibit 7-2 briefly shows how to determine whether to account for an accounts receivable financing agreement as a pledge, assignment, or factor (sale). We discuss the specific accounting for these three arrangements in the following sections.

## Pledging of Accounts Receivable

**8** Explain pledging, assignment, and factoring of accounts receivable.

When a company *pledges* its accounts receivable, it is using these accounts only as collateral for a loan, and the servicing activities remain its responsibility. (*Servicing activities* are the routine collection and administration functions.) The company records the loan as a liability in the usual manner. Then when it collects the receivable, it uses the cash to repay the loan plus any interest charges. Upon full payment of the loan the pledge is canceled. If the company defaults, the lender has the legal right to take title to the pledged receivables and sell them to recover the amount of the loan. Pledge agreements usually are not formally entered in a company's accounting records because there is no transfer of risk, and the company retains control over the receivables. A company generally discloses these agreements parenthetically or in the notes to its financial statements to indicate that a portion of the accounts receivable balance may not be available to general creditors.

15. "Accounting for Transfers and Servicing of Financial Assets and Extinguishment of Liabilities," *FASB Statement of Financial Accounting Standards No. 140* (Norwalk, Conn.: FASB, 2000), par. 9–12.

16. *Accounting Trends and Techniques* (New York: AICPA, 2004), p. 173.

### Assignment of Accounts Receivable

When a company *assigns* its accounts receivable to a financial institution, it enters into a lending agreement with the institution to receive cash on specific customer accounts. Frequently, these are long-term agreements. Assignment agreements can be very complex and involve issues such as interest rate swaps, call options, and unique servicing charges, as addressed in *FASB Statement No. 140*. Here, we discuss basic assignment agreements. Under a basic assignment agreement, the borrowing company (assignor) usually retains ownership of the assigned accounts, incurs any bad debts, collects the amounts due from customers, and uses these funds to repay the loan. Occasionally, the financial institution (assignee) will require the assigned accounts to make their payments directly to it (this procedure is called *notification*). The assignee may impose collection guidelines on the assigned accounts or may agree to share in the risks of nonpayment. In these cases some of the risks and control of ownership are transferred to the assignee. This is the major difference between assigning and pledging accounts receivable. Since the assignor (borrowing company) usually retains the risks of ownership, accounts are assigned *with recourse*. This means that if the cash collected from the accounts is not enough to repay the amount owed by the assignor, the assignee still can demand payment from (has recourse against) the assignor. This is the major difference between assignment agreements and factoring agreements, where the receivables are sold without recourse and the buyer assumes all the risks of ownership.

In assignment agreements the assignor company's relationship with the purchasers of its goods and services is not disrupted because the purchaser usually makes payments directly to the company (*non-notification*) and is unaware of the financing arrangement. Usually, the amount of receivables assigned is greater than the amount of the advance; the excess amount protects the assignee from sales returns and allowances. Under assignment arrangements the assignor pays a service charge and interest on the loan, and makes periodic payments (including interest) to the assignee based on collections of assigned accounts receivable. The assignor is also required to absorb any reductions due to sales returns and allowances or losses from uncollectible accounts. On the assignor company's balance sheet, it reports assigned accounts receivable separately from unassigned accounts receivable because it must use cash receipts from these assigned receivables for a specific purpose. That is, some of the benefits of ownership of the asset are transferred to the assignee. The assignor company reports the note payable as a current or noncurrent liability, depending on the due date.

#### Example: Assignment

Assume that on December 1, 2007, the Trussel Company assigns \$60,000 of its accounts receivable to a finance company. The finance company advances 80% of the accounts receivable assigned less a service charge of \$500. It also charges an annual interest rate of 12% on any outstanding loan balance. The journal entries that Trussel makes to record this assignment are:

Cash $[(\$60,000 \times 0.80) - \$500]$	47,500	
Assignment Service Charge Expense	500	
Note Payable $(\$60,000 \times 0.80)$		48,000
Accounts Receivable Assigned	60,000	
Accounts Receivable		60,000

The first journal entry records the receipt of cash. The Assignment Service Charge Expense account is a cost of borrowed funds and most companies usually record it as an expense at the time of the advance. The second journal entry reclassifies the receivables as assigned accounts receivable.

On December 31, 2007, Trussel collects \$10,000 on assigned accounts. It pays this amount along with the 12% interest for 1 month to the finance company. Trussel records these transactions as follows:

Cash	10,000	
Accounts Receivable Assigned		10,000
Note Payable	10,000	
Interest Expense ( $\$48,000 \times 0.12 \times 1/12$ )	480	
Cash		10,480

The interest expense on any future payments is based upon the balance *remaining* in the Note Payable account (for example, the interest expense for the next payment in our example is based on the \$38,000 note payable balance). During the period the note is outstanding, Trussel credits any bad debt losses and sales returns and allowances related to the assigned accounts receivable against the Accounts Receivable Assigned account. After Trussel pays the note, it reclassifies any remaining balance in Accounts Receivable Assigned as Accounts Receivable.

On the December 31, 2007 balance sheet of the Trussel Company, it reports the assigned accounts and the remaining liability (assuming it is short-term) as follows:

Current Assets		Current Liabilities	
Accounts receivable assigned	\$50,000	Note payable	\$38,000

Trussel includes a description of the financing agreement in the notes to its financial statements. ♦

## Factoring (Sale) of Accounts Receivable

When a company factors its accounts receivable, it sells individual accounts to a financial institution (called a factor). Since the company *sells* the receivables, it transfers title to the factor who assumes all the risks of ownership. That is, the company sells the accounts receivable *without recourse*, which means that if any receivables are not collected the factor cannot demand payment from it. Consequently, factoring agreements focus on control of the receivables and usually require (1) notification of the credit customers to remit the amounts owed directly to the factor, and (2) assumption by the factor of all collection activities, setting of credit policies, and losses from uncollectible accounts.

At the time of sale the factor (finance company) charges the selling company a commission. The commission usually is based on the amount of receivables transferred and is relatively high, although it varies depending on the risk of noncollection. The way in which the selling company records the commission depends on its normal operating activities. A selling company records the commission as an *expense* if it normally factors its accounts receivable, or as a *loss* if it usually does not sell its accounts receivable. In addition to charging a commission, the factor usually will pay only 80% to 90% of the value of the accounts receivable transferred, as a protection against sales returns and allowances. The selling company records the amount withheld (i.e., the 20% to 10%) in a separate Receivable from Factor account to indicate the amount that may be returned by the factor. Since title is transferred, the selling company reduces (credits) Accounts Receivable for the amount of the receivables sold.

### Example: Factoring

Assume that the Farber Corporation sells \$80,000 of accounts receivable to a factor, receives 90% of the value of the factored accounts, and is charged a 15% commission

based on the gross amount of factored accounts receivable. Farber records the following journal entry (assuming that it normally factors its accounts receivable):

Cash $[(\$80,000 \times 0.90) - \$12,000]$	60,000	
Receivable from Factor $(\$80,000 \times 0.10)$	8,000	
Factoring Expense $(\$80,000 \times 0.15)$	12,000	
Accounts Receivable		80,000

If sales returns or allowances occur on factored accounts, the selling company debits Sales Returns and Allowances and credits Receivable from Factor. At the conclusion of the factoring agreement for a particular group of receivables, the selling company collects any balance remaining in the Receivable from Factor account from the factor and debits Cash and credits Receivable from Factor. When a factoring agreement exists, the selling company discloses the agreement in a note to its financial statements. Factoring agreements are common in the furniture and textile industries; another common example is the sale of home mortgages from one financial institution to another. However, many companies are reluctant to use factoring agreements because of the cost of notifying their customers, and because their customers may dislike being required to make payments to a bank or finance company rather than to the seller. ♦

**Credit Card Sales**

Many retail companies make agreements with national credit card companies, which operate either independently or in affiliation with banks. Among the most popular are VISA, MasterCard, American Express, and Diner’s Club. Under these arrangements, card holders establish a **line of credit** (with the credit card company) which may be used for retail purchases of goods and services. After customers make credit purchases, the retailer deposits the credit card receipts in its bank account (or receives an electronic transfer of cash from the credit card company). The customers then repay the bank or credit card company. These types of agreements are *factoring* agreements.

The retailer accepting these credit cards charges its customers the selling price for goods and services, but is assessed a service charge on credit card sales by the bank or credit card company. This charge is usually a percentage of each sale, and the fee is for the use of a credit and collection department. Thus, the retailer usually records the fee as an operating expense. The individual retailer assumes little or no risk in accepting national credit cards, because most risk is borne by the bank or credit card company (except where there is fraud or negligence by the retailer) since the bank or credit card company originally granted the line of credit. The service charge assessed on credit card sales usually varies between 1 and 5% and is partially determined by the annual amount of sales or by exclusive arrangements. In an **exclusive arrangement** a retailer will accept only one national credit card, and in return the credit card company charges the retailer a lower service charge. For example, **Sam’s Club** accepts only Discover cards in its stores.

For example, assume that Kerns Shoes sold \$1,500 of merchandise on credit which was billed to a national credit card company. If the collection fee charged by the credit card company is 5%, Kerns makes the following journal entry when it deposits the credit card sales receipts (assuming it is using the gross price method of recording sales):

Cash	1,425	
Credit Card Expense $(\$1,500 \times 0.05)$	75	
Sales		1,500

Some large retailers (e.g., Sears, JCPenney) have their own credit cards. When a customer makes a credit purchase using a retail company’s credit card, the company records accounts receivable in the usual manner.

## Disclosure of Financing Agreements of Accounts Receivable

As we noted in the previous discussion, a company should disclose the existence of pledge, assignment, or factor (sale) agreements parenthetically or in the notes to its financial statements. An example of this type of disclosure for a factoring agreement is shown in the first note of UNIFI, Inc., 2004 financial statements in Real Report 7-2.

### Real Report 7-2 Disclosure of Factoring Agreement

UNIFI, INC.

NOTES TO CONSOLIDATED FINANCIAL STATEMENTS (IN PART)

1. Accounting Policies and Financial Statement Information (in part)

*Receivables:* . . . Prior to March 28, 2004, certain customer accounts receivable were factored without recourse. Effective March 26, 2004, the Company ended its factoring relationships due to the cost savings derived from in-house collections. The remaining factored receivables at June 27, 2004 were \$0.8 million compared to \$20.1 million at June 29, 2003. An allowance for losses is provided for known and potential losses arising from yarn quality claims and for amounts owed by customers that are not factored. . . . The reserve for such losses was \$10.7 million at June 27, 2004 and \$12.3 million at June 29, 2003.

#### Questions:

1. Why didn't UNIFI provide an allowance for losses on the accounts receivable that it factored?
2. Why did UNIFI end its factoring relationships?

## NOTES RECEIVABLE

A note receivable is an unconditional written agreement to collect a certain sum of money on a specific date. Notes receivable generally have two attributes that accounts receivable do not have:

1. They are negotiable instruments, which means that they are legally transferable among parties and may be used to satisfy debts by the holders of these instruments.
2. They usually involve interest, requiring the separation of the receivable into its principal and interest components.

Companies frequently require their customers to issue notes receivable when the customers wish to extend the repayment period on an account receivable. Sometimes a company may require notes receivable when it extends credit to new customers, and in some cases it may require them for all credit sales. Notes receivable also may result from long-term contracts.

A company may receive two types of short-term notes: (1) those bearing interest on the face amount of the note and (2) non-interest-bearing notes. We discuss these short-term notes in the following sections. We discuss recording long-term notes at their fair (present) value in Chapter 14.

### Short-Term Interest-Bearing Notes Receivable

When an interest-bearing note is issued, the amount borrowed (the principal) is listed as the face value, and the interest charged is stated as a specific rate applied to this face value. When a company receives a note, it debits the Note Receivable account for the face value. After issuance, it records interest revenue on the note in the usual fashion, including any year-end adjustments for interest receivable. To illustrate, assume that on October 1, 2007, Trent Company made a \$5,000 credit sale to Jaynik Company and required the company to sign a \$5,000, 60-day, 12% note. The middle column of Example 7-3 shows the journal

9 Account for short-term notes receivable.

**EXAMPLE 7-3 Accounting for Short-Term Notes Receivable**

	Interest-Bearing		Non-interest-Bearing	
To record receipt of note on October 1, 2007	Notes Receivable	5,000	Notes Receivable	5,100
	Sales	5,000	Interest Revenue	100
			Sales	5,000
To record receipt of maturity value on December 1, 2007	Cash	5,100	Cash	5,100
	Notes Receivable	5,000	Notes Receivable	5,100
	Interest Revenue*	100		

\*\$5,000 × 0.12 × 60/360

entries on October 1, 2007 for the Trent Company to record the receipt of the interest-bearing note, and on December 1, 2007 to record the receipt of the principal and interest (assuming, for simplicity, a 360-day business year). If the note had extended past the end of the year, Trent Company would have made a year-end adjusting entry to record the interest receivable and recognize the interest revenue.

Bad debt losses may occur on transactions involving short-term notes receivable, particularly when it is common practice to require customers to sign notes for all credit sales. In these cases the company should assess the likelihood of these losses and establish an Allowance for Doubtful Notes. This procedure is the same as we discussed earlier for accounts receivable and results in an increase in its expenses and a decrease in the net realizable value of its notes receivable.

### Short-Term Non-Interest-Bearing Notes Receivable

In the case of a non-interest-bearing note, the maturity value (the amount to be collected, which includes both principal and implicit interest) is listed as the face value. Actually the term non-interest-bearing is a misnomer because all notes implicitly include interest. It is simply a case of the interest being included in the face value rather than being stated as a separate rate. A better term would be a note with no *stated interest rate*. *APB Opinion No. 21* does not require current trade receivables to be recorded at their present values because the difference between the present value and the maturity value is not likely to be significant. Consequently, many companies record short-term non-interest-bearing trade notes receivable at their maturity values. This approach, however, overstates sales revenue and understates interest revenue.

A conceptually better approach is to record the note receivable at its present value and to recognize interest revenue as it is earned. To illustrate, assume the same facts as in the earlier example except that Jaynik Company signs a \$5,100 non-interest-bearing note, due on December 1, 2007. The top of the right column of Example 7-3 shows the journal entry on October 1, 2007 for the Trent Company to record the receipt of the non-interest-bearing note. Observe in this entry that interest revenue is credited<sup>17</sup> for \$100. Although technically the company has not yet earned the interest, it will do so before the end of the accounting period. This procedure simplifies the accounting process. The journal entry on December 1, 2007 to record the receipt of the face value is shown at the bottom of the right column of Example 7-3. If the note had extended past the end of the year, Trent Company would have made a year-end adjusting entry to *reduce* (debit) the interest revenue for the interest not yet earned and to adjust (credit) an account entitled Discount on Notes Receivable. This Discount account is a contra account and is deducted from the Notes Receivable account to report the net realizable value on the balance sheet.

17. Alternatively, Discount on Notes Receivable could be credited (instead of Interest Revenue) at the time of issuance. Then, when the face value is collected (or at year-end if an adjustment is required), a journal entry must be made to reduce the discount account and increase interest revenue for the amount of interest earned.

## Notes Receivable Discounted

Occasionally a company may find that it needs additional cash on a short-term basis, but the company does not wish to borrow money or sell or assign its accounts receivable. In these cases the company may discount a customer's note receivable at a bank in return for cash. **When a company discounts a customer's note receivable at the bank, it transfers the note to the bank.** This financing arrangement is subject to the conditions of *FASB Statement No. 140* summarized in Exhibit 7-2. If all the conditions are met, the company records the transfer as a sale (without recourse). If the conditions are not met, the company records the transfer as an assignment (with recourse). Typically, the customer is notified to pay the bank directly on the maturity date. If the agreement is an assignment with recourse, there is a contingent liability during the period between the discount date and the maturity date. During this period, the company must disclose the assignment in the notes to its financial statements, even if the possibility of default by the customer is remote.<sup>18</sup>

**When a customer's note receivable is discounted, the proceeds (cash received) are determined by multiplying the discount rate times the maturity value of the note (face value of the note plus total interest) for the discount period, and deducting the resulting discount from the maturity value.** The *discount rate* is the interest rate charged by the bank. It has no relationship to the interest rate charged the customer on the note receivable. The *discount period* is the length of time from the date of discount to the maturity date. Any gain or loss from the discounting is computed by comparing the current book value of the note receivable (including accrued interest revenue) to the proceeds received. The company discounting the note makes journal entries on the date of the discount to record any accrued interest revenue, the proceeds received, and any gain or loss on the discounting of the note. It eliminates the discounted note on the maturity date.

### Example: Note Assignment

Assume that on August 31, 2007, the Kasper Corporation discounts (with recourse) a customer's note at its bank at a 14% discount rate. The note was received from the customer on August 1, is for 90 days, has a face value of \$5,000, and carries an interest rate of 12%. The customer pays the note on the October 30, 2007 maturity date. The calculations on August 31 for the discounted note are as follows (assuming a 360-day business year for simplicity):

1. Face value of note	\$5,000.00
2. Interest to maturity ( $\$5,000 \times 0.12 \times 90/360$ )	150.00
3. Maturity value of note	<u>\$5,150.00</u>
4. Discount ( $\$5,150 \times 0.14 \times 60/360$ )	<u>(120.17)</u>
5. Proceeds received	\$5,029.83
6. Accrued interest revenue: $\$50$ ( $\$5,000 \times 0.12 \times 30/360$ )	
7. Book value of note ( $\$5,000 + \$50$ )	<u>(5,050.00)</u>
8. Loss from discounting of note	<u>\$ (20.17)</u>

Kasper Corporation makes the following journal entry to record the discounted note on August 31:

Cash	5,029.83	
Loss from Discounting of Note	20.17	
Notes Receivable		5,000.00
Interest Revenue		50.00

When a note is discounted, the difference between the book value of the note and its proceeds is recorded as a gain or loss (as we did in this example) if a company usually does

18. *FASB Statement No. 5, op. cit.*, par. 12.

not discount its notes. Alternatively, if a company normally discounts its notes, the difference is reported as interest revenue or interest expense.

If the Kasper Corporation prepares an interim balance sheet on September 30, 2007, it discloses the contingent liability in the notes to its financial statements. This note might read as follows: “The company is contingently liable for a discounted note receivable of \$5,000. The company does not anticipate that this note will be defaulted on its maturity date.”

In this illustration the contingent liability was eliminated on the maturity date when the customer paid the note. If the customer does not pay this note at maturity, the bank would require Kasper to pay the maturity value of the note plus a service charge on the dishonored note. Kasper’s only recourse is to attempt to collect these amounts from the customer. Consequently, upon default Kasper establishes a Notes Receivable Dishonored account. For example, assume instead that on November 2, 2007, the bank notified Kasper that the note had not been paid and also charged Kasper a \$10 fee. At that time Kasper would record the following journal entry:

<b>Notes Receivable Dishonored</b>	<b>5,160</b>	
<b>Cash [<math>\\$5,000 + (\\$5,000 \times 0.12 \times 90/360) + \\$10</math>]</b>		<b>5,160</b>

If Kasper does not collect the dishonored note in the future, it recognizes a loss on the default. ♦

### SECURE YOUR KNOWLEDGE 7-3

- Three basic forms of financing arrangements that allow a company to accelerate the cash flow from its accounts receivable are pledging, assigning, and factoring (sale).
- If a company surrenders control over its receivables, the transaction is recorded as a sale; otherwise, the transaction is considered a secured borrowing (either an assignment with recourse or a pledge as collateral).
- Short-term, interest-bearing notes are recorded at the face value of the note receivable, and interest is recognized by applying a specific interest rate to this face value.
- Non-interest-bearing notes receivable are recorded at their maturity value (which includes both principal and implicit interest), and interest is recognized over the term of the note.
- Similar to accounts receivable, a note receivable may be discounted or transferred to a bank in exchange for cash.

## FINANCIAL STATEMENT DISCLOSURES OF RECEIVABLES

Companies are required to disclose any accounting policies related to their receivables that might be helpful to external users. Furthermore, **FASB Statement No. 133** requires a company to *recognize* as assets any derivative financial instruments that involve rights of the company (e.g., a “hedge” of the exposure to changes in the fair value of receivables), based on their fair value. The *Statement* also requires a company to disclose information such as the types of derivative instruments it holds, its objectives in holding the instruments, and its strategies for achieving these objectives. The description must indicate the company’s risk management policy in regard to each type of instrument. **FASB Statement No. 107** requires a company to *disclose* the fair value of all its financial instruments, whether recognized or not on the balance sheet. The *Statement* also requires a company to disclose all significant concentrations of credit risk due to its financial instruments. A company typically makes these disclosures in the notes to its financial statements. The intent of these disclosures is to improve the reporting of a company’s *risk, liquidity, and*

financial flexibility.<sup>19</sup> Real Report 7-3 shows an excerpt from Apple Computer's 2004 year-end balance sheet and related Note 2 illustrating the presentation of receivables.

### Real Report 7-3 Disclosure of Accounts Receivable

#### APPLE COMPUTER, INC.

#### CONSOLIDATED BALANCE SHEETS

September 25, 2004 and September 27, 2003

	2004	2003
(in millions)		
Current Assets: (in part)		
Accounts receivable, less allowances of \$47 and \$49, respectively	\$774	\$776

Notes to Consolidated Financial Statements (in part)

#### NOTE 2

##### Trade Receivables

The following table summarizes the activity in the allowance for doubtful accounts (in millions):

	2004	2003
Beginning allowance balance	\$49	\$51
Charged to costs and expenses	3	4
Deductions (a)	<u>(5)</u>	<u>(6)</u>
Ending allowance balance	<u>\$47</u>	<u>\$49</u>

(a) Represents amounts written off against the allowance, net of recoveries.

#### Questions:

1. For 2004 recreate the summary journal entries that Apple Computer must have made for its Allowance account.
2. Based on the information presented, comment on the effect of Apple Computer's estimate of bad debt expense on the financial statements for the period presented.

A company includes collections of its accounts receivable and notes receivable from sales in the operating activities section of its statement of cash flows. If a company normally factors its accounts receivable, it generally reports the cash proceeds from the sale in the operation activities section. However, if a company assigns its accounts receivable, the cash proceeds from the loan are reported in the financing section of its statement of cash flows. Collections of interest on notes receivable are included in operating cash flows. However, the receipt by a company of the principal on a note receivable issued for a loan is treated as a cash inflow from an investing activity. When a company discounts a note receivable, the cash received is treated as a cash inflow from a financing activity on its statement of cash flows.

## APPENDIX: INTERNAL CONTROLS FOR CASH

Two important elements of internal control over cash are a petty cash fund and a bank reconciliation. We discuss each of these elements in the following sections.

19. "Accounting for Derivative Instruments and Hedging Activities," *FASB Statement of Financial Accounting Standards No. 133* (Norwalk, Conn.: FASB, 1998), par. 17 and 44; and "Disclosures about Fair Value of Financial Instruments," *FASB Statement of Financial Accounting Standards No. 107* (Norwalk, Conn.: FASB, 1991), par. 7 and 15A.

## PETTY CASH

A petty cash system involves a cash fund under the control of an employee that enables a company to pay for small amounts that might be impractical or impossible to pay by check. For example, a company requiring employees to work overtime may have a policy of sending late-working employees home by taxi. Since taxi drivers do not usually accept checks, the company may give these employees cash to pay the taxi fare. Small amounts of cash may also be needed to pay for postage, deliveries, the purchase of small amounts of office supplies, and other items. A company may use a petty cash system for these purposes. The design and operation of a petty cash system includes the following steps:

1. An employee is appointed petty cash custodian. The petty cash fund is established at an amount estimated to be enough to cover expenditures over a short period of time, and the fund is turned over to the employee. The journal entry to record the establishment of the fund is a debit to Petty Cash and a credit to Cash for \$500 (amount assumed).
2. Petty cash vouchers are printed, prenumbered, and given to the custodian of the fund. The vouchers are used as evidence of expenditures. Therefore at all times the total of the cash in the fund plus the amounts of expenditure vouchers should be equal to the original amount of the fund, in this case \$500. The custodian completes a petty cash voucher each time a payment from the fund is made, but journal entries are *not* recorded at this time.
3. When the amount of cash in the petty cash fund becomes low and/or at the end of an accounting period, the vouchers are sorted into expense categories and the remaining cash is counted. The expenses are then recorded and the fund is replenished. At this time, a Cash Short and Over account is used to record any “shortage” or “overage” between the original petty cash fund balance and the remaining cash in the fund plus the amounts of the petty cash vouchers. The account helps to highlight errors and improve internal control. For example, assume that a count at the end of the month shows \$67.54 remaining in the petty cash fund, and the sorting of vouchers indicates the following costs were incurred during the month:

Office supplies	\$ 34.16
Postage	178.00
Transportation	132.14
Miscellaneous	<u>83.76</u>
Total expenses	<u>\$428.06</u>

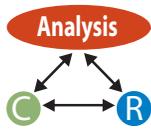

Since these expenses total \$428.06 and the amount needed to replenish the fund is \$432.46 (\$500 – \$67.54), the fund is “short” by \$4.40. The company records (debits) the actual expenses (along with Cash Short and Over), rather than petty cash, as follows when it replenishes the fund:

Office Supplies Expense	34.16	
Postage Expense	178.00	
Transportation Expense	132.14	
Miscellaneous Expense	83.76	
Cash Short and Over	4.40	
Cash		432.46

The \$432.46 is given to the fund custodian, and the actual amount of cash in the petty cash fund is now equal to the original fund balance of \$500. The company reports the expenses on its income statement. It reports a debit balance in the Cash Short and Over account at the end of the accounting period as a miscellaneous expense; it reports a credit balance as a miscellaneous revenue. The company includes the balance of the petty cash fund as part of the Cash amount reported on its balance sheet when it issues financial statements.

**10** Understand a petty cash fund.

## BANK RECONCILIATION

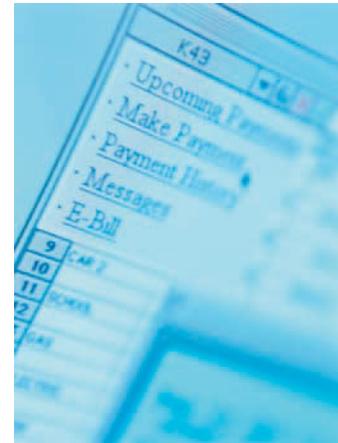

The information in a company's Cash account is also kept by an external independent party, the company's bank. Therefore it is a good internal control procedure to use one to verify the other. A bank reconciliation is a schedule that a company prepares to analyze the difference between the ending cash balance in its accounting records and the ending cash balance reported by its bank in a bank statement to determine the correct ending cash balance.

Banks send a monthly statement to each depositor summarizing the activities that have taken place in the depositor's account. These activities include deposits, checks cleared, miscellaneous items, and the ending balance in the checking account. Also included with the bank statement may be photos of the depositor's canceled checks. Every company has a checking account and keeps its own accounting records of its deposits and checks. The bank statement and the company's accounting records usually will not be in complete agreement. When the company receives the bank statement each month, it prepares a bank reconciliation to compare the bank statement balance and its cash balance to reconcile these records.

### Causes of the Difference

The causes of the difference between the cash balance listed on a company's bank statement and the balance shown in the company's cash account include the following items:

1. **Outstanding Checks.** An outstanding check is a check written by the company and deducted from its cash balance that the bank has not yet deducted from the balance reported on the bank statement. On the date a company issues a check, it reduces its Cash account. A period of time is necessary for the check to be received by the payee (the recipient of the check), deposited in the payee's bank, and subtracted from the company's bank balance. Therefore a company has a certain number of outstanding checks at the end of each month that causes its Cash account balance to be less than the balance on the bank statement.
2. **Deposits in Transit.** A deposit in transit is a cash receipt added to the company's cash balance but not yet added to the balance reported on the bank statement. When a company receives a check, it increases its Cash account. A period of time may pass before the check is deposited by the company and recorded by the bank. At the end of each month the company may have deposits in transit (either cash or checks) that cause its Cash account balance to be greater than the balance on the bank statement.
3. **Charges Made Directly by the Bank.** A bank frequently imposes a service charge for a depositor's checking account and deducts this charge directly from the account.

Banks also charge for the cost of printing checks and for stopping payment on checks. The bank reports these charges on the bank statement.

When the company receives a customer's check, it deposits the check in its bank as a cash receipt even though the customer's bank has not yet transferred the cash from the customer's bank account to the company's bank account. Occasionally, the company's bank is unable to collect the amount of the customer's check. That is, the customer's check has "bounced." **NSF (not sufficient funds) is the term used for a customer's check that a company has deposited in its bank account but has not been paid by the customer's bank because there is not enough cash in the customer's account.** Because the bank has not received payment from the customer, it deducts this amount from the company's bank account. Consequently, there may be some NSF checks included in the bank statement that the company has not recorded.

At the end of the month the bank lists all of these charges as deductions from the company's cash balance on the bank statement even though the company may not have deducted them from its cash balance in its accounting records. Therefore the bank statement balance is less than the balance in the company's Cash account.

4. **Deposits Made Directly by the Bank.** A bank often acts as a collection agency for its customers on items such as notes receivable. In addition, most checking accounts earn interest. When the bank collects a note, it records the amount (principal and interest) as an increase in the company's bank account. Consequently, the bank statement may include notes received by the bank that the company has not yet recorded in its accounting records. The company may not know the amount of interest it has earned on its checking account until it receives the bank statement. In both these situations the bank statement balance is greater than the balance in the company's Cash account.
5. **Errors.** Despite the internal control procedures established by the bank and the company, the company may discover errors in either the bank's records or its records when it prepares the bank reconciliation. For example, a bank may include a deposit or a check from another customer's account or make an error in recording an amount. A company may similarly make an error in recording an amount. For example, a common error is to transpose two numbers, so that the correct amount of \$426 is recorded as \$462.

## Procedures for Preparing a Bank Reconciliation

Given the items that might cause a difference between the ending balance in a company's Cash account and the ending cash balance from the bank statement, the company should follow a list of procedures in preparing its bank reconciliation:

1. **Compare the deposits listed in the company's records with the deposits shown on the bank statement.** Determine that the deposits in transit included in the *last* month's bank reconciliation are listed in this month's bank statement. These deposits do not need any adjustment in the bank reconciliation. If they are *not* shown on the bank statement, immediately investigate to determine if an error or theft has occurred. Identify any deposits for the current month that are not listed on the bank statement. Add the amounts of all the deposits in transit to the ending cash balance of the bank statement in the reconciliation.
2. **Compare the checks listed in the company's records with the checks shown on the bank statement.** Determine that the outstanding checks included in last month's bank reconciliation are listed in this month's bank statement. These checks do not need any adjustment in the bank reconciliation. If they are *not* shown on the bank statement, investigate to determine if the checks were received by the creditors so that the company's "credit rating" is not affected. Identify any checks for the current month not deducted in the bank statement. Subtract the amounts of all the outstanding checks from the ending cash balance of the bank statement in the reconciliation.

**11** Prepare a bank reconciliation.

3. **Identify any deposits or charges made directly by the bank that are not included in the company's records.** These items include collections of notes receivable, interest earned on the checking account, service charges, NSF checks, and so on, which are listed on the bank statement. Add the collections to or subtract the charges from the company's ending cash balance in the bank reconciliation.
4. **Determine the effect of any errors.** If an error is found, the nature of the error determines whether to add the error to or subtract the error from the company's ending cash balance or from the ending cash balance of the bank statement.
5. **Complete the bank reconciliation.** Use the format we discuss below.

A company is required to report on its balance sheet the amount of cash over which it has control at the end of an accounting period. Our discussion focuses on the form of reconciliation that arrives at an *adjusted*, or *corrected*, cash balance, indicating the amount of cash that a company reports on its balance sheet. We illustrate this form of bank reconciliation as follows (using assumed amounts):

Cash balance from bank statement		\$7,218
Add: Receipts recorded on the company's records but not reported on the bank statement. <i>Examples:</i> deposits in transit and cash received and recorded but not yet deposited		629
		\$7,847
Deduct: Payments recorded on the company's records but not reported on the bank statement. <i>Example:</i> outstanding checks		(516)
Adjusted Cash Balance		\$7,331
Cash balance from company records		\$6,925
Add: Receipts reported on the bank statement but not recorded on the company's records. <i>Examples:</i> notes receivable and interest collected by the bank or interest earned on the funds on deposit		715
		\$7,640
Deduct: Payments reported on the bank statement but not recorded on the company's records. <i>Examples:</i> bank service charge and customers' checks returned for lack of funds (NSF checks)		(309)
Adjusted Cash Balance		\$7,331

After the company completes the bank reconciliation, it makes journal entries to bring its accounts up to date. The company only makes journal entries for the adjustments it made to its records on the bank reconciliation. It does *not* make journal entries for the adjustments it made to the bank statement balance on the reconciliation; the bank will record these adjustments in its accounts at the appropriate time.

### Example: Bank Reconciliation

The following example shows the preparation of a bank reconciliation and the required adjusting entries for the Craig Corporation for the month ended June 30, 2007. The unadjusted cash balances are as follows:

Cash balance from bank statement, June 30	\$12,461.15
Cash balance from company records, June 30	12,437.94

The bank statement disclosed the following information:

1. A customer note for \$1,200 plus \$12 interest was collected on June 29.
2. A customer check for \$138.14 was returned because of insufficient funds (NSF check).
3. The monthly service charge was \$15.

A review of the company records disclosed the following:

1. A deposit for \$1,142.87 at the end of the day on June 30 did not appear on the bank statement.
2. Customer checks totaling \$327.40 were on hand at the end of June awaiting deposit.
3. The following company checks were outstanding at the end of June:
 

#862	\$ 96.19
#864	147.18
#865	263.25
4. Check #843, written for \$91.20 in payment of an account payable and included with the canceled checks in the bank statement, was erroneously recorded as \$19.20 in the company's records.

The upper part of Example 7-4 shows the preparation of a bank reconciliation based on this information. After completing the reconciliation, the Craig Corporation prepares adjusting entries to record those items not previously included in its accounts. We show these entries in the bottom part of Example 7-4 (with arrows to indicate which items are adjusted). These adjusting entries adjust the Cash account to \$13,424.80, the amount that Craig Corporation reports as its cash balance (along with any petty cash) on its June 30, 2007 balance sheet. ♦

#### EXAMPLE 7-4 Bank Reconciliation and Adjusting Entries

##### Craig Corporation Bank Reconciliation June 30, 2007

Cash balance from bank statement			\$12,461.15
Add:	Deposit in transit	\$1,142.87	
	Checks on hand	<u>327.40</u>	<u>1,470.27</u>
			\$13,931.42
Deduct:	Outstanding checks:		
	#862	\$ 96.19	
	#864	147.18	
	#865	<u>263.25</u>	<u>(506.62)</u>
Adjusted Cash Balance			<u><u>\$13,424.80</u></u>

Cash balance from company records			\$12,437.94
Add:	Note collected by bank	\$1,200.00	
	Interest on note	<u>12.00</u>	<u>1,212.00</u>
			\$13,649.94
Deduct:	Bank service charge	\$ 15.00	
	NSF check returned	138.14	
	Error in recording check #843	<u>72.00</u>	<u>(225.14)</u>
Adjusted Cash Balance			<u><u>\$13,424.80</u></u>

##### Adjusting Entries

June 30	Cash	1,212.00	
	Notes Receivable (note collected)		1,200.00
	Interest Revenue (interest collected)		12.00
30	Miscellaneous Expense		
	(bank service charge)	15.00	
	Accounts Receivable (NSF check)	138.14	
	Accounts Payable (error)	72.00	
	Cash		<u>225.14</u>

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

- 1. Identify items of cash (and cash equivalents).** Cash consists of coins and currency, unrestricted funds on deposit with a bank (checking and savings accounts), negotiable checks, and bank drafts. Cash equivalents are short-term, highly liquid investments (having maturity dates of three months or less from the date acquired) that are readily convertible into known amounts of cash.
- 2. Understand the importance of cash management.** Cash management is important so that a company has enough cash available to pay its bills, but does not have idle cash as a nonproductive resource. To do so, a company must have sound cash planning systems (cash budget) and sound cash control systems (internal control).
- 3. Discuss revenue recognition when the right of return exists.** When the right of return exists, a company recognizes revenue at the time of the sale only when six conditions are met. Briefly, these are: (1) the sales price is known, (2) the buyer has paid or will pay, (3) the buyer's obligation is not affected by theft or damage, (4) the buyer is a separate entity from the seller, (5) the seller does not have to help resell the product, and (6) the seller can estimate the future returns.
- 4. Understand the credit policies and internal control related to accounts receivable.** A company sells on credit to increase sales. Credit policies should be closely associated with customers' credit ratings. A company should adopt a credit policy that combines increased customer satisfaction with increased sales revenue, credit department costs, and bad debt losses in a way that results in the highest incremental profit and cash flows. A company should use prenumbered invoices and separate the sales function from the collection function to help maintain internal control over accounts receivable.
- 5. Explain the gross and net methods to account for cash discounts.** Under the gross method, a company records accounts receivable and sales at the gross price. If the customer takes the cash discount, the company debits Sales Discounts Taken for the amount of the discount. Under the net method, a company records accounts receivable and sales at the net price. If the customer does not take the cash discount, the company credits Sales Discount Not Taken for the amount of the lost discount.
- 6. Estimate and record bad debts using a percentage of sales.** Under the percentage of sales method, a company debits the bad debts expense account and credits the allowance account for an amount based on an estimate of the percentage of the current sales that will not be collected.
- 7. Estimate and record bad debts using an aging analysis.** Under the aging method, a company first classifies its accounts receivable into categories based on their age. Then it multiplies the amount in each category by the percentage estimated to be uncollectible, and sums the expected uncollectible amounts. Finally, it deducts this sum from the balance in the allowance account to determine the amount to record as a debit to bad debts expense and a credit to the allowance account.
- 8. Explain pledging, assignment, and factoring of accounts receivable.** When a company *pledges* accounts receivable, it uses these accounts as collateral for a loan. When a company *assigns* accounts receivable, it enters into a lending agreement with a financial institution to receive cash on specific customer accounts. When a company *factors* accounts receivable, it sells individual accounts to a financial institution.
- 9. Account for short-term notes receivable.** When a company receives an interest-bearing note receivable, it records the note at its face value. It then records interest revenue when it collects the note. When a company receives a non-interest-bearing note, it records the note at its maturity value and, for simplicity, also records interest revenue at this time.
- 10. Understanding a petty cash fund (Appendix).** A petty cash system involves assigning a cash fund to an employee who has control over the fund, and who pays for small amounts (e.g., postage) that might be impractical or impossible to pay by check. At all times the amount of the cash in the fund plus the amount of expenditure vouchers should be equal to the original amount in the fund.
- 11. Prepare a bank reconciliation (Appendix).** To prepare a bank reconciliation, add the amounts of any deposits in transit to, and subtract the amounts of any outstanding checks from, the ending bank statement balance. Next, add any collections or subtract any charges made directly by the bank to or from the company's ending cash balance. Then adjust the ending bank statement balance or company's ending cash balance for any errors, and complete the bank reconciliation.

## ANSWERS TO REAL REPORT QUESTIONS

### Real Report 7-1 Answers

- Cash and cash equivalents are reported as one combined amount because the investment is readily convertible into cash (three months or less at the date of purchase), and the risk that the short-term investment's value will change significantly due to a change in interest rates is minimal.

### Real Report 7-2 Answers

1. In a factoring arrangement, the receivables are sold, without recourse, to the factor. Because the factor assumes all risks of ownership and cannot demand payment from UNIFI for any uncollectible accounts, no allowance for uncollectible accounts is needed. The factor is assuming all losses from uncollectible accounts.
2. The factors will charge UNIFI a commission which is usually based on the amount of the receivables transferred. Additionally, UNIFI will incur costs related to notifying its customers that their receivables have been factored. Apparently, UNIFI believes it will be cheaper to collect the receivables itself rather than incur the costs associated with the factoring arrangement.

### Real Report 7-3 Answers

1. The appropriate journal entries (dollars in millions) would be:
 

Bad Debt Expense	3	
Allowance for Doubtful Accounts		3
Allowance for Doubtful Accounts	5	
Accounts Receivable		5
2. Assuming that delinquent accounts receivable are written off relatively quickly (e.g., when they are six months overdue), Apple appears to be underestimating bad debt expense since write-offs exceed the expense by approximately \$2 million. This underestimate of expense would have the effect of increasing Apple Computer's reported income.

## QUESTIONS

**Q7-1** What are the components of cash? What items may be confused with cash, but normally are categorized under other balance sheet captions? What are "cash equivalents"?

**Q7-2** What is internal control?

**Q7-3** What are the two revenue recognition criteria and how do they relate to receivables in some industries?

**Q7-4** Briefly discuss the two methods of recording accounts receivable when cash discounts are involved.

**Q7-5** What is a sales return? A sales allowance? Conceptually, when should sales returns and allowances be recorded?

**Q7-6** Discuss the differences between the estimation (allowance) methods of recording bad debts and the direct write-off method.

**Q7-7** Explain how a company estimates bad debts using (a) the sales or income statement approach, and (b) the accounts receivable or balance sheet approach.

**Q7-8** Define the *net realizable value* of a company's accounts receivable. How is the net realizable value of accounts receivable reported on the company's balance sheet?

**Q7-9** What method of bad debt estimation categorizes individual accounts receivable based on the length of time outstanding? Why is this length of time an important factor?

**Q7-10** Why does the write-off of uncollectible accounts have no effect on the net realizable accounts receivable on the balance sheet if bad debts are estimated? What is the effect of this write-off on the income statement?

**Q7-11** Define pledging, assigning, and factoring of accounts receivable.

**Q7-12** When does a company record the transfer of accounts receivable as a sale? As a liability?

**Q7-13** What is a note receivable? How do notes receivable differ from accounts receivable?

**Q7-14** What is a non-interest-bearing note? How does accounting for a short-term non-interest-bearing note differ from a short-term interest-bearing note?

**Q7-15** What are notes receivable discounted? How are discounted notes disclosed on the financial statements during the period between the discount date and maturity date?

**Q7-16** How are the cash proceeds determined when a note receivable is discounted?

**Q7-17 (Appendix)** What is the purpose of a petty cash system?

**Q7-18 (Appendix)** Why are actual expenses, rather than the petty cash account, debited when the fund is replenished?

**Q7-19 (Appendix)** What is a bank reconciliation? List the causes of the difference between the cash balance listed on a company's bank statement and the balance shown in the company's cash account.

**Q7-20 (Appendix)** Why are adjusting entries made after the bank reconciliation is completed? Give an example of an item on a bank reconciliation which requires an adjusting entry.

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

**M7-1** Which of the following items should be classified under the heading of cash on the balance sheet?

	Postdated checks	Certificates of deposit
a.	Yes	Yes
b.	Yes	No
c.	No	No
d.	No	Yes

**M7-2** Greenfield Company had the following cash balances at December 31, 2007:

Cash in banks	\$1,500,000
Petty cash funds (all funds were reimbursed on December 31, 2007)	20,000
Cash legally restricted for additions to plant (expected to be disbursed in 2009)	2,000,000

Cash in banks includes \$500,000 of compensating balances against short-term borrowing arrangements at December 31, 2007. The compensating balances are not legally restricted as to withdrawal by Greenfield. In the current assets section of Greenfield's December 31, 2007 balance sheet, what total amount should be reported as cash?

- a. \$1,020,000                      c. \$3,020,000  
b. \$1,520,000                      d. \$3,520,000

**M7-3** On January 1, 2007, King Company's Allowance for Doubtful Accounts had a credit balance of \$15,000. During 2007 King, (1) charged \$32,000 to bad debt expense, (2) wrote off \$23,000 of uncollectible accounts receivable, and (3) unexpectedly recovered \$6,000 of bad debts written off in the prior year. The Allowance for Doubtful Accounts balance at December 31, 2007 should be:

- a. \$47,000                              c. \$30,000  
b. \$32,000                              d. \$24,000

**M7-4** A company is in its first year of operations and has never written off any accounts receivable as uncollectible. When the allowance method of recognizing bad debt expense is used, the entry to recognize that expense

- a. Increases net income  
b. Decreases current assets  
c. Has no effect on current assets  
d. Has no effect on net income

**M7-5** Tallent Company received a \$30,000, 6-month, 10% interest-bearing note from a customer. After holding the note for two months, Tallent was in need of cash and discounted the note at the United National Bank at a 12% discount rate. The amount of cash received by Tallent from the bank was

- a. \$31,260                              c. \$30,300  
b. \$30,870                              d. \$30,240

**M7-6** When the accounts receivable of a company are sold outright to a company that normally buys accounts receivable of other companies without recourse, the accounts receivable have been

- a. Factored                              c. Pledged  
b. Assigned                              d. Collateralized

**M7-7** A method of estimating bad debts that focuses on the income statement rather than the balance sheet is the allowance method based on

- a. Direct write-off  
b. Aging the trade receivable accounts  
c. Credit sales  
d. The balance in the trade receivable accounts

**M7-8** Prior to adjustments, Barrett Company's account balances at December 31, 2007 for Accounts Receivable and the related Allowance for Doubtful Accounts were \$1,200,000 and \$60,000, respectively. An aging of accounts receivable indicated that \$106,000 of the December 31, 2007 receivables may be uncollectible. The net realizable value of accounts receivable was

- a. \$1,034,000                              c. \$1,140,000  
b. \$1,094,000                              d. \$1,154,000

**M7-9** Marmol Corporation uses the allowance method for bad debts. During 2007 Marmol charged \$30,000 to bad debt expense and wrote off \$25,200 of uncollectible accounts receivable. These transactions resulted in a decrease in working capital of

- a. \$0    c. \$25,200  
b. \$4,800                                      d. \$30,000

**M7-10** The following bank reconciliation is presented for the Kingston Company for the month of November 2007:

Balance per bank statement, 11/30/07	\$18,040
Add: Deposit in transit	4,150
	<u>\$22,190</u>
Less: Outstanding checks	\$ 6,300
Bank credit recorded in error	20
Balance per books, 11/30/07	<u><u>\$15,870</u></u>

Data for the month of December 2007 follow:

Per bank	
December deposits	\$26,100
December disbursements	22,420
Balance, 12/31/07	21,720

All items that were outstanding as of November 30 cleared through the bank in December, including the bank credit. In addition, \$2,500 in checks were outstanding as of December 31, 2007. What is the balance of cash per books at December 31, 2007?

- a. \$19,220                              c. \$21,720  
b. \$19,240                              d. \$24,220

## EXERCISES

**E7-1** *Computing the Cash Balance* Indicate whether or not each of the following ten items should be included in the cash balance presented on the balance sheet. Also indicate the normal balance sheet treatment for those items not included as cash.

Item	Include in Cash Balance	Classification of Items Excluded
1. NSF checks	_____	_____
2. Savings account	_____	_____
3. Postage stamps	_____	_____
4. Postdated checks	_____	_____
5. IOUs	_____	_____
6. Cash on hand	_____	_____
7. Cash in sinking fund	_____	_____
8. Travel advance	_____	_____
9. Bank draft	_____	_____
10. Traveler's checks	_____	_____

**E7-2** *Reporting Cash on the Balance Sheet* Your audit of the Watt Corporation discovers the following information:

1. Reconciled balance in First National Bank checking account	\$ 2,360.75
2. Reconciled balance in City National Bank checking account	(40.20)
3. Balance in First Federal savings account	28,750.00
4. Certificate of deposit	30,000.00
5. Postage stamps	100.00
6. Employee's IOU	125.00
7. Employees' travel advances	1,640.00
8. Cash on hand (undeposited sales receipts)	3,609.40
9. Traveler's checks	600.00
10. Customer's postdated check	290.40

### Required

1. What amount should be reported as cash on Watt's balance sheet?
2. Describe the balance sheet treatment of the items not included in the cash balance.

**E7-3** *Journal Entry to Separate Receivables* An examination of the accounting records for the Hutton Corporation indicates that all receivables are being recorded in a single account entitled Receivables. An analysis of the account reveals the following:

Accounts receivable (trade)	\$15,500
Accounts receivable (officers)	3,600
Common stock subscriptions receivable (current)	12,000
Advances to employees	1,800
Notes receivable (trade), due in 3 years	6,000
Deposit to guarantee contract performance	5,000
Utility deposit	500
Total	<u>\$44,400</u>

### Required

1. Prepare a journal entry to separate the preceding items into their proper accounts.
2. How would each of the preceding items normally be reflected on Hutton's balance sheet?

**E7-4** *Accounting for Sales Discounts* On December 8, 2007, Lynch Incorporated sold \$9,000 of merchandise with terms 2/10, n/EOM. On December 18, 2007, collections were made on sales originally billed for \$5,000, and on December 31, 2007, additional collections on sales originally billed for \$3,000 were received.

### Required

Prepare the journal entries to record the sale, collections, and any required year-end adjustments under (1) the gross price method, and (2) the net price method.

**E7-5 Comparison of Discount Methods** The Eastman Corporation sells merchandise with a list price of \$13,000 on February 1, 2007, with terms of 1/10, n/30. On February 10, 2007, payment was received on merchandise originally billed for \$7,500, and the balance due was received on February 28, 2007.

**Required**

Prepare journal entries to record the preceding information using (1) the gross price method, and (2) the net price method.

**E7-6 Returns and Allowances** Towbin Products sells merchandise on credit for \$7,000 on December 1, 2007. The company estimates that returns and allowances will amount to 4% of sales. On December 22, 2007, a customer returns for credit merchandise originally sold on December 1 for \$200.

**Required**

1. Prepare journal entries to record the preceding sale and the return of merchandise if returns are recorded as they occur.
2. Prepare journal entries to record the preceding sale, the estimation of returns and allowances, and the actual return of goods, if returns and allowances are estimated at the end of the period of sale.
3. How would the preceding information be reflected on Towbin's December 31, 2007 financial statements if (a) returns are recorded as they occur, and (b) returns are estimated in the period of sale?

**E7-7 Estimation vs. Direct Write-Off of Bad Debts** The Blunt Company makes credit sales of \$21,000 during the month of February 2007. During 2007 collections are received on February sales of \$20,400, accounts representing \$600 of these sales are written off as uncollectible, and a \$100 account previously written off is collected.

**Required**

Prepare the journal entries necessary to record the preceding information if (1) bad debts are estimated as 3% of sales at the time of sale, and (2) the bad debts are recorded as they actually occur.

**E7-8 Estimating Bad Debts from Receivables Balances** The following information is extracted from the accounting records of the Shelton Corporation at the beginning of 2007:

Accounts Receivable	\$63,000
Allowance for Doubtful Accounts	1,400 (credit)

During 2007, sales on credit amounted to \$575,000, \$557,400 was collected on outstanding receivables, and \$2,600 of receivables were written off as uncollectible. On December 31, 2007, Shelton estimates its bad debts to be 4% of the outstanding gross accounts receivable balance.

**Required**

1. Prepare the journal entry necessary to record Shelton's estimate of bad debt expense for 2007.
2. Prepare the Accounts Receivable section of Shelton's December 31, 2007 balance sheet.
3. Compute Shelton's receivables turnover.

**E7-9 Aging Analysis of Accounts Receivable** Cowen's, a large department store located in a metropolitan area, has been experiencing difficulty in estimating its bad debts. The company has decided to prepare an aging schedule for its outstanding accounts receivable and estimate bad debts by the due dates of its receivables. This analysis discloses the following information:

Balance	Age of Receivable	Estimated Percentage Uncollectible
\$193,000	Under 30 days	0.8%
114,000	30–60 days	2.0%
73,000	61–120 days	5.0%
41,000	121–240 days	20.0%
25,000	241–360 days	35.0%
19,000	Over 360 days	60.0%
<u>\$465,000</u>		

**Required** 

1. Use the preceding analysis to compute the estimated amount of uncollectible receivables.
2. Prepare the journal entry to record Cowen's estimated uncollectibles, assuming the balance in the Allowance for Doubtful Accounts prior to adjustment is:
  - a. 0
  - b. \$3,000 (debit)
  - c. \$2,800 (credit)

**E7-10 Comparison of Bad Debt Estimation Methods** The following information (prior to adjustment) is available from the accounting records of the Bradford Company on December 31, 2007:

Cash sales	\$ 93,100	
Net credit sales	<u>262,900</u>	
Total sales (net)		\$356,000
Accounts receivable		126,300
Allowance for doubtful accounts		2,150 (credit)

**Required**

Prepare journal entries to record the estimate of Bradford's bad debt expense for 2007 assuming:

1. Bad debts are estimated to be 1.5% of total sales (net).
2. Bad debts are estimated to be 2% of net credit sales.
3. Bad debts are estimated to be 5% of gross accounts receivable.

**E7-11 AICPA Adapted Receivables—Bad Debts** At January 1, 2007 the credit balance in the Allowance for Doubtful Accounts of the Master Company was \$400,000. For 2007 the provision for doubtful accounts is based on a percentage of net sales. Net sales for 2007 were \$50,000,000. Based on the latest available facts, the 2007 provision for doubtful accounts is estimated to be 0.7% of net sales. During 2007 uncollectible receivables amounting to \$410,000 were written off against the allowance for doubtful accounts.

**Required** 

Prepare a schedule computing the balance in Master's Allowance for Doubtful Accounts at December 31, 2007. Show supporting computations in good form.

**E7-12 Assigning Accounts Receivable** White Corporation has entered into a long-term assignment agreement with a finance company. Under the terms of this agreement, White receives 80% of the value of all accounts assigned and is charged a 1% service charge which is based upon the actual dollar amount of cash received. Additionally, the finance company charges White 12% annual interest on the outstanding loan. The following selected transactions relate to this agreement:

December 1, 2007	Accounts receivable of \$160,000 are assigned.
December 11, 2007	A sales return of \$1,000 on an assigned account is allowed by White.
December 31, 2007	Collections are made on \$86,000 of assigned accounts. This amount and 1 month's interest on the outstanding loan are remitted to the finance company. (For simplicity, compute interest to the nearest month.)
January 29, 2008	\$50,000 of assigned accounts are collected and the remainder of the loan is repaid.

**Required**

1. Prepare journal entries on White's books to record the preceding transactions.
2. How would this assignment agreement be reported on White's December 31, 2007 balance sheet (assume the note payable is short-term)?

**E7-13 Factoring Accounts Receivable** The Inder Corporation is experiencing a temporary cash shortage and decides to factor a group of its accounts receivable. The factor accepts \$80,000 of Inder's accounts receivable, remits 90% of the accounts receivable factored, and charges a 16% commission on the gross amount of the factored receivables. During the period, sales returns and allowances on factored accounts amounted to \$1,500.

**Required**

Prepare all the journal entries necessary by Inder to record the preceding information.

**E7-14 AICPA Adapted Generating Cash from Receivables** The Guide Company requires additional cash for its business. Guide has decided to use its accounts receivable to raise the additional cash as follows:

1. On June 30, 2007, Guide assigned \$200,000 of accounts receivable to the Cell Finance Company. Guide received an advance from Cell of 85% of the assigned accounts receivable, less a commission on the advance of 3%. Prior to December 31, 2007, Guide collected \$150,000 on the assigned accounts receivable and remitted \$160,000 to Cell, \$10,000 of which represented interest on the advance from Cell.
2. On December 1, 2007, Guide sold \$300,000 of net accounts receivable to the Factoring Company for \$260,000. The receivables were sold outright on a nonrecourse basis.
3. On December 29, 2007, Guide received an advance of \$100,000 from the Domestic Bank by pledging \$120,000 of Guide's accounts receivable. Guide's first payment to Domestic is due on January 29, 2008.

**Required**

Prepare a schedule showing the income statement effect for the year ended December 31, 2007, as a result of the preceding facts. Show supporting computations in good form.

**E7-15 Interest-Bearing and Non-Interest-Bearing Notes** On December 11, 2007, the Hooper Bank loans a customer \$12,000 on a 60-day, 12% note.

**Required**

Prepare the journal entries necessary to record the receipt of the note by Hooper, the accrual of interest on December 31, 2007, and the customer's repayment on February 9, 2008, assuming:

1. Interest was assessed in addition to the face value of the note.
2. The note was issued as a \$12,000 non-interest-bearing note.

**E7-16 Computing the Proceeds from Discounted Notes** Below are several customer notes.

1. An \$8,000, 60-day, non-interest-bearing note discounted after 15 days at 12%.
2. A \$9,000, 12%, 60-day note discounted after 30 days at 14%.
3. A \$6,000, 10%, 90-day note discounted after 30 days at 12%.
4. A \$10,000, 12%, 120-day note discounted after 45 days at 15%.

**Required** 

Determine the proceeds from each of the preceding discounted customer notes.

**E7-17 Recording Notes Receivable Discounted** The following are events of the Singer Corporation for the current year:

June 30	Barney Manufacturing gives Singer a \$5,000, 11%, 90-day note for merchandise purchased.
July 15	Dillon Construction Co. gives Singer a \$6,000, 10%, 60-day note for merchandise originally purchased on April 20 of the current year.
July 30	The Barney and Dillon notes are discounted with recourse by Singer at its bank at 12%.
Sept. 15	The bank notifies Singer that the Dillon note was paid.
Sept. 30	The bank notifies Singer that Barney defaulted on the note and charges the amount of principal, interest, and a fee of \$10 against Singer's bank account.

**Required**

Prepare journal entries to record the preceding information on Singer's accounting records. (Assume that the company does not normally discount its notes.)

**E7-18 Petty Cash Transactions (Appendix)** The Crown Company established a petty cash fund of \$600 for incidental expenditures on January 2, 2007. At the end of the month the count of cash on hand indicated that \$57.35 remained in the fund. A sorting of petty cash vouchers disclosed that the following expenses had been incurred during the month, and the fund was replenished.

Postage expense	\$250.40
Office supplies expense	165.90
Miscellaneous expense	119.05

**Required**

Prepare the journal entries necessary to record the Crown Company's petty cash transactions during the month of January 2007.

**E7-19 Adjusting an Unknown Cash Balance (Appendix)** The information that follows is available from the general ledger and the bank statement of the Gentry Corporation for the month of August 2007:

1. Bank statement balance, August 31	\$1,342.50
2. Note collected by the bank not previously recorded by Gentry	600.00
3. Interest on the preceding note (not previously recorded)	25.00
4. NSF check returned with the bank statement (not previously recorded)	212.60
5. Outstanding checks at the end of August	684.70
6. Bank service charge for August	12.85
7. Deposit in transit, August 31	329.42

**Required**

1. Starting with the bank statement balance, prepare a schedule to determine Gentry's cash balance on August 31, 2007, prior to any required adjustments.
2. Prepare a bank reconciliation to determine Gentry's adjusted cash balance on August 31, 2007.
3. Prepare the journal entries necessary to bring Gentry's cash account balance up to date.

**E7-20 Bank Reconciliation (Appendix)** The following information is extracted from the bank statement and the accounting records of the Sun Corporation for the month of July 2007:

1. Cash balance from books, July 31	\$1,967.35
2. Cash balance from bank, July 31	1,980.20
3. NSF check returned by bank with bank statement	81.00
4. Note collected by bank on July 31	190.00
5. Interest on preceding note	5.50
6. Bank service charge for July	4.40
7. Outstanding checks at end of July	150.00
8. Deposit in transit at end of July	247.25

**Required**

1. Prepare a bank reconciliation for the Sun Corporation for July 31, 2007.
2. Prepare the journal entries necessary to adjust Sun's books on July 31, 2007.

**E7-21 Bank Reconciliation and Adjusting Entries (Appendix)** The Odum Corporation's cash account showed a balance of \$17,198 on March 31, 2007. The bank statement balance for the same date indicated a balance of \$17,924.55. The following additional information is available concerning Odum's cash balance on March 31, 2007.

1. Undeposited cash on hand on March 31 amounted to \$724.50.
2. A customer's NSF check for \$173.80 was returned with the bank statement.
3. A note for \$2,000 plus interest of \$25 was collected for Odum by the bank during March. The bank notified Odum of this collection on the bank statement.
4. The bank service charge for March was \$15.
5. A deposit of \$951.75 mailed to the bank on March 31 did not appear on the bank statement.
6. The following checks mailed to creditors had not been processed by the bank on March 31:
 

#429	\$ 57.40	#433	\$214.80
#432	\$147.50	#434	\$191.90
7. A customer check for \$149.50 in payment of his account and listed correctly for that amount on the bank statement had been incorrectly recorded on the accounting records as \$194.50.

**Required** 

1. Prepare a bank reconciliation for the Odum Corporation for March 31, 2007.
2. Prepare any adjusting journal entries necessary to record the information from Requirement 1.

**E7-22 Computing the Bank Statement Balance (Appendix)** Your cashier I. Amakrook has notified you that he has misplaced all the bank statements for the past year. You decide to review selected accounting records during the year and discover that the following journal entry was made to reconcile the June 30, 2007 bank statement and the accounting records:

Accounts Receivable	1,520.24	
Miscellaneous Expense	12.50	
Notes Receivable		200.00
Interest Revenue		10.00
Cash		1,322.74

**Required**

1. What events might have caused each of the preceding reconciling items to occur?
2. Compute the amount that would have appeared as the balance per bank statement on a bank reconciliation if the preadjustment cash balance in the accounting records was \$7,683.70, outstanding checks were \$207.50, and no other adjustments were required.
3. Assume that you contact the bank and are informed that a balance of \$5,542.90 had been reported on the June 30, 2007 bank statement. What does this discrepancy indicate and how would you begin investigating it?

## PROBLEMS

**P7-1 Cash and Other Items** The following information has been extracted from the accounting records of the Atwood Corporation:

1. Cash on hand (undeposited sales receipts) \$ 1,020

2. Certificates of deposit	25,000
3. Customer's note receivable	1,000
4. Reconciled balance in University National Bank checking account	(350)
5. Reconciled balance in Second National Bank checking account	9,350
6. Balance in City Federal savings account	8,560
7. Customer's postdated check	1,350
8. Employee travel advances	1,600
9. Cash in bond sinking fund	1,200
10. Bond sinking fund investments	8,090
11. Postage stamps	430

**Required**

Determine the balance in Atwood's Cash account, and discuss the balance sheet treatment of any items not included as cash.

**P7-2 Analyzing Bad Debt Expense** In 2008, 3 years after it began operations, the Pearce Corporation decided to change from the direct write-off method of recording bad debts to estimating bad debts. The following information is available to you:

	Year			
	2005	2006	2007	2008
Sales	\$125,000	\$180,000	\$250,000	\$280,000
Credit sales	90,000	158,000	210,000	235,000
Collections on accounts receivable				
2005 sales	78,000	8,500	200	
2006 sales		137,000	15,000	300
2007 sales			178,800	19,500
2008 sales				200,000
Accounts receivable written off				
2005 accounts	2,500	500	300	0
2006 accounts		4,600	700	400
2007 accounts			6,200	1,000
2008 accounts				6,800

**Required**

- Prepare an analysis to determine Pearce's estimated bad debt expense percentage based upon the average relationship of actual bad debts to credit sales.
- Prepare an analysis to determine Pearce's estimated percentage of allowance for doubtful accounts based on year-end accounts receivable.
- What amount should Pearce record as bad debts expense for 2008 if:
  - Bad debts are estimated as a percentage of credit sales?
  - Allowance for doubtful accounts is estimated as a percentage of outstanding year-end accounts receivable?

**P7-3 Analyzing Accounts Receivable** The June 30, 2006 balance sheet of the Upham Company included the following information:

Accounts receivable	\$224,000	
Less: Allowance for doubtful accounts	<u>(14,100)</u>	\$209,900
Notes receivable*		<u>21,800</u>
Total receivables		\$231,700

\*The company is contingently liable for discounted notes receivable of \$38,000.

During the company's fiscal year ending June 30, 2007 the following transactions occurred:

1. Sales on credit	\$874,600
2. Collections of accounts receivable	841,000
3. Accounts receivable written off as uncollectible	13,800
4. Notes receivable collected	29,000
5. Customer notes received in payment of accounts receivable	72,000
6. Notes receivable discounted that were paid at maturity	36,000
7. Notes receivable discounted that were defaulted, including interest of \$20 and a \$5 fee. This amount is expected to be collected during the 2008 fiscal year	2,025
8. Proceeds from customer notes discounted with recourse (face value \$45,000, accrued interest revenue \$200)	45,075
9. Collections on accounts previously written off	500

10. Sales returns and allowances (on credit sales) 2,000  
 11. Bad debts were estimated to be 1.5% of credit sales

**Required**

1. Prepare journal entries necessary for Upham to record the preceding transactions.
2. Prepare an analysis and schedule that shows the amounts of the accounts receivable, allowance for doubtful accounts, notes receivable, and notes receivable dishonored accounts that will be disclosed on Upham's June 30, 2007 balance sheet.

**P7-4 Recording Note Transactions** The following information is extracted from the accounting records of the Tara Corporation:

May 1	Received a \$6,000, 12%, 90-day note from V. Leigh, a customer.
May 6	Received a \$9,000, 10%, 120-day note from C. Gable, a customer.
May 11	Discounted the Leigh and Gable notes with recourse at the bank at 13%. In addition, borrowed \$10,000 from the bank for 90 days at 12%. The bank remits the face value less the interest.
July 31	The July bank statement indicated that the Leigh note had been paid.
Sept. 4	Received notice that Gable had defaulted on the May 6 note. The bank charged a fee of \$10. Paid the amount due on the Gable note to the bank. Informed Gable to pay Tara the entire amount due plus 11% interest on the total of the face amount of the note, the accrued interest, and the fee from the maturity date until Gable remits the amount owed.
Sept. 23	Received the amount due from Gable.

**Required**

Prepare journal entries to record the preceding information, assuming that Tara usually does not discount its notes.

**P7-5 Reconstructing Accounts Receivable and Expense Journal Entries** The 2008 audit of the accounting records of the Lane Company discloses the following information:

	2007	2008
Accounts receivable (ending)	\$186,000	\$187,100
Allowance for doubtful accounts (ending)	7,400	7,000
Allowance for sales returns and allowances (ending)	4,700	3,916
Gross sales returns and allowances (estimated for the year)	4,900	5,200
Accounts receivable written off during the year	6,800	7,900
Estimated bad debts for the year	7,200	7,500
Actual gross sales returns and allowances for the year	4,700	6,000
Sales discounts not taken at end of year	0	400
Credit sales during the year (terms, 2/10, n/60)	375,000	380,000
Cash collected on accounts receivable during the year (net of discounts taken)	352,000	367,500

**Required**

1. Reconstruct the journal entries that were made by Lane during 2008 to record changes in the following accounts, assuming sales returns and allowances are estimated in the period of sale and the net price method is used to account for sales discounts.
  - a. Allowance for doubtful accounts
  - b. Allowance for sales returns and allowances
  - c. Accounts receivable
2. What is the 2008 ending balance in each of the accounts in Requirement 1 and how will it be reported on Lane's 2008 financial statements?

**P7-6 Cash Discounts** The Lambert Corporation sells merchandise at a list price of \$70,000 with accompanying terms of 2/10, n/30 on December 8, 2007. By December 18, 2007, Lambert had collected from customers for merchandise originally billed at \$46,000. By December 31, 2007, additional collections had been received on sales originally billed for \$18,000, and sales returns and allowances of \$1,500 had been granted by Lambert. By January 15, 2008, all the remaining balances due had been collected.

**Required**

1. Prepare the journal entries using (a) the gross price method and (b) the net price method to record each of the following items:
  - a. The sale of the merchandise
  - b. Collections received by December 18, 2007
  - c. Collections received by December 31, 2007
  - d. Sales returns and allowances (*not* estimated in the period of sale)
  - e. Any required year-end adjustments

- f. Any January 1, 2008 reversing entries
  - g. The collections received by January 15, 2008
2. Calculate the accounts receivable balance that would be reported under (a) the gross price method and (b) the net price method on the Lambert Corporation's December 31, 2007, balance sheet.

**P7-7 Aging Accounts Receivable** On September 30, 2007 (the end of its fiscal year), the Lufkin Corporation reported accounts receivable of \$331,750 and an allowance for doubtful accounts of \$16,700. During fiscal 2008 the following transactions occurred:

Credit sales (terms, n/EOM)	\$2,017,800
Collections on accounts receivable	1,956,000
Accounts receivable written off	16,200

On September 30, 2008 an aging of the accounts receivable balance indicated the following:

Age	Amount	Estimated Percentage Uncollectible
Under 30 days	\$169,250	0.8%
30–90 days	100,000	1.6
91–180 days	55,900	5.0
181–360 days	38,200	15.0
Over 360 days	14,000	40.0
	<u>\$377,350</u>	

#### Required

1. Prepare the journal entries necessary to record the credit sales, collections on account, write-off of accounts receivable, and the bad debts expense for Lufkin for fiscal 2008.
2. What are Lufkin's September 30, 2008 balances in Accounts Receivable and in its Allowance for Doubtful Accounts and how will they be disclosed on the September 30, 2008 balance sheet?
3. Compute Lufkin's receivables turnover in days, assuming a 360-day business year (as discussed earlier in the chapter and in the Appendix to Chapter 6). What is your evaluation of its collection policies?

**P7-8 Estimating Bad Debts** An examination of the accounting records of the Keegan Corporation disclosed the following information for 2007:

Cash sales	\$680,000
Net credit sales	527,000
Accounts receivable (12/31/07)	190,000
Allowance for doubtful accounts (12/31/07, prior to adjustment)	1,500 (debit)

Keegan wishes to examine the effect of various alternative bad debt estimation policies.

#### Required

1. Prepare the adjusting entry that would be required under each of the following methods:
  - a. Bad debts are estimated at 1.4% of total sales (net).
  - b. Bad debts are estimated at 3% of net credit sales.
  - c. Bad debts are estimated at 7.5% of gross accounts receivable.
  - d. An aging of accounts receivable indicates that half of the outstanding accounts will incur a 3% loss, a quarter will incur a 6% loss, the remaining quarter will incur a 20% loss.
2. Discuss the difference between the income statement and balance sheet approaches to estimating bad debts.

**P7-9 Notes Receivable and Notes Receivable Discounted** The following notes receivable transactions occurred for the Harris Company during the last three months of the current year. (Assume all notes are dated the day the transaction occurred.)

Oct. 9	Received a \$5,000, 12%, 60-day note from K. Weedon, a customer.
Oct. 12	Received a \$6,000, 10%, 90-day note from M. Black, a customer.
Oct. 15	Discounted the Weedon note with recourse at the bank at 14%.
Nov. 11	Discounted the Black note with recourse at the bank at 15%.
Nov. 16	Received an \$8,000, 12%, 60-day note from B. Butcher, a customer.
Nov. 20	Received a \$6,000, 11%, 120-day note from D. Goldman, a customer.
Dec. 1	Received a \$9,000, 13%, 60-day note from S. Lambert, a customer.
Dec. 8	Received notice that the Weedon note was paid at maturity.
Dec. 10	Discounted the Goldman note with recourse at the bank at 13%.

**Required**

1. Prepare journal entries to record the preceding note transactions and the necessary adjusting entries on December 31. (Assume that Harris does not normally discount its notes.)
2. Show how Harris Company's notes receivable would be disclosed on the December 31 balance sheet. (Assume these are the only note transactions encountered by Harris during the year.)

**P7-10 Assigning Accounts Receivable** The Furman Corporation entered into an assignment agreement with a finance company whereby Furman would be advanced 80% of all accounts assigned, less a \$2,000 service charge. During the year, \$300,000 of accounts receivable were assigned, \$220,000 collections were made on outstanding assigned accounts, and \$210,000 was remitted to the finance company. This remittance included interest charges of \$2,100. Sales returns and allowances on assigned accounts amounted to \$5,000.

**Required**

1. Prepare the journal entries necessary to record the preceding information.
2. Show how the preceding information would be reported on Furman's year-end balance sheet (assume the note payable is short-term).

**P7-11 Factoring Accounts Receivable** Faerber Textile Company frequently factors its accounts receivable. During 2007, Faerber made credit sales of \$100,000 to customers, under terms of 2/10, n/30. Faerber records its credit sales using the gross price method. From past experience, sales returns and allowances are expected to be minimal. In 2007, Faerber sold \$70,000 of these receivables to a factor. The factor remitted 90% of the accounts receivable factored and charged a 12% commission on the gross amount of the factored receivables. The factoring agreement also requires Faerber to be responsible for any cash discounts taken by customers upon payment of the factored receivables. Faerber is charged for these cash discounts upon reimbursement by the factor. During 2007, sales returns and allowances were \$3,000 on the factored accounts receivable and \$1,300 on the unfactored accounts receivable. The factor collected the remaining amount of the factored receivables, less the 2% discount on 94% of the collected receivables, and returned the balance owed to Faerber. Faerber collected the remaining amount of the unfactored accounts receivable, less the 2% discount on 96% of the collected receivables.

**Required**

Prepare all the journal entries necessary for Faerber to record the preceding information.

**P7-12 Factoring and Assignment of Accounts Receivable** The Lazard Corporation has experienced cash flow problems and decides to improve its current cash position by factoring 30% of its receivables and assigning the remainder with the same finance company. The agreement with the finance company stipulates that a 10% commission will be assessed on factored accounts and 15% annual interest will be charged on the outstanding note payable balance related to the assigned accounts. Additionally, the finance company will advance only 80% of the factored and assigned accounts, and Lazard must continue the collection responsibilities on the assigned accounts. At the beginning of the last month of the company's fiscal year, the accounts receivable transferred to the finance company amounted to \$187,000. During the month, collections on factored accounts were \$46,000, and collections on assigned accounts amounted to \$84,000. All collections on assigned accounts plus accrued interest were remitted to the finance company at the end of the month. The remaining amounts owed will be remitted within these months.

**Required**

1. Prepare all journal entries to record the preceding information on Lazard's books.
2. How would the accounts related to Lazard's factoring and assignment agreements be reported on Lazard's year-end financial statements?

**P7-13 AICPA Adapted Examination of Accounts Receivable** You are engaged in the annual examination of Faulane Company, a wholesale office supply business, for the year ended June 30, 2007. You have been assigned to examine the accounts receivable. The following information is available at June 30, 2007.

1. Your review of accounts receivable and discussions with the client disclose that the following items are included in the accounts receivable (of both the control and the subsidiary ledgers):
  - a. Accounts with credit balances total \$1,746
  - b. Receivables from officers total \$8,500
  - c. Advances to employees total \$1,411
  - d. Accounts that are definitely uncollectible total \$1,187
2. Uncollectible accounts are estimated to be 0.50% of the year's net credit sales of \$16,750,000.

**Required**

Prepare any journal entry (entries) required:

1. to reclassify items that are not trade accounts receivable,
2. to write off uncollectible accounts, and
3. to adjust the allowance for doubtful accounts.

**P7-14 AICPA Adapted** *Allowance for Bad Accounts* The Installment Jewelry Company has been in business for 5 years but has never had an audit made of its financial statements. Engaged to make an audit for 2007, you find that the company's balance sheet carries no allowance for bad accounts, bad accounts having been expensed as written off and recoveries credited to income as collected. The company's policy is to write off at December 31 of each year those accounts on which no collections have been received for 3 months. The installment contracts generally are for 2 years.

On your recommendation the company agrees to revise its accounts for 2007 to give effect to bad account treatment on the allowance basis. The allowance is to be based on a percentage of sales that is derived from the experience of prior years. Statistics for the past 5 years are shown in the following table:

	Charge Sales	Accounts Written Off and Year of Sale			Recoveries and Year of Sale
		(2003)			
2003	\$100,000	\$ 550			
		(2003)	(2004)		(2003)
2004	250,000	1,500	\$1,000		\$100
		(2003)	(2004)	(2005)	(2004)
2005	300,000	500	4,000	\$1,300	400
		(2004)	(2005)	(2006)	(2005)
2006	325,000	1,200	4,500	1,500	500
		(2005)	(2006)	(2007)	(2006)
2007	275,000	2,700	5,000	1,400	600

Accounts receivable at December 31, 2007 were as follows:

2006 Sales	\$ 15,000
2007 Sales	<u>135,000</u>
	<u>\$150,000</u>

#### Required

Prepare the adjusting journal entry or entries with appropriate explanations to set up the Allowance for Bad Accounts. (Support each item with organized computations; income tax implications should be ignored.)

**P7-15 AICPA Adapted** *Allowance for Doubtful Accounts* From inception of operations to December 31, 2006, Harris Corporation provided for uncollectible accounts receivable under the allowance method: Provisions were made monthly at 2% of credit sales; bad debts written off were charged to the allowance account; recoveries of bad debts previously written off were credited to the allowance account; and no year-end adjustments to the allowance account were made. Harris's usual credit terms are net 30 days.

The balance in the Allowance for Doubtful Accounts was \$130,000 at January 1, 2007. During 2007, credit sales totaled \$9,000,000, interim provisions for doubtful accounts were made at 2% of credit sales, \$90,000 of bad debts were written off, and recoveries of accounts previously written off amounted to \$15,000. Harris upgraded its computer facility in November 2007 and an aging of accounts receivable was prepared for the first time as of December 31, 2007. A summary of the aging is as follows:

Classification by Month of Sale	Balance in Each Category	Estimated % Uncollectible
Nov.–Dec. 2007	\$1,140,000	2%
July–Oct.	600,000	10
Jan.–June	400,000	25
Prior to 1/1/07	<u>130,000</u>	75
	<u>\$2,270,000</u>	

Based on the review of collectibility of the account balances in the "prior to 1/1/07" aging category, additional receivables totaling \$60,000 were written off as of December 31, 2007. Effective with the year ended December 31, 2007, Harris adopted a new accounting method for estimating the allowance for doubtful accounts at the amount indicated by the year-end aging analysis of accounts receivable.

#### Required

1. Prepare a schedule analyzing the changes in the allowance for doubtful accounts for the year ended December 31, 2007. Show supporting computations in good form.
2. Prepare the journal entry for the year-end adjustment to the Allowance for Doubtful Accounts balance as of December 31, 2007.

**P7-16 AICPA Adapted Correction of Allowance Account** From inception of operations in 2004 Summit carried no allowance for doubtful accounts. Uncollectible receivables were expensed as written off, and recoveries were credited to income as collected. On March 1, 2008 (after the 2007 financial statements were issued), management recognized that Summit's accounting policy with respect to doubtful accounts was not correct, and determined that an allowance for doubtful accounts was necessary. A policy was established to maintain an allowance for doubtful accounts based on Summit's historical bad debt loss percentage applied to year-end accounts receivable. The historical bad debt loss percentage is to be recomputed each year based on the relationship of net write-offs to credit sales for all available past years up to a maximum of five years.

Information from Summit's records for five years is as follows:

Year	Credit Sales	Accounts Written Off	Recoveries
2004	\$1,500,000	\$15,000	\$ 0
2005	2,250,000	38,000	2,700
2006	2,950,000	52,000	2,500
2007	3,300,000	65,000	4,800
2008	4,000,000	83,000	5,000

Accounts receivable balances were \$1,250,000 and \$1,460,000 at December 31, 2007 and December 31, 2008 respectively.

#### Required

1. Prepare the journal entry, with appropriate explanation, to set up the Allowance for Doubtful Accounts as of January 1, 2008. Disregard income taxes. Show supporting computations in good form.
2. Prepare a schedule analyzing the changes in the Allowance for Doubtful Accounts account for the year ended December 31, 2008. Show supporting computations in good form.

**P7-17 Comprehensive Receivables Problem** The December 31, 2006 balance sheet of the Blackmon Corporation disclosed the following information relating to its receivables:

Accounts receivable	\$245,000	
Less: Allowance for doubtful accounts	<u>(15,000)</u>	
		\$230,000
Notes receivable*		<u>50,000</u>
Total receivables		<u>\$280,000</u>

\*The company is contingently liable for a discounted note receivable of \$10,000.

During 2007, credit sales (terms, n/EOM) totaled \$2,200,000 and collections on accounts receivable (unassigned) amounted to \$1,900,000. Uncollectible accounts totaling \$18,000 from several customers were written off, and a \$1,350 accounts receivable previously written off was collected. Additionally, the following transactions relating to Blackmon's receivables occurred during the year:

- Mar. 6 Received payment of \$12,460 on a note from the Renko Company. The payment included interest revenue of \$460.
- Mar. 31 The March bank statement indicated that the discounted note had been paid at maturity.
- May 1 Accepted a 120-day, 13% note from the Licata Company in exchange for its account receivable of \$4,800.
- May 18 Received a \$6,900, 90-day, 12% note from the Eagle Manufacturing Corporation for a credit sale.
- June 2 Discounted both the Licata and Eagle notes with recourse at the bank at 14% (assume that Blackmon normally does not discount its notes).
- July 1 Assigned \$140,000 of accounts receivable to a finance company. Under the terms of the agreement, Blackmon receives 85% of the value of the accounts assigned, less a service charge of \$5,000, and is charged 1.5% per month on the outstanding loan balance.
- July 6 A sales allowance of \$2,500 on an assigned account is allowed by Blackmon.
- July 13 A sales return of \$800 on an assigned account is granted by Blackmon.
- July 31 Collections of \$50,000 are made on assigned accounts. This amount and 1 month's interest are remitted to the finance company.
- Aug. 31 Assigned accounts of \$60,000 are collected, and the remainder of the loan is repaid, including interest.

- Aug. 31 The August bank statement indicated the Eagle note had been paid.
- Sept. 1 The bank notifies Blackmon that Licata defaulted on its note and charges a fee of \$25.
- Sept. 4 Collected the amount due from the Licata Company.
- Dec. 31 Collected interest of \$5,000 on the outstanding notes receivable.

On December 31, 2007 an aging of the accounts receivable balance indicated the following:

Age	Amount	Estimated Percentage Uncollectible
Under 30 days	\$240,487	0.5%
31–60 days	113,421	1.5
61–90 days	30,933	8.0
91–240 days	17,185	35.0
Over 240 days	6,874	70.0
	<u>\$408,900</u>	

#### Required

- Prepare the journal entries to record the preceding receivable transactions during 2007 and the necessary adjusting entry on December 31, 2007.
- Prepare the receivables portion of Blackmon's December 31, 2007 balance sheet.
- Compute Blackmon's accounts receivable turnover in days, assuming a 365-day business year (as discussed earlier in the chapter and in the Appendix to Chapter 6). What is your evaluation of its collection policies?

**P7-18 Reconciliation of Bank and Company Cash Amounts (Appendix)** The December 31, 2007 bank statement for Miller Corporation showed a \$2,049.25 balance. On this date the company's Cash account reflected a \$325.60 overdraft. In reconciling these amounts, the following information is discovered:

- Cash on hand for undeposited sales receipts, December 31, 2007, \$130.25.
- Customer NSF check returned with bank statement, \$420.40.
- Cash sales of \$640.25 for the week ended December 18, 2007 were recorded on the books. The cashier reports this amount missing, and it was not deposited in the bank.
- Note receivable of \$2,500 and interest of \$25 collected by the bank and not recorded on the books.
- Deposit in transit December 31, 2007, \$350.00.
- A customer check for \$290.40 in payment of its account was recorded on the books at \$940.20.
- Outstanding checks, \$2,040.55. Includes a duplicate check of \$70.85 to C. Brown, who notified Miller that the original was lost. Miller stopped payment on the original check and has already adjusted the cash account in the accounting records for this amount.

#### Required

- Prepare a December 31, 2007 bank reconciliation for Miller.
- Prepare any journal entries necessary by Miller to record the information from Requirement 1.

**P7-19 Unknown Book Balance (Appendix)** The following information pertains to the Cash account of the Nakamoto Corporation for the month of July 2007:

#### Bank statement

Balance July 31	\$22,639.54
Service charge for July	15.00
NSF check returned with July bank statement	184.50
Note receivable collected by bank (not previously recorded on the books)	2,000.00
Interest on note collected by bank (not previously recorded on the books)	60.00

#### Books

Balance July 31	?
Cash on hand awaiting deposit	1,824.42
Outstanding checks:	
#257 \$42.17	
#271 \$120.19	
#272 \$80.82	
Deposit in transit	2,420.98

**Required** 

1. Prepare a bank reconciliation to determine Nakamoto's adjusted cash balance on July 31, 2007.
2. Determine Nakamoto's unadjusted cash balance (per books) on July 31, 2007.
3. Prepare the adjusting entries necessary to bring Nakamoto's cash account balance up to date on July 31, 2007.

**P7-20 Bank Reconciliation (Appendix)** The Daisy Company received a bank statement for February 2007, as follows:

From: Central Bank, Denver, Co. 80222

To: Daisy Company, 1313 Williams St., Denver, Co. 80218

Date	Checks	Deposits	Balance
Feb. 1			\$4,524.80
7	\$2,700.33	\$8,642.61	
9	3,484.81		
14	6.00 SC	460.00 CM	
16	274.09		
21	4,133.60	3,385.49	
23	69.69 NSF		
28			\$6,344.38
	SC 5 Service Charge	NSF 5 Check Returned	
	CM 5 Credit Memo	DM 5 Debit Memo	

The receipt of \$460 on February 14 was for a \$445 note collected by the bank, plus \$20 current interest, less a \$5 service charge. The company's accounting records contained the following information:

Cash balance on February 28 from the books: \$2,610.42

Cash Disbursements		Cash Receipts	
Check No. 155	\$2,700.33	Feb. 7	\$8,624.61
156	3,484.81	21	3,385.49
157	274.09	All receipts are verified and correct	
158	589.02		
159	4,133.60		
160	2,742.63		

**Required**

1. Prepare a bank reconciliation on February 28, 2007 for the Daisy Company.
2. Prepare the journal entries that the Daisy Company should record as a result of the reconciliation.

**P7-21 AICPA Adapted Comprehensive Reconciliation (Appendix)** In auditing the Train Company, you obtain directly from the bank Train's bank statement, canceled checks, and other memoranda which relate to the company's bank account for December 2007. In reconciling the bank balance on December 31, 2007 with that shown on the company's books, you observe the following facts:

1. Balance per bank statement		\$91,174.63
2. Balance per books		59,088.46
3. Outstanding checks, 12/31/07		33,378.82
4. Receipts of 12/31/07 deposited on 1/1/08		5,317.20
5. Service charge for December		22.50
6. Proceeds of bank loan, 12/15/07 omitted from company records (discounted for 3 months at 12% per year)		11,640.00
7. Deposit of 12/20/07 omitted from the bank statement		2,892.41
8. Check of Rome Products Co. charged back on 12/22/07 for lack of countersignature. Redeposited 1/5/08. No entry was made for the chargeback or the redeposit.		873.74
9. Error on bank statement in entering deposit of 12/18/07:		
Correct amount	\$3,182.40	
Entered in statement	<u>3,181.40</u>	1.00
10. Check No. 3917 of Trait Manufacturing Co. charged in error to company's account		2,690.00

11. Proceeds of note of J. Somers & Co. collected by bank 12/11/07 not entered on books:		
Principal	\$2,000.00	
Interest	<u>40.00</u>	
	\$2,040.00	
Less: collection charge	<u>5.00</u>	2,035.00
12. Erroneous debit memo of 12/22/07 to charge company's account with settlement of bank loan, which was paid by check No. 8714 on same date		5,000.00
13. Error on bank statement in entering deposit of 12/4/07		
Entered as	\$4,817.10	
Correct amount	<u>4,807.10</u>	10.00
14. Deposit of Trait Manufacturing Co. of 12/8/07 credited in error to the company		1,819.20

**Required**

1. Prepare a reconciliation of the Train Company's bank account.
2. Prepare journal entries to adjust the Train Company's books to reflect the correct bank balance on December 31, 2007.

**CASES****COMMUNICATION****C7-1 Cash Management**

The president of Poor Corporation, who likes to have large balances of cash on hand, has recently been reading articles in highly respected financial magazines about very successful businesses. The president noticed that each company stressed the importance of cash management and internal control in making it a success. The president of Poor Corporation comes to you, the accountant, and asks you to explain the concept of cash management.

**Required**

Explain the concept of cash management, including the two major subdivisions and their components.

**C7-2 Bad Debt Expense**

**AICPA Adapted** When a company has a policy of making sales for which credit is extended, it is reasonable to expect a portion of those sales to be uncollectible. As a result of this, a company must recognize bad debt expense. There are basically two methods of recognizing bad debt expense: (1) direct write-off method, and (2) allowance method.

**Required**

1. Describe fully both the direct write-off method and the allowance method of recognizing bad debt expense.
2. Explain the reasons why one of these methods is preferable to the other and the reasons why the other method is not usually in accordance with generally accepted accounting principles.

**C7-3 Accounts Receivable**

The Moore Company is undergoing a period of financial stress due to the depressed economy. The company is in

desperate need of cash. The only liquid asset that the company holds is \$500,000 of accounts receivable.

**Required**

1. Explain the various types of arrangements that may be used to obtain cash from outstanding accounts receivable.
2. Indicate how each method should be disclosed in the financial statements.
3. If Moore Company decides to sell its accounts receivable, should it account for the transfer as a pledge or a factoring agreement? Why?

**C7-4 Receivables Issues**

**AICPA Adapted** Magrath Company has an operating cycle of less than one year and provides credit terms for all of its customers. On April 3, 2007, the company factored, without recourse, some of its accounts receivable.

On August 1, 2007, Magrath sold special order merchandise and received an interest-bearing note due April 30, 2008.

Magrath uses the allowance method to account for uncollectible accounts. During 2007, some accounts were written off as uncollectible, and other accounts previously written off as uncollectible were collected.

**Required**

1. Explain how Magrath should account for and report the accounts receivable factored on April 3, 2007. Why is this accounting treatment appropriate?
2. Explain how Magrath should report the effects of the interest-bearing note on its income statement for the year ended December 31, 2007 and its December 31, 2007 balance sheet.

3. Explain how Magrath should account for the collection of the accounts previously written off as uncollectible.
4. What are the two basic approaches to estimating uncollectible accounts under the allowance method? What is the rationale for each approach?

### C7-5 Bank Reconciliations (Appendix)

A discrepancy usually will exist between a company's bank statement balance and its cash records due to the time lag associated with the use of a checking account. The time lag results in many transactions being recorded on the company's records prior to their appearance on the bank statement. The bank statement balance and the cash records must be brought into agreement to determine their accuracy. This result can be achieved by using a bank reconciliation.

#### Required

Prepare a written report that explains a bank reconciliation.

### C7-6 Lockbox Account Bank Reconciliation (Appendix)

DGK Company maintains a lockbox account to facilitate the collection of its accounts receivable. All of the company's cash receipts from credit sales are sent directly to a post office box held in the company's name, which is accessed directly by bank personnel. Each day the bank processes the receipts, credits DGK's account, and provides the company with a hard copy package, which includes a detail and summary listing of all checks deposited, copies of actual checks, invoices,

enclosures, and envelopes. The company usually receives its hard copy packages a day after the bank has processed the receipts.

In addition, DGK Company has authorized the bank to apply "collected balances" (balances for which the holding period allowed for collection and return of deposited items has elapsed) directly against the company's outstanding line of credit with the bank, unless instructed otherwise by the company. The company receives hard copy notices of amounts applied, generally within two business days.

The accounting records for DGK Company contain the following details for December 2007:

1. Balance per bank for the lockbox account, 12/31/07	\$55,000
2. Balance per books, 12/31/07	50,050
3. Deposit in transit from cash sales	5,000
4. Lockbox receipts, 12/31/07	30,000
5. Collected balances applied to line of credit on 12/31/07	20,000
6. Bank service charge for December	50
7. No checks are drawn on the lockbox account	

#### Required

1. Explain how a lockbox account might benefit a company.
2. Prepare a December 31, 2007 bank reconciliation of DGK Company's lockbox bank account.
3. Prepare any journal entries necessary to adjust DGK Company's books to reflect the results of the reconciliation performed in Requirement 2. (*Contributed by Daryl G. Krause.*)

## CREATIVE AND CRITICAL THINKING

### C7-7 Components of Cash

**AICPA Adapted** Cash is an important asset of a company.

1. What are the normal components of cash?
2. Under what circumstances, if any, do valuation problems arise in connection with cash?

### C7-8 Estimated Bad Debts

**AICPA Adapted** On December 31, 2007, Carme Company had significant amounts of accounts receivable as a result of credit sales to its customers. Carme Company uses the allowance method based on credit sales to estimate bad debts. Based on past experience, 1% of credit sales normally will not be collected. This pattern is expected to continue.

#### Required

1. Explain the rationale of using the allowance method based on credit sales to estimate bad debts. Contrast this method with the allowance method based on the balance in the trade receivables accounts.
2. Explain how Carme Company should report the allowance for bad debts account on its balance sheet at December 31, 2007. Also, describe the alternatives, if any, for presentation of bad debt expense in Carme Company's 2007 income statement.

### C7-9 Cash Discounts

In order to induce prompt payment, the Swope Company offers a cash discount of 2% to customers who make payment on their account within 10 days of the invoice date. The company's bookkeeper is not sure how these discounts should be recorded.

#### Required

1. Explain the methods of recording accounts receivable with cash discounts.
2. Discuss the theoretical soundness of each method.

### C7-10 Assignment and Factoring

**AICPA Adapted** Marie Company has significant amounts of trade accounts receivable as a result of credit sales to its customers. On October 2, 2007, some trade accounts receivable were assigned to Daniel Finance Company on a with-recourse, nonnotification basis for an advance of 75% of their amount at an interest charge of 20% on the balance outstanding.

On November 3, 2007, other trade accounts receivable were factored on a without-recourse basis. The factor withheld 5% of the trade accounts receivable factored as protection against sales returns and allowances and charged a finance charge of 3%.

**Required**

1. How should Marie account for subsequent collections on the trade accounts receivable assigned on October 2, 2007, and the payments to Daniel Finance? Why?
2. How should Marie account for the trade accounts receivable factored on November 3, 2007? Why?

**C7-11 Receivables Issues**

**AICPA Adapted** Hogan Company uses the net method of accounting for sales discounts. Hogan also offers trade discounts to various groups of buyers. On August 1, 2007, Hogan factored some accounts receivable on a without-recourse basis. Hogan incurred a finance charge.

Hogan also has some notes receivable bearing an appropriate rate of interest. The principal and total interest are due at maturity. The notes were received on October 2, 2007, and mature on October 1, 2008. Hogan's operating cycle is less than one year.

**Required**

1. Using the net method, how should Hogan account for the sales discounts at the date of sale? What is the rationale for the amount recorded as sales under the net method?
2. a. Using the net method, what is the effect on Hogan's sales revenues and net income when customers do not take the sales discounts?  
b. What is the effect of trade discounts on sales revenues and accounts receivable? Why?  
c. How should Hogan account for the accounts receivable factored on August 1, 2007? Why?  
d. How should Hogan report the effects of the interest-bearing notes receivable on its December 31, 2007 balance sheet and on its income statement for the year ended December 31, 2007? Why?

**C7-12 Assignment and Discounting**

**AICPA Adapted** Tidal Company has significant amounts of trade accounts receivable. In March of this year, Tidal assigned specific trade accounts receivable to Herb Finance Company on a with-recourse, nonnotification basis as collateral for a loan. Tidal signed a note and received 70% of the amount assigned. Tidal was charged a 5% finance fee and agreed to pay interest at 12% on the unpaid balance. Some specific accounts of the assigned receivables were written off as uncollectible. The remainder of the trade accounts receivable assigned were collected by Tidal in March and April of this year. Tidal paid Herb Finance in full at the end of April of this year.

Tidal also sold some special order merchandise and received a 90-day, 10%, interest-bearing note receivable on July 1 of this year. After 30 days, the note receivable was discounted with recourse at 14% at a bank.

**Required**

1. Explain how Tidal should account for the transactions described here for the assignment of trade accounts receivable.

2. a. Explain how Tidal should determine the amount of the discount for the note receivable.  
b. Explain how the discounting transaction should be accounted for.

**C7-13 Analyzing Coca-Cola's Cash and Receivables Disclosures**

Refer to the financial statements and related notes of the Coca-Cola Company in Appendix A of this book.

**Required**

1. What were the cash and cash equivalents at the end of 2004? What does the company classify as cash equivalents?
2. What were the trade accounts receivable (net) at the end of 2004? At the end of 2003?
3. Assuming that all net operating revenues were net credit sales and that the trade accounts receivable (net) at the end of 2002 were \$2,097 million, compute the receivables turnover for 2004 and 2003. What is your evaluation of the difference?

**C7-14 Ethics and Sales Returns**

At the end of 2007, the accounting firm for which you work is auditing the books of Debitus Publishing Inc. for the first time. Debitus, a calendar year company, publishes textbooks that are used in colleges and universities across the country. These textbooks are purchased by students through their campus bookstores. Debitus normally makes its biggest sales at the beginning of the fall semester. In the past, Debitus has always recorded sales returns in the spring semester when the campus bookstores return any unsold textbooks. This has been satisfactory because the returns have been immaterial in amount.

In 2006, as a promotional strategy to stimulate sales, Debitus began offering bookstores a reduced price if they ordered more textbooks. There is no penalty for returns of these textbooks if the bookstores cannot sell them to customers. This strategy worked; sales increased by 10% during 2006. In early 2007, however, a substantial amount of unsold textbooks were returned by bookstores to Debitus. Continuing the promotional strategy, sales increased by 15% during 2007.

While reviewing the sales returns account for 2007, you notice that the only entry was for the textbooks returned earlier in the year. You note that these returns amounted to about 5% of the sales for the fall semester of 2006. Since this pattern of returns seems to you to be a trend that will continue, you raise the issue with the company controller as to whether all of the "sales" for the fall semester of 2007 are actually revenue. The controller responds, "Of course they are revenue; we sold the textbooks. Just because there will be some returns doesn't mean we haven't made sales. Besides, we don't know what percentage the returns will be; they might be as much as 5 percent, but definitely not more. Furthermore, we have already recorded all those returns at the beginning of 2007 that really applied to 2006. So we already have recorded our fair share of returns for 2007. As

long as we record returns consistently, it will all work out. We don't want a drop in earnings for 2007 because of a change in customer returns; our shareholders wouldn't like that. Let's just leave this issue alone."

**Required**

From financial reporting and ethical perspectives, what do you think about Debitus Publishing Inc.'s policy in regard to sales returns?

## RESEARCH SIMULATION

### R7-1 Researching GAAP

**Situation**

Hamilton Company operates in an industry with numerous competitors. It is experiencing a shortage of cash and decides to obtain money from a large bank by using some of its receivables as collateral. Hamilton pledges \$100,000 of its receivables, is charged a 12% fee on this amount, and notifies these credit customers to make their payments directly to the bank. Hamilton transfers the receivables to the bank and the bank assumes the servicing activities, but Hamilton is responsible for all bad debts, which it reasonably estimates to be 2% of the receivables amount. When the balance of the

receivables pledged is reduced to \$3,000, Hamilton is required to "repurchase" the receivables, notify the remaining credit customers to make payments to it, and reassume the servicing activities. The bank has the right to sell the receivables, except to Hamilton's major competitor. Hamilton's president has asked you how to account for (and record) this transaction.

**Directions**

Research the related generally accepted accounting principles and prepare a short memo to the president that answers his question. Cite your reference and applicable paragraph numbers.

## 8

## OBJECTIVES

After reading this chapter, you will be able to:

- 1 Describe how inventory accounts are classified.
- 2 Explain the uses of the perpetual and periodic inventory systems.
- 3 Identify how inventory quantities are determined.
- 4 Determine the cost of inventory.
- 5 Compute ending inventory and cost of goods sold under specific identification, FIFO, average cost, and LIFO.
- 6 Explain the conceptual issues regarding alternative inventory cost flow assumptions.
- 7 Understand dollar-value LIFO.
- 8 Explain additional LIFO issues.
- 9 Understand inventory disclosures.
- 10 Record foreign currency transactions involving inventory (Appendix).

# Inventories: Cost Measurement and Flow Assumptions

## Keep Your Eye on the Ball

Effective management and control of inventory is critical to the profitability and overall performance of many companies. For example, **Wal-Mart** executives closely monitor the \$26.612 billion of inventory reported in its 2004 annual report. With approximately 25% of its total assets represented by inventory, the level of inventory has widespread effects on its financial performance.

Management of inventory involves widespread tasks such as making sure that a company has sufficient quantities of the right items, controlling shrinkage (the reduction of inventory because of theft or loss), and evaluating the impact of interest costs related to the debt financing of inventory. Company executives realize that effective inventory management may be the difference between operating success and failure. To enhance inventory management, Wal-Mart has begun implementing radio frequency identification (RFID), a scanning technology similar to bar codes that allows inventory to be tracked from the supplier to the final customer, and promises dramatic reductions in inventory losses.

In addition to merchandising companies such as Wal-Mart, manufacturing companies, such as **General Mills**, also face special challenges in management of its inventory. Proper inventory management can allow managers to achieve significant operational efficiencies and economies of scale. A well-functioning inventory system allows managers to take advantage of quantity

Credit: RICHARD SFEINWALD/Bloomberg News/Landov

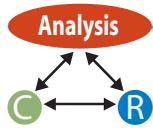

discounts in the purchase of inventory, increase productivity, and lower manufacturing costs through the scheduling of longer production runs. However, given the demand and supply uncertainties that exist in business, inventory also serves as a buffer to ensure that adequate goods exist that allow management to maintain desired service levels. Inventory decisions are not made in isolation. Because General Mills sells large amounts of inventory to Wal-Mart, the two companies are “partners” that have inevitable conflicts. For example, General Mills would like to deliver its products as soon as they are manufactured; however, Wal-Mart would prefer to receive the items when they are ready to put them on store shelves. The resolution of these intercompany conflicts is also a consideration in effective inventory management. Whether your company is a manufacturer or a merchandiser, inventory is something that will be watched closely.

## FOR FURTHER INVESTIGATION

For a discussion of recent innovations in inventory management, consult the Business & Company Resource Center (BCRC):

- “Radio Frequency Identification: The Wave of the Future,” Harold E. Davis and Michael S. Luehlfing, *Journal of Accountancy*, 0021-8448, November 2004, v198, i5, p43–49.
- “NCR Corp.’s Retail-Checkout Technology Likely to Shape Future of Shopping,” *Knight Ridder/Tribune Business News*, September 20, 2004.

Inventories are assets of a company that are (1) held for sale in the ordinary course of business, (2) in the process of production for sale, or (3) held for use in the production of goods or services to be made available for sale. Inventory specifically *excludes* any assets that a company does not sell in the normal course of business, such as marketable securities, or property, plant, and equipment that the company intends to sell.

Accounting for inventories is important because the purchase, manufacture, and sale of products are critical to the profitability of many companies. The cost (carrying value) of the inventory usually has a material effect on a company's balance sheet. Since the ending inventory of one period is the beginning inventory of the next period, the cost of the inventory on a company's balance sheet will have an effect on its cost of goods sold and net income of the next period. In addition, various accounting practices, such as alternative cost flow assumptions and valuation principles, are widely used and may have a significant effect on asset valuation and income determination. In this chapter we discuss the classifications of inventory, the perpetual and periodic inventory systems, the determination of inventory quantities and costs, and alternative inventory cost flow assumptions.

## CLASSIFICATIONS OF INVENTORY

- 1 Describe how inventory accounts are classified.

A company may use several different accounts to classify inventory, depending on its business. A merchandising company, whether wholesale or retail, purchases goods for resale and *does not* alter their physical form. Consequently, it needs only one type of inventory account, usually called (**merchandise**) **inventory**. A manufacturing company *does* change the physical form of the goods and typically uses three inventory accounts, usually called **raw materials inventory**, **work in process inventory**, and **finished goods inventory**. We show the flow of inventory costs for these two types of companies in Exhibit 8-1. We discuss the three categories of inventory accounts used by a manufacturing company in the following sections. Both types of companies may use more accounts internally, and may combine account balances in their financial statements.

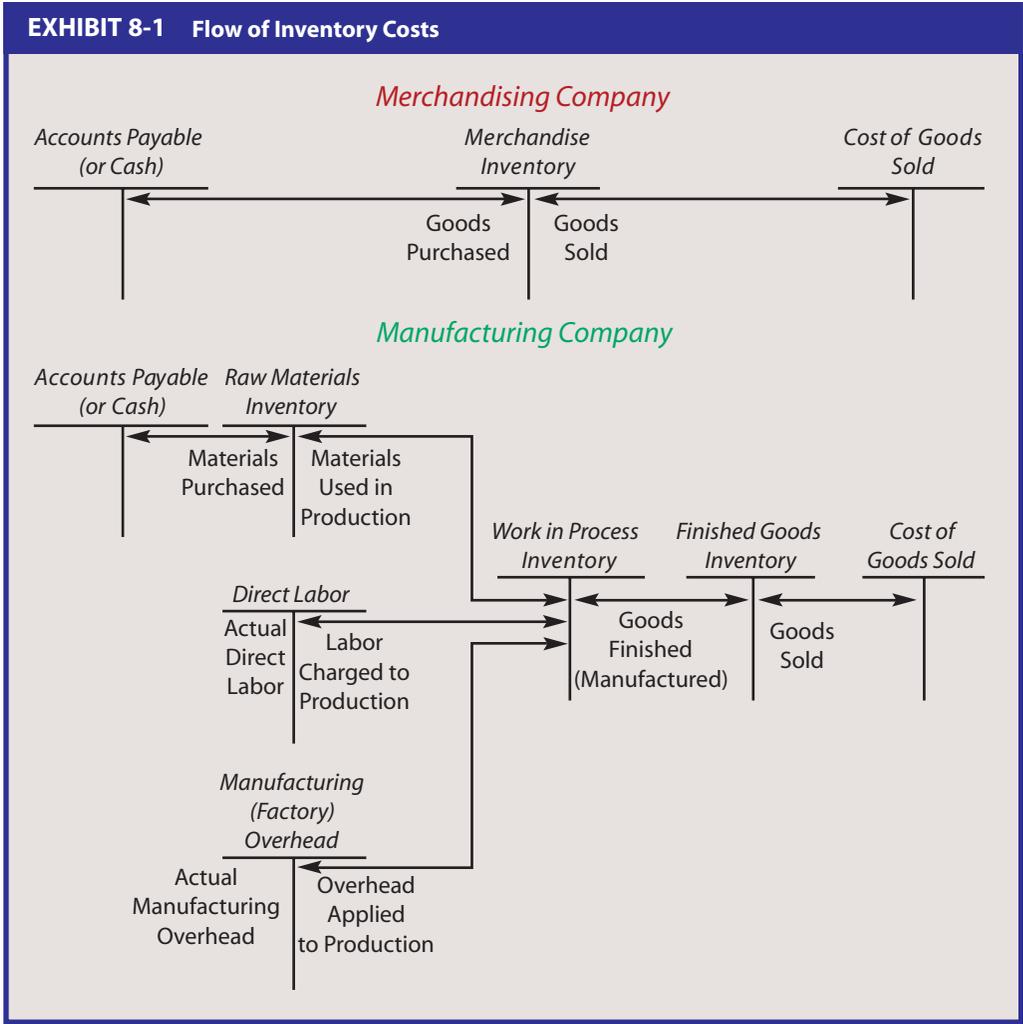

### Raw Materials Inventory

**Raw materials inventory** includes the **tangible goods** acquired for **direct use in the production process**. This inventory includes materials that a company acquired from natural sources, such as the iron ore used by a steel mill. Raw materials also may include products purchased from other companies, such as the steel or subassemblies used in the manufacture of appliances. Raw materials are different from **parts inventory**, which is the term often used for the inventory of replacement parts.

Sometimes, a company includes in raw materials inventory those materials that are not directly a part of its manufacturing process but are needed for its successful operation. However, the company often includes them in an account called **factory supplies**, **manufacturing supplies**, or **indirect materials**. Examples of materials in this category include lubricating oil and cleaning supplies.

### Work in Process Inventory

**Work (or goods) in process inventory** includes the **products that are started in the manufacturing process but are not yet complete**. This partially completed inventory includes three cost components: (1) raw materials, (2) direct labor, which is the cost of the labor used directly in the manufacture of the product, and (3) manufacturing (or factory) overhead, which includes the costs other than raw materials and direct labor that are part of the manufacturing process. These latter costs include **variable manufacturing overhead**, such as supplies and some indirect labor, and **fixed manufacturing overhead**, such as insurance, utilities, and depreciation on the assets used in the production activities.

### Finished Goods Inventory

Finished goods inventory includes the completed manufactured products awaiting sale. The inventory includes the same three cost components as the work in process inventory, but all the costs are combined into a single cost per unit for all the completed units.

### Reporting Inventory in a Company's Financial Statements

A company reports the cost of the inventory that it sold as cost of goods sold on its income statement, and deducts the amount from net sales to determine its gross profit. A company reports the cash it paid to purchase or produce its inventory in the operating activities section of its statement of cash flows. The inventory cost that a company reports on its balance sheet is the final amount that results from a series of steps. First the company must decide what items to include in the inventory and count the physical inventory quantities. Then it must determine the costs of the units it purchased or produced during the accounting period, taking into consideration the costs for freight-in and the reductions for purchases discounts, returns, and allowances. The company uses a cost flow assumption to allocate the costs of the beginning inventory plus the units purchased or produced during the year between the ending inventory and the cost of goods sold. We discuss each of these steps in the following sections.

## Inventories of Service Companies

A service company generally doesn't have a physical inventory. However, it often has an "inventory" of services that it has provided but not yet billed. For example, a company that provides computer consulting services will pay its employees each period but may only bill its services when certain "contract milestones" are reached. The company has an inventory of "unbilled services provided" that it reports as an asset, and then recognizes as an expense when it recognizes the revenue.

## ALTERNATIVE INVENTORY SYSTEMS

A company may account for inventory quantities and costs using either the **perpetual system** or the **periodic system**.

2 Explain the uses of the perpetual and periodic inventory systems.

### Perpetual Inventory System

A company using a perpetual system keeps a continuous record of the physical quantities in its inventory. It records the purchase, or production, and use of each item of inventory in detailed subsidiary records, although it often only records units without including costs. A perpetual physical system allows management to plan and control the inventory and avoid stock-outs. To help inventory control and the preparation of periodic financial statements, many perpetual systems also include costs. Such systems are becoming much more common with today's computer-based accounting systems. For example, most retail stores use "point of sale" cash register systems in which each product has a unique code, such as the UPC code, that is entered into the system as each unit is sold. Some companies are adopting radio frequency identification technology (RFID) to track inventory by attaching RFID tags. Both UPC codes and RFID tags enable the retailer to immediately update its Inventory and Cost of Goods Sold accounts as each sale is made. A company maintains these accounts as summary accounts, which makes it possible to know the inventory and the cost of goods sold at all times. The company usually records purchases returns and allowances, purchases discounts taken, and freight-in in separate accounts that it uses to compute the income for the period.

When a company uses a perpetual system, it should take a physical count at least once a year to confirm the balance in the inventory account. Any difference between the physical count and the inventory account balance results from errors in recording, shrinkage, waste, breakage, theft, and other causes. The company adjusts its inventory account and also increases cost of goods sold (or recognizes a loss) for the cost of the difference in the two quantities so that the perpetual records are in agreement with the physical count. The size of the difference provides useful information for inventory control purposes and is another advantage of the perpetual system.

### Periodic Inventory System

A company using a periodic system does *not* maintain a continuous record of the physical quantities (or costs) of inventory on hand. It takes physical counts periodically, which should be at least once a year and generally at the end of the year. This is the only time(s) when it knows the physical quantities on hand, and therefore the quantities used or sold during the period. The company determines the cost of the ending inventory by assigning costs to the physical quantities on hand based on the cost flow assumption it is using. Then it calculates the cost of goods sold by subtracting the ending inventory from the cost of goods available for sale. The cost of goods available for sale is the sum of the beginning inventory and either the net purchases for a merchandising company or the costs of the units produced for the period for a manufacturing company. This system is adequate for relatively low cost inventory items, particularly when the costs of a perpetual inventory system are likely to be greater than its benefits.

In the periodic system, a company typically does not record (debit) the costs of the purchases of inventory in an inventory account. This would lead to an overstatement of the permanent Inventory account, because the company does not reduce (credit) the account during the period for the cost of the inventory sold. Therefore, in a periodic system the company usually records (debits) costs of purchases of inventory in a temporary account, Purchases, while the beginning inventory cost remains in the Inventory account.

In both the perpetual and periodic systems, the company usually records purchases returns and allowances, purchases discounts taken, and freight-in in separate accounts. It uses each of these amounts in the computation of net purchases as follows:

$$\text{Net Purchases} = \text{Purchases} + \text{Freight-in} - \text{Purchases Returns and Allowances} - \text{Purchases Discounts Taken}$$

In summary, the difference between a perpetual and a periodic inventory system may be illustrated by the following equations:

*Perpetual Inventory System*

$$\text{Beginning Inventory} + \text{Purchases (net)} - \text{Goods Sold} = \text{Ending Inventory}$$

*Periodic Inventory System*

$$\text{Beginning Inventory} + \text{Purchases (net)} - \text{Ending Inventory} = \text{Goods Sold}$$

Note that you can think of each equation in terms of *units* or *costs*.

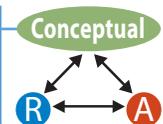

## ITEMS TO BE INCLUDED IN INVENTORY QUANTITIES

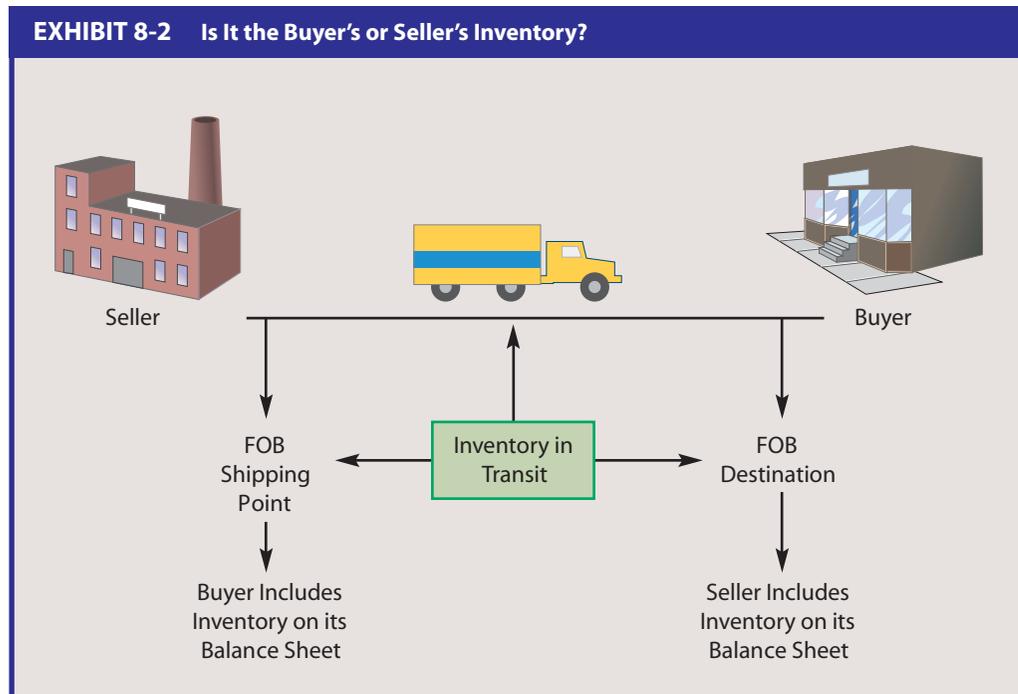

The basic criterion for including items in inventory is *economic control* rather than physical possession or legal ownership. In simple situations, all three occur at the same time. However, because there may be differences in more complex situations, the *economic substance* of the transaction should always take precedence over its *legal form* to determine whether the buyer or the seller has economic control. While control is often easy to determine, it may be affected by the following issues.

Goods are often shipped under one of two alternatives: **FOB (free-on-board) shipping point** or **FOB destination**. When goods are in transit at the end of the accounting period, the terms of shipment determine whether the seller or the buyer includes them in its inventory. **If the goods are shipped FOB shipping point, control of (and legal title to) the goods is transferred at the shipping point when the seller delivers them to the buyer, or to a transportation company that is acting as an agent for the buyer. The buyer has economic control and includes those goods in its inventory, and the seller excludes them. If goods are shipped FOB destination, control of (and legal title to) the goods is not transferred until the goods are delivered to the buyer's destination. The seller has economic control and includes those goods in its inventory, and the buyer excludes them.** We show these situations in Exhibit 8-2.

Economic control may also transfer before or after physical possession (and legal ownership) transfer. For example, suppose the buyer requests that the seller holds the goods to be delivered later, and the goods are segregated from the seller's other inventory so that the risk of ownership has passed to the buyer. In this case, control has passed and the seller should exclude the goods from inventory and the buyer should include them. This is known as a "bill and hold" sale. Also, goods may be transferred on **consignment**. As we discuss in Chapter 18, the company delivering the goods, the **consignor**, retains economic control (and ownership), while the company receiving the goods, the **consignee**, attempts to sell them. The consignor includes the goods in its inventory until they are sold by the consignee. Transfer of control may also be affected by product financing arrangements (discussed in Chapter 9), and by sales made when there is a right of return (discussed in Chapter 6).

3 Identify how inventory quantities are determined.

Physical transfer of goods usually determines when the seller records the sale and the buyer records the inventory, respectively, in their accounting systems. However, both companies should adjust the recorded amounts in situations where physical possession is not consistent with economic control on the balance sheet date. However, companies may ignore these adjustments if the effects are not material.

As we discuss in Chapter 18, what a company includes in inventory depends on its revenue recognition decisions. A company first decides when it is appropriate to recognize revenue and then matches the cost of goods sold against that revenue. As it recognizes the cost of goods sold, it reduces its inventory.

## DETERMINATION OF INVENTORY COSTS

### 4 Determine the cost of inventory.

There are two issues in determining inventory costs. We discuss the costs attached to each unit *available for sale* in this section. We discuss the costs attached to the *ending inventory* and *cost of goods sold* (the inventory cost flow assumption) later in this chapter.

The cost of inventory is the price paid or consideration given to acquire it.<sup>1</sup> Thus, **inventory cost includes costs directly or indirectly incurred in bringing an item to its existing condition and location.** For each item of inventory, purchased or manufactured, a company must make a decision as to whether or not each cost meets this definition. If it does, the company includes it in the cost of the inventory. If it does not, the company immediately recognizes it as an expense. The cost of purchased inventory should include the purchase price (net of purchases discounts, as we discuss later) plus payments directly related to the inventory, such as freight-in, receiving, unpacking, inspecting, storage, insurance, personal property taxes, sales and other applicable taxes, and similar costs. When a company purchases more than one type of inventory for a

1. "Restatement and Revision of Accounting Research Bulletins," *Accounting Research and Terminology Bulletins, Final Edition, No. 43* (New York: AICPA, 1961), ch. 4, par. 4; and "Inventory Costs—An Amendment of ARB No. 43, Chapter 4," *FASB Statement of Financial Accounting Standards No. 151* (Norwalk, Conn.: FASB, 2004).

single sum and it cannot identify the costs of each type, it should use the relative fair value method to apportion the cost, as we discuss in Chapter 10.

Some costs that should be attached to inventor normally are excluded because of the cost/benefit relationship. For example, the costs of operating a purchasing department are necessary to bring the item to its existing condition and location, but the practical difficulties involved in allocating these costs to the separate inventories often exceed the benefits that result from not

making an allocation. Also, **FASB Statement No. 151** requires that abnormal amounts of idle facility costs, freight and handling costs, and spoilage are expensed in the period and are *not* included in the cost of inventory.

Another cost that *may* be included in the cost of inventory is the interest cost for amounts a company borrowed to finance the purchase of the inventory. It can be argued that this interest cost is incurred indirectly in order to bring an item to its existing condition and location and, therefore, should be added to the inventory cost. Alternatively, it can be argued that borrowing costs are period costs associated with the general activities of the company, and none is related specifically to the acquisition of a particular inventory item. According to *FASB Statement No. 34*, interest costs are *not* included in the cost of inventory that is *routinely manufactured* (discussed in Chapter 10). However, interest cost is included in the cost of inventory that is manufactured over an extended period of time (as we discuss in Chapter 18).

When a company manufactures inventory, it adds the **product costs** that are directly and indirectly incurred in the production activity to the cost of inventory. The costs that it includes are acquisition and production costs (including manufacturing overhead). The company expenses **period costs**, such as general and administrative costs, except for the portion of such costs that are clearly related to production and thus are included in inventory costs. Selling costs are not associated with bringing the item to its existing condition and location. Instead, they are an expense of the period and not an inventory cost because they apply to the units sold during the period and not to the units held in inventory.

## Purchases Discounts

Many sellers offer discounts to buyers to encourage prompt payment. These discounts, called purchases discounts, may be accounted for by the gross price method or the net price method. These methods raise questions about whether purchases discounts should directly affect a company's income or its inventory cost. They also can be used to show how efficient management is.

**Under the gross price method, a company records the purchase at the gross price and records the amount of the discount in the accounting system only if the discount is taken.** This discount should be deducted from the purchase price of the inventory. **Under the net price method, a company records the purchase at its net price and records the amount of the discount in the accounting system only if the discount is**

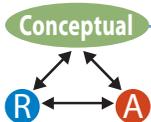

Credit: JASON M. CARRIER/Bloomberg News/Landov

*not taken.* This discount lost should be treated as a period expense.<sup>2</sup> We illustrate these two alternatives in Example 8-1 for a company that purchases \$1,000 of goods under terms of 1/10, n/30 (a 1% discount is allowed if payment is made within 10 days; otherwise, full payment is due within 30 days).

### EXAMPLE 8-1 Alternative Methods of Accounting for Purchases Discounts

	Gross Price Method		Net Price Method	
To record the purchase	Inventory (or Purchases)	1,000	Inventory (or Purchases)	990
	Accounts Payable	1,000	Accounts Payable	990
To record payment within the discount period	Accounts Payable	1,000	Accounts Payable	990
	Purchases Discounts Taken	10	Cash	990
	Cash	990		
To record payment outside the discount period	Accounts Payable	1,000	Accounts Payable	990
	Cash	1,000	Purchases Discounts Lost	10
			Cash	1,000
Adjusting entry at end of period if discount has expired and invoice is unpaid	No entry required		Purchases Discounts Lost	10
			Accounts Payable	10

#### Conceptual Evaluation of the Two Methods

The correct inventory cost is the invoice price less all available discounts. Therefore, a company should treat the purchases discounts lost under the net price method as a financing expense for the period and should not include it in inventory cost, because **losing the discount does not increase the economic benefit to be derived from the inventory.** To be consistent, a company should treat the purchases discounts taken under the gross price method as a reduction in inventory cost. However, if some discounts were not taken, the inventory cost would include those discounts lost, even though they do not increase the economic benefits of the inventory. **Therefore, the correct inventory cost is always recorded under the net price method, but under the gross price method only if all discounts are taken** (or if the company makes an adjustment to remove the discounts lost from the cost of the inventory and records the cost as a financing expense).

Sometimes it is argued that the discounts taken under the gross method should be treated as an increase in income. This is not correct because the matching principle would be violated, since the discounts may relate to goods that have not yet been sold. Furthermore, a company does not earn income by buying goods and paying bills. **The revenue recognition principle requires that a sale of goods (or services) occur before a company recognizes income.** However, for practical reasons, a company may include purchases discounts in income; this is acceptable provided that the amount is not material. Retailing companies often follow this procedure.

Another advantage of the net price method is that it isolates the purchases discounts lost, thereby highlighting inefficiencies, which assists the management control process. For example, if a company purchases goods on terms of 2/10, n/30 and does not take the discount, it is paying 2% to delay payment by 20 days (the 30-day maximum less the 10 days allowed to take the discount), which is an approximate annual rate of 36% ( $2\% \times 360/20$ ).

2. In a third method, the allowance method, the purchase is recorded at the net price, the accounts payable at the gross price, and the difference is debited to an allowance account. The allowance account is reduced by the difference between the cash paid to the supplier and the accounts payable balance. It is also adjusted for purchases discounts not taken.

The net price method can be criticized, though, because Accounts Payable does not represent the maximum amount of the liability that the company may be required to pay, although it does reflect the most likely amount if the company generally takes the discounts. However, the adjusting entry illustrated in Example 8-1 for expired discounts will ensure that the correct liability (the gross price) appears on the company's balance sheet. Despite the advantages of the net price method, the gross price method is more common because it is simpler to use and the results produced usually are not materially different from the net price method.

Purchases discounts are different from trade discounts. As we discussed in Chapter 7, **trade discounts are discounts deducted prior to arriving at the invoice price and do not enter into the accounting system.**

### SECURE YOUR KNOWLEDGE 8-1

- Common inventory classifications used by companies range from a single (merchandise) inventory account for merchandisers to raw materials inventory, work in process inventory, and finished goods inventory for manufacturers.
- Two alternative inventory systems may be used to account for inventory:
  - A perpetual inventory system, which makes inventory management and control easier, and keeps a continuous record of inventory quantities and cost of goods sold.
  - A periodic inventory system relies on physical counts of inventory to determine inventory quantities and cost of goods sold.
- Economic control is the key factor that a company should consider in determining whether an item is a part of inventory (substance over form).
- Inventory costs should include all costs (e.g., purchase price, freight-in, insurance, taxes) that are directly or indirectly incurred to obtain the inventory.

## COST FLOW ASSUMPTIONS

A company typically starts an accounting period with some units in the beginning inventory and then purchases or produces additional units during the period. Together these are the *goods available for sale*, which the company then either sells or retains in its ending inventory.

For financial statement purposes, a company must attach *costs* to these units. The cost of the beginning inventory (the cost of the ending inventory of the preceding period) is the beginning balance in the Inventory account. The beginning balance in Inventory plus the cost of purchases or production (discussed earlier) is the *cost of the goods available for sale*. This total cost is allocated between the cost of goods sold and ending inventory using a *cost flow assumption*. The major cost flow assumptions are specific identification; first-in, first-out (FIFO); average cost; and last-in, first-out (LIFO). We show both the unit relationship and the cost flow relationship in Exhibit 8-3.

Cost flow assumptions are important for two reasons. First, a company has inventories at each year-end. If there were none, all the cost of goods available for sale would be transferred to cost of goods sold. Second, the costs of purchases and production change during the year. If these costs did not change, all units would have the same cost. Therefore, alternative cost flow assumptions would not affect the cost of goods sold or the ending inventory. Note that we are discussing *cost* flow assumptions here. There is no requirement that they be related to the *physical* flow (except for the specific identification method).

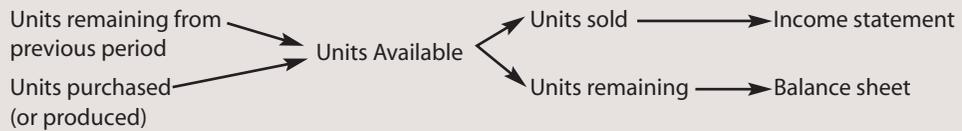

We discuss each cost flow assumption in the following sections and apply it to both the perpetual and the periodic inventory systems using the information for the Dalton

**5** Compute ending inventory and cost of goods sold under specific identification, FIFO, average cost, and LIFO.

**EXHIBIT 8-3 Illustration of Unit and Cost Flow Relationships**

**UNITS**

**COSTS**

Company shown in Example 8-2. Recall that under the periodic system, the ending inventory is computed before the cost of goods sold, whereas under the perpetual system, the cost of goods sold is calculated first. To make the example less complicated, we use a merchandising company, although a manufacturing company uses the same principles.

**EXAMPLE 8-2 Inventory Inflows and Outflows for Dalton Company**

Inventory, April 1	100	units @ \$10 per unit	\$1,000
Purchases, April 10	80	units @ \$11 per unit	880
Purchases, April 20	<u>70</u>	units @ \$12 per unit	<u>840</u>
Goods Available for Sale	250	units	<u>\$2,720</u>
Sales, April 18	(90)	units	} 140 units
Sales, April 27	<u>(50)</u>	units	
Inventory, April 30	<u>110</u>	units	

Notes: (1) The beginning inventory is valued at \$10 per unit for all the flow assumptions. However, if costs are changing, this value would be different for different flow assumptions because the beginning inventory for the current period is the ending inventory of the preceding period.  
 (2) The company uses a monthly accounting period.

**Specific Identification**

Under the specific identification inventory cost flow assumption, a company identifies each unit sold and each unit remaining in the ending inventory and includes the actual costs of those units in cost of goods sold and ending inventory, respectively. For example, the company must specifically identify each unit sold on April 27. If all the units are from beginning inventory, the company's cost of goods sold is \$10 for each unit. However, if they are from the units purchased on April 10 or April 20, its cost of goods sold would be either \$11 or \$12 for each unit, respectively. Similarly, the company must identify each unit in the ending inventory and attach the appropriate cost of \$10, \$11, or \$12 to it.

The specific identification method can be applied in either a perpetual or a periodic inventory system. However, it is more reasonable to use it with a perpetual system in which each unit is identified as it is sold and the appropriate cost attached. While the specific identification method seems simple and matches costs as expenses against revenues, there are significant objections to its use. It may be practical in a few situations in

which units are costly and can be easily distinguished (for example, a car dealership). But, in many complex manufacturing and retailing situations it is not practical to apply the specific identification method because the cost of each individual unit is not identifiable (e.g., a single can of soup), and it is not known which specific units are sold. In addition, as volume increases, so does the cost of record keeping, and the method may become too expensive to use.

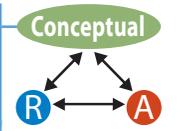

Another argument against the method is that the amount of profit varies even though the units of inventory are identical. Continuing the preceding example, if the units were sold on April 27 for \$30, then using a \$10 unit or a \$12 unit for sale would make the gross profit either \$20 per unit or \$18 per unit, respectively. In summary, the specific identification method can produce ending inventory and cost of goods sold amounts at the two extremes of FIFO and LIFO, or at values in between. This ability of a company's management to select, or "manipulate," its profits is not desirable. However, the method is appropriate if each item is unique. We do not show any summary amounts in this section because they are so dependent on the assumptions regarding the particular units selected for sale.

### First-In, First-Out (FIFO)

Under the FIFO cost flow assumption, a company includes the earliest costs incurred in the cost of goods sold, and includes the most recent costs in the ending inventory. We show these relationships as follows:

In other words, the first costs incurred are the first transferred to cost of goods sold. Consequently, the ending inventory consists of the most recent costs incurred. Therefore, in periods of rising costs, FIFO produces a lower cost of goods sold amount based on older and lower costs. However, the ending inventory is based on the most recent and higher costs, as we discuss in the evaluation section later in this chapter.

If the Dalton Company uses the periodic method, it computes the ending inventory of \$1,280 first, as we show in Example 8-3. The ending inventory of 110 units is based on the most recent costs incurred. It includes 40 units purchased on April 10 for \$11 each and 70 units purchased on April 20 for \$12 each. The company calculates the cost of goods sold of \$1,440 by subtracting the ending inventory from the cost of goods available for sale as we show in Example 8-3. Therefore, it is based on the earliest costs incurred and includes the beginning inventory of 100 units at \$10 each and 40 units from the April 10 purchase at \$11 each.

EXAMPLE 8-3		FIFO Cost Flow Assumption (Periodic Inventory System)				
<i>Ending Inventory (110 units):</i>						
40 units @ \$11			\$ 440			
70 units @ \$12			840			
			<u>\$1,280</u>			
<i>Cost of Goods Sold (140 units):</i>						
Beginning Inventory	+	Purchases	-	Ending Inventory	=	Cost of Goods Sold
\$1,000		+ \$1,720		- \$1,280		= <u>\$1,440</u>

If the Dalton Company uses the perpetual inventory system (for costs as well as physical quantities), it calculates the cost of goods sold of \$1,440 and the ending inventory of \$1,280 as we show in Example 8-4. The \$1,440 cost of goods sold for 140 units is based on the earliest costs incurred. For the April 18 sale, the 90 units have a cost of \$10 per unit (from the beginning inventory). For the April 27 sale, the 90 units have a cost of \$10 per unit (from the beginning inventory) and 40 units have a cost of \$11 per unit (from the April 10 purchase). The company determines the \$1,280 ending inventory by deducting the \$1,440 cost of goods sold from the \$2,720 cost of goods available for sale. The ending inventory is 110 units and includes the most recent costs: the cost of the remaining 40 units from the first purchase on April 10 and the 70 units purchased on April 20.

<b>EXAMPLE 8-4</b>		<b>FIFO Cost Flow Assumption (Perpetual Inventory System)</b>				
<i>Cost of Goods Sold (140 units):</i>						
April 18	90 units @ \$10		\$ 900			
April 27	50 units: 10 units @ \$10		100			
	40 units @ \$11		440			
	<b>Total</b>		<u>\$1,440</u>			
<i>Ending Inventory (110 units):</i>						
Beginning Inventory	+	Purchases	-	Cost of Goods Sold	=	Ending Inventory
\$1,000		+ \$1,720		- \$1,440		<u>\$1,280*</u>
*40 units @ \$11 =		\$ 440				
70 units @ \$12 =		840				
		<u>\$1,280</u>				

Note that the ending inventory and the cost of goods sold under both the perpetual and the periodic systems are identical; this always is true for the FIFO cost flow assumption because the most recent costs incurred always are included in the ending inventory.

### Average Cost

**Under the average cost flow assumption, a company considers all the costs and units to be combined so that no individual units or costs are identified.** When a company uses the periodic inventory system, the average cost method is known as the **weighted average method**. The company calculates the cost of the units for the period based on the cost of the beginning inventory and the average cost of the units purchased or manufactured, weighted according to the number of units at each cost. In other words, **under the weighted average method, the average cost per unit for the period is the cost of goods available for sale divided by the number of units available for sale.** The company uses this average cost for both its ending inventory and the cost of goods sold.

The weighted average unit cost for the Dalton Company in April is \$10.88 (the cost of goods available for sale of \$2,720 ÷ the number of units available for sale of 250), as we show in Example 8-5. It records the ending inventory at this \$10.88 cost per unit, resulting in a total cost of \$1,197. The company computes the \$1,523 cost of goods sold by deducting the ending inventory from the cost of goods available for sale of \$2,720. It is also equal to the 140 units sold multiplied by the \$10.88 weighted average cost.

When a company uses the average cost method under a perpetual inventory system (for costs as well as physical quantities), the same principles are applied. But it is known as

**EXAMPLE 8-5** Weighted Average Cost Flow Assumption  
(Periodic Inventory System)

Cost of goods available for sale (\$1,000 + \$1,720)		\$2,720
Units available for sale		250
Average cost (Cost ÷ Number of units)		\$10.88
Ending inventory (110 units @ \$10.88)		<u>\$1,197</u>
Beginning Inventory + Purchases – Ending Inventory = Cost of Goods Sold		
\$1,000	+ \$1,720	– \$1,197 = <u>\$1,523</u>

a **moving average** method because a new weighted average cost must be calculated after *each* purchase, as we show in Example 8-6. The new weighted average is computed in the same way as in the weighted average method. That is, **under the moving average method, the average cost per unit is the cost of the units available for sale after the purchase divided by the number of units available for sale at that time.** This average cost is used to determine the cost of each sale made until the next purchase, when a new average cost is calculated. The average cost after the April 10 purchase is \$10.44 (cost of goods available for sale of \$1,880 ÷ the number of units available for sale of 180). Therefore, the sales on April 18 have a cost of \$10.44 per unit for a total cost of goods sold of \$940. The purchase on April 20 increases the average cost to \$11.125 per unit, and therefore the 50 units sold on April 27 have a total cost of \$556. The total cost of goods sold for April is \$1,496 (\$940 + \$556). The company records the ending inventory at the final average cost for the period, which it calculates after the last purchase. The cost of \$11.125 per unit for the 110 units results in a total ending inventory of \$1,224 (see Example 8-6).

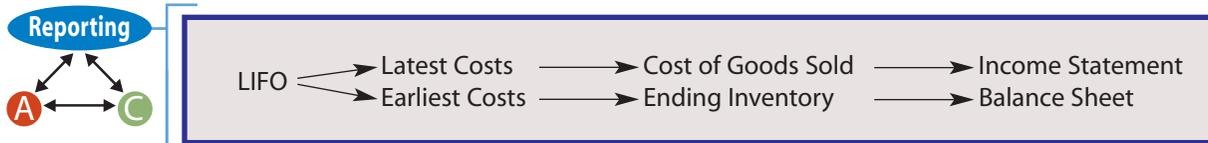

**EXAMPLE 8-6** Moving Average Cost Flow Assumption  
(Perpetual Inventory System)

April 1, Beginning Inventory	100 units @ \$10	\$ 1,000
April 10, Purchases	<u>80 units @ \$11</u>	<u>880</u>
April 10, Balance	180 units @ \$10.44	\$ 1,880
April 18, Sales	<u>(90) units @ \$10.44</u>	<u>(940)</u>
April 18, Balance	90 units @ \$10.44	\$ 940
April 20, Purchases	<u>70 units @ \$12</u>	<u>840</u>
April 20, Balance	160 units @ \$11.125	\$ 1,780
April 27, Sales	<u>(50) units @ \$11.125</u>	<u>(556)</u>
April 30, Balance	110 units @ \$11.125	<u>\$ 1,224</u>
Cost of Goods Sold (140 units)	\$940 + \$556	<u>\$ 1,496</u>
Ending Inventory (110 units @ \$11.125)		<u>\$ 1,224</u>

### Last-In, First-Out (LIFO)

Under the LIFO cost flow assumption, a company includes the most recent costs incurred in the cost of goods sold, and includes the earliest costs (part or all of which

are costs incurred in previous periods) in the ending inventory. We show these relationships as follows:

Therefore, in periods of rising costs, LIFO produces a higher cost of goods sold figure based on the most recent costs. However, the ending inventory is based on the oldest and lowest costs. We discuss the logic behind this procedure later in this chapter.

If the Dalton Company uses the periodic inventory system, it gives no consideration to the timing of the individual sales. It calculates the ending inventory of \$1,110 and the cost of goods sold of \$1,610 as we show in Example 8-7. The ending inventory includes the earliest costs, which are the cost of the beginning inventory and the cost of the 10 units from the first purchase on April 10. The company computes the cost of goods sold by subtracting the ending inventory from the cost of goods available for sale. This implicitly includes the cost of the 70 units purchased on April 20 (\$840) and the cost of 70 units purchased on April 10 (\$770).

**EXAMPLE 8-7 LIFO Cost Flow Assumption (Periodic Inventory System)**

<i>Ending Inventory (110 units):</i>			
100 units @	\$10		\$1,000
10 units @	\$11		110
			\$1,110
 <i>Cost of Goods Sold (140 units):</i>			
Beginning Inventory + Purchases – Ending Inventory = Cost of Goods Sold			
\$1,000	+	\$1,720	–
		\$1,110	=
			\$1,610

If the Dalton Company uses the perpetual inventory system (for costs as well as physical quantities), it calculates the cost of goods sold for each sale at the cost(s) of the most recent purchase(s). The \$1,580 cost of goods sold for 140 units includes the sale of 90 units on April 18, and 50 units on April 27, as we show in Example 8-8. For the April 18 sale, 80 of the 90 units have a cost of \$11 each from the April 10 purchase and 10 units have a cost of \$10 each from the beginning inventory. The 50 units on April 27 have a cost of \$12 from the April 20 purchase. The company computes the \$1,140 ending inventory by deducting the \$1,580 cost of goods sold from the \$2,720 cost of goods available for sale. It consists of 110 units and includes the earliest costs: the cost of the 90 units left from the beginning inventory and the remaining 20 units from the April 20 purchase.

Note that the cost of goods sold and the ending inventory are *not* the same for the LIFO perpetual method and the LIFO periodic method because of different assumptions about the timing of the sales. Under the periodic method, the whole accounting period (a month in this example) is treated as a single time period, and all the sales are assumed to take place after all the units have been purchased during the period. Therefore, the cost of goods sold includes the costs of the *most recent purchases of the period*. Under the perpetual method, each event is recorded as it occurs. Therefore, the cost of goods sold is calculated when each sale is made and includes the costs of the *most recent purchase(s) at that time*.

**EXAMPLE 8-8 LIFO Cost Flow Assumption  
(Perpetual Inventory System)**

<i>Cost of Goods Sold (140 units):</i>			
April 18	90 units: 80 units @ \$11		\$ 880
	10 units @ \$10		100
April 27	50 units @ \$12		600
			\$1,580
 <i>Ending Inventory (110 units):</i>			
Beginning Inventory	+	Purchases	−
\$1,000		\$1,720	−
		\$1,580	=
			\$1,140*
 *90 units @ \$10 = \$ 900			
20 units @ \$12 = 240			
\$1,140			

In the Dalton Company example, unit sales are less than unit purchases for the period. Therefore, under the *periodic* inventory system, the company does *not* include costs from the beginning inventory in cost of goods sold. However, the first sale in the month is larger than the first purchase. Therefore, under the *perpetual* inventory system, the company includes the costs of 10 units of its beginning inventory in cost of goods sold. Furthermore, under the perpetual system, the second sale of 50 units has a cost of \$12 per unit from the second purchase, leaving 20 units of that purchase in inventory. However, under the periodic system, the company includes the entire purchase of units at \$12 each in its cost of goods sold, leaving none in inventory. These factors explain the difference of \$30 in the cost of goods sold and the ending inventory between the two methods.

In each case the LIFO ending inventory of the Dalton Company consists of two layers. Each period in which the number of units in inventory *increases*, the company adds a layer of costs to its LIFO inventory. When the number of units in inventory *decreases*, the company removes costs from its beginning inventory of the period in the reverse order in which it added them—that is, it removes the most recent layers first and includes them in cost of goods sold.

### Comparison of Inventory Cost Flow Assumptions

We summarize the cost of goods sold and the inventory amounts for the Dalton Company calculated in the preceding examples in Example 8-9. However, we exclude the specific identification method because, as we discussed previously, the results are dependent on the assumptions regarding the particular units selected for sale.

**EXAMPLE 8-9 Effects of Inventory Cost Flow Assumptions**

Cost Flow Assumption and Method	Cost of Goods Available for Sale	Cost of Goods Sold	Ending Inventory
FIFO, periodic	\$2,720	\$1,440	\$1,280
FIFO, perpetual	2,720	1,440	1,280
Weighted average, periodic	2,720	1,523	1,197
Moving average, perpetual	2,720	1,496	1,224
LIFO, periodic	2,720	1,610	1,110
LIFO, perpetual	2,720	1,580	1,140

In this example, costs rose throughout the period. As a result, the FIFO method produces the lowest cost of goods sold because it includes the oldest and lowest costs. Since the cost of goods sold is lowest, the gross profit (and income) is highest. Correspondingly, the ending inventory using FIFO has the highest cost because it includes the most recent and highest costs. In contrast, the LIFO method produces the highest cost of goods sold and the lowest gross profit (and income) because it includes the most recent and highest costs. The LIFO ending inventory is lowest because it includes the earliest and lowest costs. The average cost amounts are between the FIFO and LIFO extremes because the ending inventory and the cost of goods sold include an average of both the lower and higher costs of the period. Note that this example is simplified because we assumed that the beginning inventory was \$10 per unit for FIFO, average, and LIFO. When an inventory cost flow assumption is used in consecutive periods, the beginning inventory in each period is different under the alternative cost flow assumptions.

The Dalton Company was experiencing rising costs, but if costs were falling consistently, the opposite relationships would occur. The use of LIFO would produce a higher ending inventory, a lower cost of goods sold, and a higher gross profit (and income) than FIFO. When costs fluctuate, no general relationships can be described. The differences between the amounts under the periodic and the perpetual inventory systems for each cost flow assumption result from the different calculations and not from any differences in the logic underlying the cost flow assumptions.

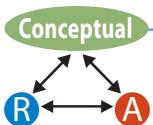

## CONCEPTUAL EVALUATION OF INVENTORY COST FLOW ASSUMPTIONS

- 6 Explain the conceptual issues regarding alternative inventory cost flow assumptions.

Many arguments are made in favor of each of the alternative cost flow assumptions. These arguments focus on a comparison of LIFO and FIFO, although the average cost method may be considered as similar to FIFO for this discussion. Sometimes, the FIFO and average cost methods are referred to as nonLIFO methods. Initially, our discussion assumes that inventory costs are rising. The advantages of LIFO are that it provides a better measure of income in times of rising costs, and it results in the payment of less income taxes. The disadvantages of LIFO are the impact of the liquidation of LIFO layers, the possibility of income manipulation, the inventory valuation on the balance sheet, and the lack of comparability among companies using LIFO. There also are several issues involved in selecting a method. We discuss and evaluate each of these issues in the following sections. In addition, we discuss specific arguments that relate solely to the average cost method. We discussed the arguments for and against the specific identification method earlier in the chapter.

### Income Measurement

For financial reporting, the basic criterion a company uses to select a cost flow assumption is to achieve a "proper determination of income through the process of matching appropriate costs and revenues."<sup>3</sup> **There is no requirement that the assumed flow of costs be related to the actual physical flow of goods.** Most companies use a FIFO method for the physical management of inventory to reduce the likelihood of obsolescence. Such companies may use any of the alternative cost flow assumptions in their financial statements.

But what are "appropriate" costs? Unfortunately, there is no simple answer as to whether income is better measured under LIFO or FIFO. Both methods match historical costs with revenues, but **the major argument in favor of LIFO is that it matches the most recent costs with revenue.** The most recent costs are closer to replacement costs. Therefore, LIFO excludes from a company's income some (but not all) of the holding gains, so that the income reflects the earnings after capital has been maintained and is a

3. *Accounting Research and Terminology Bulletins, Final Edition, op. cit.*

better measure of the increase in wealth of the company. A **holding gain (or inventory profit)** is the difference between the historical cost and the replacement cost of units sold. In contrast, FIFO matches the earliest costs with revenue and *includes* all the holding gains in income.

In the Dalton Company example, when the company sells a unit on April 27 for \$30, if the unit cost of the goods sold is \$10 (FIFO) and the most recent acquisition cost was \$12 per unit, the gross profit of \$20 per unit (the selling price of \$30 minus the cost of \$10) includes a holding gain of \$2 per unit (the most recent cost to replace the inventory of \$12 less the cost of \$10). The LIFO method records in cost of goods sold the cost of \$12 per unit, resulting in a gross profit of \$18 per unit, thereby *excluding* the holding gain of \$2 from income. We show these two alternatives in Example 8-10. To continue this example, suppose that the company started with \$10 cash, which it used to purchase a unit of inventory. When the company sells that unit for \$30, it recognizes \$20 of income under FIFO. If the company distributes the \$20 income as a dividend, it is left with \$10 cash, which is not enough to purchase a unit of inventory at its higher price of \$12. Thus the income of \$20 includes a holding gain of \$2, which is not real income since the company cannot distribute it to the owners without leaving it worse off in terms of its ability to maintain the same level of inventory.

**EXAMPLE 8-10** Alternative Cost Flow Assumptions and Holding Gains (per Unit)

	FIFO	LIFO (\$12)	LIFO (\$11)
Revenue	\$30	\$30	\$30
Cost of goods sold	(10)	(12)	(11)
Gross profit	<u>\$20</u>	\$18	\$19
Holding gains (excluded from income)		<u>2</u>	<u>1</u>
		<u>\$20</u>	<u>\$20</u>

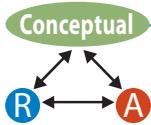

In this example, the LIFO method excluded all the holding gains. However, in other situations, it may not exclude them all. Under LIFO the Dalton Company included units at \$11 per unit in the cost of goods sold (for the periodic method), whereas the most recent purchase price was \$12 per unit. Therefore, the income included holding gains of \$1 on each of these units. We also show this alternative in Example 8-10.

Also note that if the replacement cost of the inventory was \$13 at the end of the month, the Dalton Company has not achieved the matching of current costs with revenue, even on the \$12 units, and would include even more holding gains in income. In summary, it can be seen that “matching appropriate costs and revenues” is interpreted very widely. FIFO, LIFO, average cost, and specific identification all match historical cost with revenue, and are generally accepted accounting principles.

## Income Tax Effects

As we have seen, LIFO produces the highest cost of goods sold and the lowest income under conditions of rising costs. Although it might be thought that a company would consider it undesirable to report low *accounting* income, it must be remembered that lower *taxable* income results in payment of lower income taxes. For example, three long-time LIFO users—**Exxon**, **General Motors**, and **General Electric**—have together saved more than \$2 billion in taxes compared to what they would have paid using FIFO.

The use of LIFO for the computation of federal income taxes presents a special situation. The Internal Revenue Code permits a company to use LIFO for income tax purposes

only if it also uses LIFO in its financial statements. This requirement is known as the **LIFO conformity rule**. A company might prefer to report a higher income for accounting purposes when costs are rising by using FIFO even though, as discussed before, its income is overstated because it includes holding gains. The LIFO conformity rule prevents a company from having “the best of both worlds” by using FIFO for financial reporting and LIFO for income taxes. This is in contrast to many situations in which a company can use different methods (e.g., when it uses straight-line depreciation for financial reporting and accelerated depreciation for income tax reporting). A company must decide whether it is willing to report a lower accounting income in order to achieve the advantages of the real economic benefits of reduced cash payments for income taxes.

Because of rulings by the Internal Revenue Service that allow a company using LIFO more latitude in the supplementary reporting of cost of goods sold and income on a FIFO basis, the Securities and Exchange Commission issued a ruling indicating how such disclosures should be made.<sup>4</sup> Also, since there was a lack of authoritative literature on the specifics of applying LIFO in complex situations, the tendency was to follow the income tax rules, which were much more specific. Since this did not always lead to appropriate financial reporting, the AICPA published an *Issues Paper* that was endorsed by the SEC, thereby giving it authoritative status.<sup>5</sup> The specific topics included in these two publications are beyond the scope of this book.

The Tax Reform Act of 1986 established “uniform capitalization rules” that require a company to include in inventory certain costs that previously it expensed as incurred for tax purposes. These costs include such items as purchasing, warehousing, and distribution costs, including related officer salaries and administrative costs. Because a cost must be capitalized for income tax purposes does not mean that capitalizing it for financial reporting is preferable, or even appropriate. Each situation must be analyzed based on the particular circumstances. The likely result in many situations is that inventory cost is different between financial reporting and income tax reporting.

### Liquidation of LIFO Layers

A company using the LIFO method may liquidate inventory during a period. This occurs when the number of units in ending inventory is less than the number in beginning inventory because unit sales are more than the units acquired during the period. Therefore, some of the beginning inventory costs are included in cost of goods sold. In other words, the layers of LIFO inventory costs added in previous periods are removed in reverse order; the last costs added are the first expensed. Assuming rising costs, these units have lower costs attached to them; thus cost of goods sold is lower and gross profit (and income) is higher than if the liquidation did not occur. This increased amount of income is often referred to as a **LIFO liquidation profit**.

Many companies adopted LIFO in 1939 when the method was first allowed to be used by all companies for income tax purposes, and also in the higher inflation period between 1975 and 1985. Therefore, a company’s LIFO liquidation profit may be significant because it includes some very old costs in cost of goods sold. An extreme example of LIFO liquidation profits occurs when a company liquidates its inventory down to the base (the beginning inventory in the year it adopted LIFO). In summary, liquidations bring units with a cost from previous years into cost of goods sold and produce an unrealistically high income.

4. “Codification of Financial Reporting Policies,” *SEC Accounting Rules* (Chicago: Commerce Clearing House, August 2005), sec. 205.

5. “Identification and Discussion of Certain Financial Accounting and Reporting Issues Concerning LIFO Inventories,” *Issues Paper* (New York: AICPA, 1984), and “LIFO Inventory Accounting Practices for Financial Statement Purposes,” *Staff Accounting Bulletin 58* (Washington, D.C.: SEC, 1985).

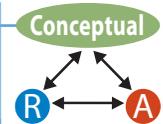

**Example: LIFO Liquidation Profit** To illustrate the concept of a LIFO liquidation profit, assume that a company was formed in 2003. Its 2007 beginning inventory of \$644,000 is made up of four layers as follows:

2003:	10,000 units at \$20 per unit =	\$200,000
2004:	6,000 units at \$22 per unit =	132,000
2005:	8,000 units at \$24 per unit =	192,000
2006:	4,000 units at \$30 per unit =	<u>120,000</u>
Inventory, January 1, 2007		<u>\$644,000</u>

In 2007 the company purchases (or manufactures) 50,000 units at \$35 per unit but sells 60,000 units. The company has an inventory liquidation of 10,000 units. It includes these 10,000 units in cost of goods sold at the most recent beginning inventory costs; that is, the most recently added layers. Therefore, the company's cost of goods sold for 2007 includes costs from 2007, 2006, and 2005, as follows:

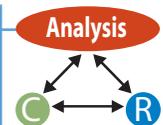

50,000 units at \$35 per unit =	\$1,750,000	(2007 costs)
4,000 units at \$30 per unit =	120,000	(2006 costs)
<u>6,000 units at \$24 per unit =</u>	<u>144,000</u>	(2005 costs)
	<u>\$2,014,000</u>	

If, instead, the company had purchased (or produced) 60,000 units at \$35 each (thus avoiding the LIFO liquidation), the company would have had a cost of goods sold in 2007 of \$2,100,000 (60,000 units × \$35 per unit) consisting entirely of 2007 costs. The difference of \$86,000 (\$2,100,000 – \$2,014,000) is the LIFO liquidation profit (before income taxes). If we assume an income tax rate of 30%, the effect of the LIFO liquidation is to increase gross profit by \$86,000, income tax expense by \$25,800 (\$86,000 × 30%), and net income by \$60,200 (\$86,000 × 70%). Note that the company's income is higher (because cost of goods sold includes older and lower costs) even though there is **no economic substance to the higher income, and the company pays the additional income taxes** (because of the higher taxable income reported under the LIFO conformity rule). A company that reports to the SEC is required to disclose the amount of its LIFO liquidation profit so that users of the financial statements may obtain a better understanding of the profit earned by the company. For example, **Eastman Kodak Company** reported LIFO liquidation profits of \$69 million and \$45 million in 2004 and 2003, respectively. ♦

### Earnings (Income) Management

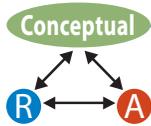

As we have seen, a company's liquidation of inventory under LIFO, whether intentional or not, results in higher income (assuming rising costs). Such a liquidation may be caused by economic factors beyond the control of the company, such as a strike or a scarcity of raw materials, or as a result of a management decision such as the adoption of a "just-in-time" inventory system, which results in a permanent reduction in the size of the inventory. Also a liquidation may be deliberately created by delaying purchases. Intentional liquidation to artificially increase income is a significant concern. If a company is facing a period of lower income, management can increase income intentionally by liquidating inventory. This can be achieved by delaying purchases until after the end of the fiscal year.

Also, a company may influence (manage) its income by increasing its purchases. To illustrate, refer back to the Dalton Company periodic LIFO example and assume that the company purchased an additional 40 units on April 29 at \$12 per unit. Total purchases then would be \$2,200 (\$1,720 + \$480). The ending inventory would then consist of 150 units (110 + 40) and have a cost of \$1,550 (100 units at \$10 each from the beginning

inventory + 50 units at \$11 each from the April 10 purchase). The cost of goods sold would be computed as follows:

$$\begin{array}{r r r r r r r} \text{Beginning Inventory} & + & \text{Purchases} & - & \text{Ending Inventory} & = & \text{Cost of Goods Sold} \\ \$1,000 & & + \$2,200 & & - \$1,550 & & = \underline{\underline{\$1,650}} \end{array}$$

Thus purchasing additional units has increased cost of goods sold by \$40 (\$1,650 – \$1,610) even though unit sales remain unchanged. **It is inconsistent with the revenue recognition principle for income to be affected by the purchasing activities of a company**, but it is an inevitable result of the LIFO method. The FIFO and average cost methods do not produce unusual results when inventory liquidation occurs, nor are they as susceptible to earnings management.

Management should make decisions about purchasing or manufacturing inventory on the basis of economic and operating factors. The use of LIFO, however, allows management to influence the company's income through the acceleration of, or delay in, acquiring inventory.

### Inventory Valuation

The LIFO method produces a lower ending (and beginning) inventory value on a company's balance sheet (again assuming rising costs) because the oldest costs remain in this inventory. The recorded amount of this inventory often has little or no relationship to the costs of the current period or to the costs that will be incurred to replace the inventory, and therefore is *not relevant*. This low valuation affects the computation and evaluation of current assets, working capital, total assets, and any financial ratios that include inventory, thereby *reducing comparability* between companies using LIFO and those using FIFO. Furthermore, comparability between two or more companies using LIFO is impaired, because each company's inventory valuation depends on the year in which it adopted LIFO. For example, if companies in the same industry adopted LIFO in different years, each company's LIFO base will include costs of different years. (The year of adoption is *not* a required disclosure.) In addition, if the companies increase their inventories by different amounts in later years, the additional LIFO layers were added at different costs.

Therefore, a user evaluating a company that uses LIFO should always convert the inventory to nonLIFO (FIFO or average) amounts. As we show later, a company that uses LIFO and files with the SEC must disclose the nonLIFO value of its inventory.

The FIFO method produces a higher ending inventory value on the balance sheet (assuming rising costs) because it includes the most recent costs. This value approximates the costs that will be incurred to replace the inventory, but how closely depends on when the purchases included in the ending inventory were made and how fast costs are rising. Therefore, the FIFO inventory value is more *relevant*.

### Average Cost

The average cost method is based on the assumption that during the period a company combines all the costs so that the unit costs included in cost of goods sold are the same as those remaining in inventory. Thus the method produces the same cost in a particular period for identical units that have the same utility. The weighted average method treats the accounting period as a single time period and produces the same unit cost for cost of goods sold and ending inventory. The general principle underlying the moving average method is the same, except that the period used is the time between the respective purchases. The same unit cost is used for the sales made in that time period and for the inventory at the end of that period. However, over the total accounting period, the unit costs used for the cost of goods sold vary as each purchase is made, and the unit cost for the ending inventory is the average cost calculated after the last purchase of the period.

The disadvantage of the average cost method is that the average is affected by the costs incurred in previous periods. Although the influence from these past periods becomes minimal as time passes, it still means that the average cost does not reflect the actual costs paid, either for the units sold or for those held in inventory in the current period.

## LINK TO ETHICAL DILEMMA

As the CFO of a large manufacturing company, you realize that, although the company performed well over the past fiscal year, reported earnings will fall short of analysts' expectations. Knowing that failure to meet these expectations will likely result in a fall in the company's stock price and possibly the loss of your job, you assemble your most trusted financial experts to provide advice as to how to increase earnings. A plan is developed that would:

- Delay all inventory purchases until the next fiscal year (because you are using LIFO, this delay would result in the liquidation of inventory and a corresponding increase in income)
- Implement a sales program that would allow customers who accepted delivery of merchandise in the current year to defer payment for six months (normal practice requires payment within 30 days)

The financial experts all agree that these two actions are acceptable under GAAP and would allow the company to meet its earnings target. Discuss the ethical implications of these actions.

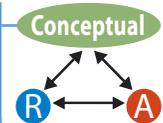

## Management's Selection of an Inventory Cost Flow Assumption

The previous discussion shows that there are many financial accounting and tax issues involved in selecting an inventory cost flow assumption. In most cases, however, the decision should focus on the expected future cost changes.

If a company expects that costs will *rise* for several years, it should select LIFO because, as we discussed earlier, LIFO is a better measure of income. Also the LIFO conformity rule will allow the use of LIFO for income tax reporting and the company will save income taxes. Therefore, the financial reporting rules and the income tax rules are consistent. However, most companies probably consider the tax savings to be more important than the financial reporting issues!

The additional cash that results from the tax savings is reduced because the LIFO method is more costly to use than the FIFO method. These costs result from the additional costs of record keeping and financial statement preparation, such as keeping track of the LIFO layers for each type of inventory and the requirements imposed by the Internal Revenue Service. For a small company, these additional costs may be greater than the income tax savings that would result from the adoption of LIFO. For larger companies, however, the income tax savings are likely to exceed the additional costs (assuming rising prices), as is evidenced by the number of companies that use LIFO (see Exhibit 8-5).

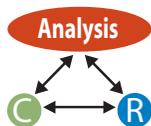

Alternatively, if costs are expected to *fall* for several years, the decision is not as simple. For financial reporting purposes it can be argued that LIFO is still preferable because the most recent (and lowest) costs should be included in cost of goods sold because the inventory can be replaced at those lower costs. However, for income tax purposes, the use of FIFO is preferable because the company pays less income taxes. Although a company

could use LIFO internally and FIFO for income taxes, it is unlikely to do so because of the additional record keeping costs it would incur. Therefore, if a company expects falling costs, it will use FIFO. Unfortunately, this means that income tax considerations are determining the accounting principle used for financial reporting.

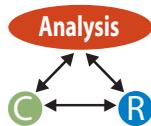

Arguments are made that a company should not adopt LIFO even when its costs are expected to rise. This is because of the lower income that will result and a possible perception that the company is less successful and that its stock price will be lower. However, efficient capital markets research, discussed in Chapter 1, has indicated that stock market prices are *not* affected by the selection of an inventory cost flow assumption. That is, the stock market compensates for the lower reported income under LIFO.

In most situations the FIFO and weighted average *cost* flow assumptions approximate the *physical* flow of the items in inventory, whereas LIFO does not. For example, a retail store will try to impose a FIFO physical flow on its customers by selling the oldest items first. But, the customers may impose more of an average flow on the store by the way they select items from the shelves. However, accounting principles do *not* require that the selected cost flow method approximate the physical flow of goods but only that the method be systematic, based on cost, and match costs and revenues appropriately, as we discussed earlier. Therefore, a company's selection of a cost flow assumption should *not* depend on the perceived physical flow of goods.

Management also may be reluctant to adopt LIFO if the company pays them bonuses on the basis of accounting income. This tends to discourage management from using LIFO in periods of rising costs, since the lower reported income produces lower bonuses. In addition, a higher income results in higher earnings per share and a higher rate of return. These factors are considered important by many users of financial statements. Remember, however, that using a method other than LIFO in periods of rising costs causes the company to pay additional taxes.

There are several additional miscellaneous disadvantages of LIFO that a company should consider before adopting LIFO. First, adopting LIFO could increase its income taxes initially because the income tax rules require that the opening inventory in the year that LIFO is adopted must be stated at cost. Therefore, if the inventory previously had been written down to a market value lower than cost for income tax purposes (as we discuss in Chapter 9), it would be necessary to write the inventory back up and pay additional taxes on that amount. Second, the use of LIFO might also cause a company to be limited in its *financial flexibility*, because of covenants included in its bond indentures or other borrowing agreements. For example, the company might be required to maintain a certain current ratio or debt-to-equity ratio. Finally, the use of LIFO might cause a company to be less concerned about controlling the level of its inventories because of the company's lower *apparent* investment in those inventories.

Many manufacturing companies that expect falling costs use the average cost flow assumption in their financial statements. A company uses this method because (1) it operates a standard cost system (discussed in a cost accounting book) for its budgeting and control, and (2) it is unlikely to result in significantly more income taxes than FIFO.

## SECURE YOUR KNOWLEDGE 8-2

- Because a company carries inventory and the cost of the inventory changes during a period, it uses a cost flow assumption to assign costs to the physical units in ending inventory and cost of goods sold.
- The specific identification cost flow assumption (under which the company identifies the actual cost of each unit in ending inventory and cost of goods) is appropriate for perpetual inventory systems in which each item is unique.

(continued)

- The FIFO cost flow assumption (under which the company includes the earliest costs in costs of goods sold and the most recent costs in ending inventory) is generally viewed as providing a more relevant inventory valuation and a better approximation of the physical flow of inventory compared to LIFO.
- The LIFO cost flow assumption (under which the company includes the most recent costs in costs of goods sold and the earliest costs in ending inventory) is generally viewed as providing both a more relevant measure of income when costs are rising, as well as tax benefits. However, it is more susceptible to income distortions because of inventory liquidations or management of inventory quantities.
- The average cost flow assumption (under which the company combines all costs and units and applies a weighted average cost to both ending inventory and cost of goods sold) produces income measures and inventory valuations that fall between the FIFO and LIFO values and is often used by manufacturers.

## DOLLAR-VALUE LIFO

The dollar-value LIFO method follows the same cost flow assumption as the LIFO method, but it overcomes three difficulties involved in applying the simple LIFO approach.

First, the LIFO method requires a company to keep numerous detailed records. As with other methods, the company must record the physical quantities of each item in its inventory from either a physical count or the perpetual inventory records. Then, it must apply unit costs from the years since it adopted LIFO, in the LIFO order. Finally, it must correctly account for the liquidations in LIFO inventory that occurred over the years.

Second, fluctuations in the physical quantities of similar inventory items may occur. For example, the quantity of one inventory item may significantly decline during a period causing a partial liquidation of its LIFO layers, whereas the quantity of a very similar inventory item may increase. As these fluctuations occur over time, the LIFO layers for each individual item would be reduced, thereby removing many of the advantages of LIFO.

Third, as technological changes take place, inventory made with one material is replaced by inventory made with substitute materials, or an outdated design is replaced by a newer design. Strict application of the LIFO method would require a company to start a new LIFO base for the new inventory item, and as the old item is phased out to reduce its inventory to zero. This would eliminate the advantages of LIFO built up in previous periods. With the rate of technological change in many industries, the advantages of LIFO would be lost.

Dollar-value LIFO overcomes part of the first problem by the use of *current costs* and *cost indexes*, and the second and third problems by the use of *inventory pools*. Under the dollar-value LIFO method, a company may group the inventory into pools that are similar as to types of material or use. Some companies may consider their entire inventory as one pool, but usually several pools are used. We discuss cost indexes and inventory pools in more detail later in the chapter.

The general principle of the dollar-value LIFO method is that a company initially values its ending inventory at current cost and “rolls back” this cost to the cost at the beginning of the base year (the year in which it adopted LIFO) to *eliminate the change in costs* from the physical quantity of the ending inventory. A comparison of the year’s beginning and ending inventory at base-year costs indicates whether there has been a real increase (or decrease) in the physical quantity of the inventory. The company “rolls forward” the increase (or decrease) to the appropriate current cost level, and adds this layer of current cost (or subtracts it from) the beginning inventory to determine its ending inventory. The application of the dollar-value LIFO method requires the four steps we show in Exhibit 8-4.

It is necessary to convert the inventory to base-year costs in order to isolate the *quantity* increase from the *cost* increase. To show that a comparison of base-year *costs* reflects changes in *quantity*, consider the following two simplified examples. First, assume a company has a beginning inventory of 100 units at \$20 each, or \$2,000, when it adopts

7 Understand dollar-value LIFO.

**EXHIBIT 8-4 Dollar-Value LIFO Calculation Steps**

Step 1. Value the total ending inventory at current-year costs.

Step 2. Convert (roll back) the ending inventory cost to base-year costs by applying the base-year conversion index:

$$\text{Ending Inventory at Base-Year Costs} = \text{Ending Inventory at Current-Year Costs} \times \frac{\text{Base-Year Cost Index}}{\text{Current Cost Index}}$$

Step 3. Compute the change in the inventory level (physical quantity) for the year at base-year costs by comparing the ending inventory at base-year costs with the beginning inventory at base-year costs.

Step 4. a. If there is an increase in the inventory level at base-year costs, there has been a real *increase* in the physical quantity of the inventory over the year. Convert (roll forward) this increase to current-year costs by applying the current-year conversion index:

$$\text{Layer Increase at Current-Year Costs} = \text{Increase at Base-Year Costs} \times \frac{\text{Current Cost Index}}{\text{Base-Year Cost Index}}$$

The ending inventory cost is the dollar-value LIFO inventory cost at the beginning of the year *plus* the layer increase at current-year costs.

b. If there is a decrease in the inventory level at base-year costs, there has been a real decrease in the physical quantity of the inventory over the period. This decrease reduces the inventory on a LIFO layer basis, and therefore it must be converted to the costs of the most recently added layer or layers:

$$\text{Decrease at Costs of Most Recently Added Layer(s)} = \text{Decrease at Base-Year Costs} \times \frac{\text{Cost Index of Most Recently Added Layer(s)}}{\text{Base-Year Cost Index}}$$

The ending inventory cost is the dollar-value LIFO cost at the beginning of the year *minus* the decrease at the costs of the most recently added layer(s). Note that the decrease may eliminate more than one layer of LIFO inventory, and therefore the decrease at base-year costs has to be converted to the costs of as many layers as is necessary to eliminate the total decrease.

dollar-value LIFO. At the end of the year, it has an ending inventory of 100 units at a current cost of \$21 each, or \$2,100. It might appear from a simple comparison of the two costs (\$2,100 versus \$2,000) that the *physical quantity* of the inventory has increased. However, this is not the case. The quantity has remained unchanged, and the cost change (from \$20 to \$21 per unit, or an increase of 5%) has accounted for the entire change in the cost of the inventory. Reducing the inventory of \$2,100 to the base-year costs gives an amount of \$2,000 [ $\$2,100 \times (100 \div 105) = \$2,000$ ]. Since the beginning and ending inventory amounts are \$2,000 when they are both measured in terms of the same costs (base year), there has been no increase in quantity. The increase from \$2,000 to \$2,100 resulted solely from the increase in costs.

In the second example, we can isolate the quantity increase from the cost increase without knowing the number and costs of the units. To illustrate, assume a company has a beginning inventory of \$1,000 and a cost index (discussed later) of 100 when it adopted dollar-value LIFO. Assume further that the ending inventory at current cost is \$1,430 and costs have increased 10%. That is, the cost index is 110 ( $100 \times 1.10 = 110$ ). The quantity increase in the inventory is not 43% ( $\$1,430 \div \$1,000 = 1.43$ ). Rather, the ending inventory at base-year costs is \$1,300 [ $\$1,430 \times (100 \div 110) = \$1,300$ ], and therefore inventory has increased in quantity by 30% ( $\$1,300 \div \$1,000 = 1.30$ ). The total increase of 43% in the cost of the inventory is made up of an increase in the quantity of 30% and a cost increase of 10% ( $1.30 \times 1.10 = 1.43$ ). To complete the example, the increase in inventory of \$300 at base-year costs is converted to ending costs of \$330 [ $\$300 \times (110 \div 100)$ ], and therefore the LIFO ending inventory is valued at \$1,330 ( $\$1,000 + \$330$ ).

**Example: Dollar-Value LIFO**

We show how to apply the four steps discussed in Exhibit 8-4 for the Wagner Company using the basic data in Example 8-11. The Wagner Company adopted LIFO at the beginning

of 2006 and has taken an ending inventory at the *current costs* for each year as indicated. In addition, the company has experienced yearly changes in the level of its costs as indicated by its cost index for each year. (We discuss the determination of a cost index later.)

**EXAMPLE 8-11** Data for Wagner Company

Date	Ending Inventory at Current Costs	Cost Index
January 1, 2006	\$10,000	100
December 31, 2006	12,100	110
December 31, 2007	13,125	125
December 31, 2008	16,800	140
December 31, 2009	12,360	120

We show the calculation of the dollar-value LIFO ending inventory in Example 8-12. The base year is 2006, so the beginning inventory needs no adjustment. The 2006 ending inventory at the current cost of \$12,100 is reduced to \$11,000 at base-year costs. Therefore, the real (quantity) increase in inventory is \$1,000 (\$11,000 – \$10,000 at base-year costs), which is \$1,100 [ $\$1,000 \times (110 \div 100)$ ] in 2006 costs. The ending LIFO inventory cost for 2006 is \$11,100, which is made up of two layers, the base layer of \$10,000 plus the layer added in 2006 of \$1,100.

In 2007, the company reduces its ending inventory of \$13,125 at the current cost to \$10,500 at base-year costs. This indicates a real (quantity) *decrease* in inventory of \$500 (the \$10,500 2007 ending inventory less the \$11,000 2006 ending inventory, *both* at base-year costs). The company subtracts the decrease from the most recently added layer, which is the layer added in 2006. Therefore it converts the decrease of \$500 in base-year costs to 2006 costs and *not* to 2007 costs. Consequently it applies the 110 cost index to the \$500 decrease, resulting in a decrease of \$550 in terms of 2006 costs and an ending inventory of \$10,550.

In 2008, the company has an increase in inventory at base-year costs, and therefore adds another layer, so that its ending LIFO inventory of \$12,650 consists of three layers.

In 2009, the company has a decrease in its cost index. It calculates the ending inventory at base-year costs in exactly the same manner as we discussed previously. In this case the \$10,300 ending inventory at base-year costs is \$1,700 lower than the \$12,000 beginning inventory at base-year costs. This completely eliminates the layer of \$1,500 (at base-year costs) added in 2008, and so the company must go back into the 2006 layer to account for the remaining decrease of \$200 at base-year costs (no layer was added in 2007). The ending LIFO inventory of \$10,330 consists of the base inventory plus the remainder of the layer added in 2006. ♦

## Determination of Cost Index

The preceding discussion refers to the use of a cost index rather than a price index. A **cost index** refers to an internally generated index that is specific to a company's particular inventory, whereas a **price index** is a more general index prepared by an external organization, such as a government or trade association. Although the concepts underlying the two are identical, we use the term *cost index* because IRS regulations require that in most situations a company use an internally developed index specific to the company's particular operations. However, the IRS has simplified the LIFO method by allowing the use of published price indexes in certain situations.

**EXAMPLE 8-12 Dollar-Value LIFO Inventory Calculations**

Date	Step 1		×	Step 2		=	Step 3		×	Step 4		Ending Inventory at LIFO	Layers in LIFO Ending Inventory
	Ending Inventory at Current Costs	$\frac{\text{Base-Year Cost Index}}{\text{Current Cost Index}}$		Inventory at Base-Year Costs	Increase (Decrease) at Base-Year Costs		Relevant Cost Index Base-Year Cost Index	Increase (Decrease) at Relevant Current Costs					
1/1/06					\$10,000		—	—		—	\$10,000	\$10,000	
12/31/06	\$12,100	$\frac{100}{110}$	×		11,000	=	\$1,000	$\frac{110}{100}$	×	\$1,100	=	11,100	{ 10,000 (\$10,000 @ 100) 1,100 (\$1,000 @ 110)
12/31/07	13,125	$\frac{100}{125}$	×		10,500	=	(500)	$\frac{110}{100}$	×	(550)	=	10,550	{ 10,000 (\$10,000 @ 100) 550 (\$500 @ 110)
12/31/08	16,800	$\frac{100}{140}$	×		12,000	=	1,500	$\frac{140}{100}$	×	2,100	=	12,650	{ 10,000 (\$10,000 @ 100) 550 (\$500 @ 110) 2,100 (\$1,500 @ 140)
12/31/09	12,360	$\frac{100}{120}$	×		10,300	=	(1,500) (200)	$\frac{140}{100}$ $\frac{110}{100}$	×	(2,100) (220)	=	10,330	{ 10,000 (\$10,000 @ 100) 330 (\$300 @ 110)

If a company uses an internally developed cost index, it must compute an index based on the particular cost per unit it has experienced in the current year as compared to the base year. Typically, the company prepares the index using a sample of its total inventory. Two methods to compute the cost index are used in practice: the double-extension method and the link-chain method.

Under the **double-extension** method, a sample of the ending inventory is priced at current-year costs and at base-year costs, and the cost index is computed as follows:

$$\text{Cost Index} = \frac{\text{Sample of Ending Inventory at Current-Year Costs}}{\text{Sample of Ending Inventory at Base-Year Costs}} \times 100$$

This is known as the double-extension method because the ending inventory is priced and “extended” twice—once at current costs and once at base-year costs. The double-extension method is appropriate for companies that have little change in the characteristics of their inventory items. When changes are frequent, determination of base-year costs for new items is difficult. For example, if a company adopted LIFO in 1990 and develops a new product in 2007, the double-extension method would require the computation of the cost in 1990 of the new product. Since the product, perhaps including the technology, did not exist in 1990, the difficulties of such a calculation are obvious. In such situations the link-chain method should be used.

Under the **link-chain** method, a company prices a sample of the ending inventory at current costs for the current year and for the previous year, and therefore the method avoids the problems of the double-extension method we just discussed. The ratio of the current-year current cost to the previous-year current cost is used to compute a cost index for the *year*. This index is multiplied by the cost index carried forward from the previous year to determine the current year cumulative index as follows:

$$\text{Cost Index} = \frac{\text{Sample of Ending Inventory at Current-Year Costs}}{\text{Sample of Ending Inventory at Previous-Year Costs}} \times \text{Previous-Year Cost Index}$$

## Inventory Pools

As we discussed earlier in the chapter, a company may use inventory pools in conjunction with dollar-value LIFO. The purpose of the pools is to maintain the benefits from using LIFO when fluctuations in the physical quantities of similar inventory items occur and when technological change takes place.

To illustrate the concept of an inventory pool, consider the Herrmann Soup Company, which adopts dollar-value LIFO on January 1, 2007 using a single pool. The pool includes three types of soup that the company manufactures, and we show the calculation of the total cost of the beginning inventory in Example 8-13. The company assigns a cost index of 100 to the beginning inventory and uses it as the base for calculating the cost index in later years.

### EXAMPLE 8-13 Herrmann Soup Company Inventory, January 1, 2007

Type	Quantity	Cost per Unit	Total Cost
Mushroom	10,000	\$0.25	\$2,500
Vegetable	8,000	0.20	1,600
Tomato	22,000	0.16	3,520
	<u>40,000</u>		<u>\$7,620</u>

During 2007, the transactions we show in Example 8-14 occurred. The company purchased 150,000 cans of soup and sold 139,000 cans, leaving 51,000 cans in ending inventory, including the quantities of each type as shown. Using the double-extension method, the company calculates a cost index of 107 for the ending inventory by dividing the ending inventory at current-year costs by the ending inventory at base-year costs. Completing the remaining steps in the dollar-value LIFO calculations results in an ending inventory at LIFO cost of \$10,167, as we show in Example 8-14.

#### EXAMPLE 8-14 Inventory Pools

##### Purchases and Sales During 2007

Type	Beginning Quantity	Quantity Purchased	Cost per Unit	Quantity Sold	Inventory Quantity December 31, 2007
Mushroom	10,000	60,000	\$0.30	54,000	16,000
Vegetable	8,000	40,000	0.24	38,000	10,000
Tomato	22,000	50,000	0.14	47,000	25,000
	<u>40,000</u>	<u>150,000</u>		<u>139,000</u>	<u>51,000</u>

$$\begin{aligned}
 \text{Cost Index} &= \frac{\text{Ending Inventory at Current-Year Costs}}{\text{Ending Inventory at Base-Year Costs}} \times 100 \\
 &= \frac{(16,000 \times \$0.30) + (10,000 \times \$0.24) + (25,000 \times \$0.14)}{(16,000 \times \$0.25) + (10,000 \times \$0.20) + (25,000 \times \$0.16)} \times 100 \\
 &= \frac{\$10,700}{\$10,000} \times 100 \\
 &= 107
 \end{aligned}$$

##### LIFO Cost of Ending Inventory

$$\begin{aligned}
 \text{Ending Inventory at Base-Year Costs} &= \text{Ending Inventory at Current-Year Costs} \times \frac{\text{Base-Year Cost Index}}{\text{Current Cost Index}} \\
 &= \$10,700 \times \frac{100}{107} \\
 &= \$10,000
 \end{aligned}$$

$$\begin{aligned}
 \text{Increase in Inventory at Base-Year Costs} &= \text{Ending Inventory at Base-Year Costs} - \text{Beginning Inventory at Base-Year Costs} \\
 &= \$10,000 - \$7,620 \\
 &= \$2,380
 \end{aligned}$$

$$\begin{aligned}
 \text{Layer Increase at Current-Year Costs} &= \text{Increase at Base-Year Costs} \times \frac{\text{Current Cost Index}}{\text{Base-Year Cost Index}} \\
 &= \$2,380 \times \frac{107}{100} \\
 &= \$2,547 \text{ (rounded)}
 \end{aligned}$$

$$\begin{aligned}
 \text{Total LIFO Ending Inventory Cost} &= \$7,620 + \$2,547 \\
 &= \underline{\underline{\$10,167}}
 \end{aligned}$$

The preceding discussion assumed that the entire ending inventory cost was a single inventory “pool.” When a company uses the dollar-value LIFO method, however, it may include the inventory in one or several “inventory pools.” IRS regulations do not specify what types of items are to be included in the same pool, other than to say they should be “substantially similar.” If a company uses more than one pool, it must compute a separate cost index for each (or a representative sample of the pool). In general, the fewer the pools and the more items included in each pool, the more likely it is that increases in some items will offset decreases in other items in the pool, thereby avoiding the liquidation of LIFO layers and the loss of the tax benefits of LIFO. In other words, a company would typically prefer to have the fewest number of pools allowed. In a surprising decision several years ago, **Stauffer Chemical Company**

increased its LIFO pools from 8 to 280, which increased its income by \$16.5 million (and resulted in additional taxes being paid).

Note also that the current cost used in the dollar-value LIFO calculations can be the cost of the first purchases in a year, the last purchases in a year, or the average cost of all purchases during the year as assumed in the preceding example. Once a choice is made, however, it must be applied consistently.

## ADDITIONAL LIFO CONSIDERATIONS

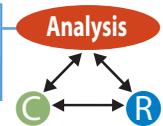

Several other items concerning LIFO are important, including the LIFO valuation adjustment, interim statements using LIFO, a change to or from LIFO, and international accounting differences. We discuss these topics in the following sections.

### LIFO Valuation Adjustment

Frequently, a company uses LIFO for external financial reporting and income tax purposes but uses another method for internal management. In this case, the company makes a valuation adjustment to convert its internally reported ending inventory to LIFO for external reporting. This adjustment increases (decreases) cost of goods sold for the period and decreases (increases) the ending inventory by the amount of the *change* in the difference between the beginning and ending inventories under the two methods. However, the company usually does not adjust the inventory account directly. Instead, it uses a valuation adjustment. This adjustment has a variety of names including *Valuation Allowance* or (inappropriately) *LIFO Reserve*. Typically, this adjustment is not part of the company's formal accounting system, but the company does report the amount in its balance sheet or its notes because the SEC requires the disclosure. When this occurs, the company subtracts the *cumulative* balance of the adjustment to report the ending inventory at LIFO. We illustrate this situation with the disclosures of **General Mills** and **Marathon Oil** in Real Report 8-1 later in the chapter.

You should also note that the *change* in the adjustment for the year is the difference between the LIFO cost of goods sold and what the cost of goods sold would have been under the method used internally (FIFO or average). A user can use this change to adjust the cost of goods sold of a company using LIFO to the other method, which improves the comparability of the two companies. The *total* amount of the adjustment is the cumulative difference between the two cost of goods sold amounts since LIFO was adopted. Multiplying this amount by the income tax rate gives the cumulative savings in income tax expense, while multiplying the amount by the after-tax rate gives the cumulative effect on income.

8 Explain additional LIFO issues.

### Interim Statements Using LIFO

If a company uses LIFO for annual reporting purposes, it must use LIFO for interim (i.e., quarterly) reporting purposes (discussed in Chapter 5). **APB Opinion No. 28** states that if a company using LIFO has an inventory liquidation at an interim date that it expects to replace by the end of the annual period, it does not include the LIFO liquidation in its inventory, and its cost of sales includes the expected cost of replacement of the liquidated LIFO inventory.<sup>6</sup>

Consequently, when a company has an inventory liquidation at the end of a quarter, it must forecast its year-end physical quantities. If the forecast indicates that the company will not liquidate any inventory at the end of the year, it removes the effect of the LIFO liquidation from the interim financial statements. The company decreases the inventory value and increases the cost of goods sold by the difference between the replacement cost and the LIFO cost for the number of units that it has liquidated. If the forecast indicates that the liquidation will still exist at the end of the year, the company includes the effect of the LIFO liquidation in its interim financial statements.

6. "Interim Financial Reporting," *APB Opinion No. 28* (New York: AICPA, 1973), par. 14(b).

# 1 3

## LINK TO RATIO ANALYSIS

Analysts often use financial ratios such as inventory turnover and average days in inventory to evaluate the effectiveness of a company's inventory management and control activities. It is important to note that the accounting choice between FIFO and LIFO can have a significant impact on this evaluation since each method will produce different income statement and balance sheet amounts. Therefore, it would not be useful to compare companies that make different accounting choices without first adjusting for these differences. Fortunately, the disclosure of the "LIFO reserve" allows the following adjustments to be made:

$$\text{FIFO Inventory} = \text{LIFO Inventory} + \text{LIFO Reserve}$$

$$\text{FIFO Cost of Goods Sold} = \text{LIFO Cost of Goods Sold} - \text{Increase (or + Decrease) in LIFO Reserve}$$

Using amounts obtained from General Mills' annual report, we show this conversion below:

	2004	2003
Inventory (as reported, LIFO)	\$ 1,063	\$ 1,082
Add: LIFO Reserve	+ 41	+ 27
Inventory (FIFO)	<u>\$ 1,104</u>	<u>\$ 1,109</u>
Cost of Sales (as reported)	\$ 6,584	
Less: Increase in LIFO Reserve	- 14	
Cost of Sales (FIFO)	<u>\$ 6,570</u>	

With these adjustments, you can now perform an appropriate analysis.

### Change to or from LIFO

Although the adoption of an inventory cost flow assumption is a long-term decision, a company may occasionally change its method. When the company changes *to* LIFO from another method, usually the effect on the results of prior periods is not determinable.

Then *FASB Statement No. 154* requires that the company apply the change prospectively, as of the earliest date practicable. A company that changes to another method *from* LIFO retroactively restates the results of prior periods and treats the change as a retrospective adjustment.<sup>7</sup> We discuss these changes in Chapter 23.

## LINK TO INTERNATIONAL DIFFERENCES

International accounting standards for inventories also require a company to base its inventory values on cost. However, the IASB does not allow the use of LIFO because it is clearly inconsistent with any presumed physical flow of the inventory, an issue that has not been considered relevant for U.S. accounting principles. Also, LIFO is not permitted to be used for income tax purposes in most countries and, therefore, there has been no incentive to allow its use for financial reporting.

7. "Accounting Changes and Error Corrections," *FASB Statement No. 154* (Norwalk, Conn.: 2005), par. 7–9.

### SECURE YOUR KNOWLEDGE 8-3

- Dollar-value LIFO was developed to overcome practical difficulties with the application of LIFO.
- The calculation of a cost index is necessary to convert the inventory to base-year costs so that *quantity* increases (decreases) may be isolated from *cost* increases (decreases).
- Inventory is often included in one or more inventory pools to keep the advantages of LIFO when there are fluctuations in the physical quantities of similar products and/or technological change.
- For a company that uses LIFO for financial reporting purposes but an alternative cost flow assumption for internal management, a LIFO valuation adjustment is necessary to convert the internally reported ending inventory to a LIFO basis.
- If a company has a LIFO liquidation in an interim reporting period but expects to replace the inventory by year-end, the impact of the liquidation is removed from its interim financial statements.

## DISCLOSURE OF INVENTORY VALUES AND METHODS

Exhibit 8-5 shows the relative use of alternative inventory methods by 600 surveyed companies and the proportion of the inventory cost determined by LIFO. The trend to the use of LIFO between 1973 and 1982 is clearly indicated, although the trend has reversed somewhat with the lower inflation since then. There were more than 600 responses to the methods used, since many companies use more than one method, as indicated by the categories listed in the second section.

9 Understand inventory disclosures.

EXHIBIT 8-5 Inventory Cost Determination											
Methods	Number of Companies										
	2003	2000	1997	1994	1991	1988	1985	1982	1979	1976	1973
First-in, first-out (FIFO)	384	386	415	417	421	396	381	373	390	389	394
Last-in, first-out (LIFO)	251	283	326	351	361	379	402	407	374	331	150
Average cost	167	180	188	192	200	213	223	238	241	232	235

<b>Use of LIFO</b>											
All inventories	26	23	17	17	23	20	26	28	20	9	8
50% or more inventories	120	148	170	186	186	207	231	206	194	167	49
Less than 50% of inventories	77	82	99	98	95	90	83	88	94	84	78
Not determinable	28	30	40	50	57	62	62	85	66	71	25

Source: *Accounting Trends and Techniques* (New York: AICPA, 1974, 1977, 1980, 1983, 1986, 1989, 1992, 1995, 1998, 2001, and 2004).

Real Report 8-1 shows examples of the way in which three companies disclose the methods used for inventory. Companies are required to disclose the inventory method, or methods, used. **Marathon Oil** reports a single inventory amount in the balance sheet and shows the breakdown in the notes to the financial statements. It categorizes its inventory by functional groups, while **General Mills** categorizes its inventory by type and product.

Hewlett-Packard uses FIFO, while General Mills uses LIFO in the United States and FIFO elsewhere. Marathon Oil discloses the difference between LIFO costs and current costs.

### Real Report 8-1 Examples of Disclosure of Inventory Values and Methods

#### HEWLETT-PACKARD COMPANY

(millions)

##### Balance Sheet

Assets (in part)	October 31, 2004	October 31, 2003
Inventory	\$7,071	\$6,065

##### Notes to Consolidated Financial Statements (in part)

Note 1 Summary of Significant Accounting Policies (in part)

*Inventory*—Inventory is valued at the lower of cost or market, with cost computed on a first-in, first-out basis.

#### GENERAL MILLS, INC.

##### Notes to Consolidated Financial Statements (in part)

Note 1 Summary of Significant Accounting Policies (in part)

*C. Inventories.* Inventories are valued at the lower of cost or market. We generally use the LIFO method of valuing inventory because we believe that it is a better match with current revenues. However, FIFO is used for most foreign operations, where LIFO is not recognized for statutory purposes.

Note 6 Inventories

The components of inventories are as follows:

In Millions	May 30, 2004	May 25, 2003
Raw materials, work in process and supplies	\$ 234	\$ 221
Finished goods	793	818
Grain	77	70
Reserve for LIFO valuation method	(41)	(29)
Total inventories	\$1,063	\$1,082

At May 30, 2004 and May 25, 2003, respectively, inventories of \$765 million and \$767 million were valued at LIFO. LIFO accounting decreased fiscal 2004 earnings by \$0.02 per share and had a negligible impact on fiscal 2003 and 2002 earnings. Results of operations were not materially affected by a liquidation of LIFO inventory. The difference between replacement cost and the stated LIFO inventory value is not materially different from the reserve for LIFO valuation method.

#### MARATHON OIL

##### Notes to Financial Statements (in part)

Note 12. Inventories

(In millions) December 31	2004	2003
Liquid hydrocarbons and natural gas	\$ 676	\$ 674
Refined products and merchandise	1,192	1,151
Supplies and sundry items	129	130
Total	<u>1,995</u>	<u>1,955</u>

The LIFO method accounted for 92 percent and 91 percent of total inventory value at December 31, 2004 and 2003. Current acquisition costs were estimated to exceed the LIFO inventory values at December 31, 2004 and 2003, by approximately \$1,294 million and \$655 million. Cost of revenues was reduced and income from operations was

*Continued*

increased by \$4 million in 2004 and \$11 million in 2003 and less than \$1 million in 2002 as a result of liquidations of LIFO inventories.

### Questions

1. Why do you think Hewlett-Packard uses FIFO while General Mills uses LIFO?
2. Why does General Mills use LIFO in the United States and FIFO elsewhere?
3. If the inventory costs of General Mills are rising throughout the world, what is the effect on the financial statements of its use of FIFO?
4. How would you explain the meaning of General Mills' disclosure about the impact of LIFO accounting to a shareholder?
5. For Marathon Oil, how would you explain the statement that the LIFO liquidation increased income from operations?

## 1 3

### LINK TO RATIO ANALYSIS

Effective inventory management and control is a critical ingredient to a company's success. While management wants to keep an adequate supply of inventory on hand to meet customer demands and maintain desired service levels, there is a cost associated with carrying high levels of inventory (e.g., storage costs, risk of obsolescence, damage, theft, insurance, and taxes). Unfortunately, reducing costs by reducing inventory levels can also have adverse consequences such as lost sales, stockouts, and dissatisfied customers. Companies use a variety of tools, such as computerized inventory tracking systems, to manage and control their inventories. The effectiveness of an inventory management program can be evaluated using financial ratios such as inventory turnover and average days in inventory.

Using data obtained from the company's annual report, the computation of inventory turnover ratios for **General Mills** and **ConAgra** are shown below:

(amounts in millions)	<b>General Mills</b>		<b>ConAgra</b>	
	2004	2003	2004	2003
Cost of Goods Sold (assuming FIFO)	\$6,570		\$11,326.1	
Inventories (on FIFO basis)	\$1,104	\$1,109	\$2,625.6	\$2,455.6

$$\text{General Mills: Inventory Turnover} = \frac{\$6,750}{\left(\frac{\$1,104 + \$1,109}{2}\right)} = 5.94$$

$$\text{ConAgra: Inventory Turnover} = \frac{\$11,326.1}{\left(\frac{\$2,625.6 + \$2,455.6}{2}\right)} = 4.46$$

Dividing the turnover ratio into 365 days shows that General Mills and ConAgra hold inventory an average of 61.45 and 81.84 days, respectively. The industry average, obtained from **Thomson Analytics** is approximately 61 days. Because higher inventory turnover ratios generally signal more effective inventory management and control, General Mills appears to manage and control its inventory better than ConAgra; however, there is still room for improvement since General Mills' inventory turnover is approximately average for the industry.

## APPENDIX: FOREIGN CURRENCY TRANSACTIONS INVOLVING INVENTORY

### 10 Record foreign currency transactions involving inventory.

Many U.S. companies conduct inventory transactions with customers and suppliers in foreign countries. Sometimes the transaction is expressed in U.S. dollars. For example, most purchases and sales of crude oil are expressed in terms of the U.S. dollar. In these situations there is no accounting issue. For example, if a U.S. oil company purchases 10,000 barrels of crude oil from Saudi Arabia, the price is quoted in dollars and not in the equivalent amount of riyals. If the price is \$50 per barrel, the company records a purchase of inventory and the related payment of \$500,000 ( $\$50 \times 10,000$ ).

In many situations, however, the transaction is expressed in terms of the foreign currency. In these cases the company must record the transaction in U.S. dollars. Therefore, it converts the foreign currency amount into dollars at the exchange rate on the day of the transaction. Exhibit 8-6 shows selected foreign exchange rates. For example, suppose a U.S. company purchases inventory of electronic components from a Japanese company for 50 million yen (¥) when the exchange rate is \$0.008 (1 yen = \$0.008). If the U.S. company pays cash of \$400,000 ( $\text{¥}50,000,000 \times \$0.008$ ) on the same day to purchase yen to settle the transaction, the U.S. company records the transaction as follows:

Inventory (or Purchases)	400,000	
Cash		400,000

**EXHIBIT 8-6 Selected Foreign Exchange Rates**

Currency (Country)	Price in U.S. dollars*
Pound (Britain)	\$1.81
Dollar (Canada)	0.83
Euro	1.25
Shekel (Israel)	0.22
Yen (Japan)	0.0091
Peso (Mexico)	0.09
Riyal (Saudi Arabia)	0.27
Franc (Switzerland)	0.80

\*Note that the exchange rates are stated in terms of \$ per unit of foreign currency. Exchange rates are often stated in terms of units of foreign currency per \$.

Source: *The Wall Street Journal* (August 12, 2005).

More often, transactions between companies in different countries involve credit terms. This allows time for processing the order and payment across international borders. In addition, currency exchange rates change continuously. As a result, the exchange rate is likely to have changed between the date the U.S. company records a purchase transaction and the date it makes the payment. On the date of the payment, the company records an exchange gain or loss to account for the difference between the purchase price of the inventory and the amount of the payment. **An exchange gain or loss is caused by a change in the exchange rate between the date of a purchase or sale on credit and the date of the payment or receipt.** More specifically, when exchange rates are stated in terms of \$ per unit of foreign currency, exchange gains and losses occur for purchases or sales on credit as follows:

1. An exchange *gain* occurs when the exchange rate *declines* between the date a company records a *payable* from a purchase of inventory and the date of the cash *payment*.

2. An exchange *gain* occurs when the exchange rate *increases* between the date a company records a *receivable* from a sale of inventory and the date of the cash *receipt*.
3. An exchange *loss* occurs when the exchange rate *increases* between the date a company records a *payable* from a purchase of inventory and the date of the cash *payment*.
4. An exchange *loss* occurs when the exchange rate *declines* between the date a company records a *receivable* from a sale of inventory and the date of the cash *receipt*.

### Example: Exchange Gain

We first illustrate an exchange gain that occurs when the exchange rate declines between the date a company records a credit purchase of inventory and the date of the cash payment. Suppose that in the preceding example the U.S. company made the purchase of the electronic components on credit. Because the company purchased the inventory when the exchange rate was \$0.008, it records the acquisition as follows:

Inventory	400,000	
Accounts Payable		400,000

The Japanese company has a right to receive 50 million yen, and the U.S. company is obligated to pay sufficient dollars that will convert to 50 million yen on the date that the payment is made. Now assume that the exchange rate on the date of payment is \$0.0078 (1 yen = \$0.0078). In this case, since only \$0.0078 now is needed to buy 1 yen, the U.S. company will have to pay fewer dollars to buy 50 million yen. That is, the yen has become less expensive. More specifically, the U.S. company has to pay only \$390,000 ( $¥50,000,000 \times \$0.0078$ ). Therefore, the company has incurred an exchange *gain* of \$10,000 ( $\$400,000 - \$390,000$ ), which it records at the time of payment for the inventory as follows:

Accounts Payable	400,000	
Cash		390,000
Exchange Gain		10,000

The exchange gain occurs because the U.S. company has to pay only \$390,000 to settle its credit purchase originally recorded at \$400,000. The gain can also be computed by multiplying the amount owed by the change in the exchange rate [ $¥50,000,000 \times (\$0.008 - \$0.0078) = \$10,000$ ]. Remember that the Japanese company still receives 50 million yen; it is the U.S. company that has the exchange gain. ♦

### Example: Exchange Loss

We now illustrate an exchange loss that occurs when the exchange rate declines between the date a company records a credit sale and the date of the cash receipt. Suppose that a U.S. company sells computer equipment to a German company on credit and agrees to a price of 300,000 euros rather than a price in dollars. On the date of the sale, the exchange rate is \$1.20 (1 euro = \$1.20), and therefore the U.S. company records the sale of \$360,000 ( $300,000 \text{ euros} \times \$1.20$ ) as follows (assuming the inventory has a cost of \$200,000):

Accounts Receivable	360,000	
Sales Revenue		360,000
Cost of Goods Sold	200,000	
Inventory		200,000

The German company has an obligation to pay 300,000 euros regardless of the exchange rate on the date of payment. If the exchange rate is \$1.18 when it pays the amount owed, the U.S. company can convert those euros into only \$354,000 (300,000 euros  $\times$  \$1.18). As a result, it has incurred an exchange *loss* of \$6,000 (\$354,000  $-$  \$360,000), which it records at the time of the cash collection as follows:

Cash	354,000	
Exchange Loss	6,000	
Accounts Receivable		360,000

The exchange loss can also be computed by multiplying the amount receivable by the change in the exchange rate [300,000 euros  $\times$  (\$1.20  $-$  \$1.18) = \$6,000]. For financial reporting purposes, the company usually reports the net amount of Exchange Gains and Losses in the Other Items section of its income statement. This amount is included in the income statement because the exchange gains and losses were caused by fluctuations in the exchange rates that resulted in increased or decreased dollar cash flows during the accounting period.

Note that the U.S. company experienced exchange gains and losses in the preceding situations because it agreed to transactions expressed in terms of foreign currencies. Therefore, the U.S. company accepts the risks associated with exchange rate changes. When the transactions are expressed in U.S. dollars, the foreign company accepts, and the U.S. company avoids, the risks associated with exchange rate changes. ♦

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

1. **Describe how inventory accounts are classified.** A retailer needs only one type of inventory account, usually called (merchandise) inventory. A manufacturer typically uses three inventory accounts, usually called raw materials inventory, work in process inventory, and finished goods inventory.
2. **Explain the uses of the perpetual and periodic inventory systems.** A company using a perpetual system keeps a continuous record of the physical quantities in its inventory. A company using a periodic system does not keep a continuous record of the physical quantities (or costs) of inventory on hand.
3. **Identify how inventory quantities are determined.** The basic criterion for including items in inventory is economic control rather than physical possession. Issues include goods shipped FOB shipping point and FOB destination, and goods transferred on consignment.
4. **Determine the cost of inventory.** Inventory cost includes costs directly or indirectly incurred in bringing an item to its existing condition and location. Purchases discounts may be recorded under the gross or net method.
5. **Compute ending inventory and cost of goods sold under specific identification, FIFO, average cost, and LIFO.** Under the specific identification cost flow assumption, a company identifies each unit sold and each unit remaining in the ending inventory, and includes the actual costs of those units in cost of goods sold and ending inventory. Under the FIFO cost flow assumption, a company includes the earliest costs incurred in the cost of goods sold and includes the most recent costs in the ending inventory. Under the average cost flow assumption, a company considers all the costs and units to be combined so that no individual units or costs can be identified. Under the weighted average method, a company computes an average cost for the period. Under the moving average method, a company computes an average cost after each acquisition of inventory. Under the LIFO cost flow assumption, a company includes the most recent costs incurred in the cost of goods sold and includes the earliest costs (including costs incurred in previous periods) in the ending inventory.
6. **Explain the conceptual issues regarding alternative inventory cost flow assumptions.** Conceptual issues include income measurement, income tax effects, liquidation of LIFO layers, earnings (income) management, inventory valuation, average cost, and management's selection of an inventory cost flow assumption.

7. **Understand dollar-value LIFO.** Exhibit 8-4 summarizes the four dollar-value calculation steps.
8. **Explain additional LIFO issues.** Additional LIFO issues include the LIFO valuation adjustment, interim statements using LIFO, a change to or from LIFO, and international accounting differences.
9. **Understand inventory disclosures.** Exhibit 8-5 illustrates the proportion of companies using various methods. Companies must disclose the inventory method, or methods, used. A company using LIFO must disclose the difference between the LIFO and the nonLIFO inventory value.
10. **Record foreign currency transactions involving inventory (Appendix).** A U.S. company records a credit purchase from (or sale to) a company in a foreign country in the usual way. An exchange gain or loss is caused by a change in the exchange rate between the date of the credit purchase (sale) and the date of the payment (receipt). It is recorded as the difference between the accounts payable (receivable) and cash payment (receipt).

## ANSWERS TO REAL REPORT QUESTIONS

### Real Report 8-1 Answers

1. General Mills' choice to use LIFO is appropriate for a company with rising inventory costs and appears to be driven primarily by tax considerations since LIFO will produce lower income amounts in periods of rising prices. Hewlett-Packard, which possesses a much larger inventory balance, uses FIFO, which is consistent with costs that fall over time (or increase very slowly) and results in relevant balance sheet amounts.
2. LIFO is generally not allowed for tax purposes in foreign countries. With this tax advantage eliminated and the fact that LIFO is typically more complex and costly to implement, the benefits of FIFO (higher income and balance sheet amounts in periods of rising prices) most likely outweigh any remaining benefits of using LIFO.
3. Given rising inventory costs, General Mills' decision to use LIFO will result in lower inventory values, earnings, and taxes (assuming the use of LIFO for income tax purposes) relative to FIFO.
4. The use of the LIFO cost flow assumption resulted in increased cash flow for General Mills. While reported earnings decreased \$0.02 per share in the current fiscal year, the company was able to use LIFO for tax purposes, resulting in lower taxable income and increased cash flow. Additionally, if the company was still able to meet analyst expectations of earnings while using LIFO, the use of the LIFO assumption could be interpreted as a positive signal regarding the company's ability to generate future earnings.
5. The majority of Marathon Oil's inventory (92% and 91% at December 31, 2004 and 2003, respectively) is accounted for under the LIFO method which, during periods of rising prices, results in inventory layers with that have lower (noncurrent) costs attached to them. Even though total inventory increased from 2003 to 2004, Marathon Oil sold more inventory than it purchased at some point during the year causing the lower costs in inventory to be expensed. This liquidation of inventory valued at noncurrent costs led to lower cost of revenues (cost of goods sold) and higher income from operations.

## QUESTIONS

- Q8-1** Distinguish among the types of inventory accounts used for merchandising and manufacturing companies.
- Q8-2** What are the cost components of each of the three inventory accounts of a manufacturing company?
- Q8-3** Explain the differences between the perpetual and periodic inventory systems in terms of inventory quantity and cost. Does the use of a perpetual system eliminate the need for taking a physical inventory count?
- Q8-4** What is the general rule used to determine if a company includes an item in inventory? Apply the concept to the accounting for goods in transit and goods on consignment.
- Q8-5** Which of the following items does a manufacturing company include in its inventory account? (a) Goods in transit purchased FOB shipping point, invoice received, (b) Raw materials, (c) Goods out on consignment, (d) Goods in transit sold to Breyer, Inc., shipped FOB destination, (e) Manufacturing supplies.
- Q8-6** Which of these costs does a company include in its inventory cost? (a) Sales commissions, (b) Supervisor's salary, (c) Freight charges, (d) Indirect factory production labor, (e) Storage costs, (f) Corporate executive salaries.
- Q8-7** Discuss the advantages and disadvantages of the two methods of accounting for purchases discounts taken in regard to management's needs, inventory cost, and the valuation of accounts payable.
- Q8-8** What criteria should a company use to decide between alternative inventory cost flow assumptions?

Evaluate the relevance of the LIFO cost flow assumption. Why is LIFO not allowed under international accounting standards?

**Q8-9** During a period of rising costs, indicate whether the LIFO cost flow assumption results in a larger or a smaller net income as compared to the FIFO cost flow assumption and explain why. Explain how a company's net income would compare during a period of falling costs.

**Q8-10** Discuss the cost flow assumptions of the LIFO inventory method. Under what conditions would a company's ending inventory differ under a perpetual and a periodic LIFO system?

**Q8-11** Explain the issue of inventory liquidation when a company uses the LIFO cost flow assumption. Why is this an issue exclusive to LIFO?

**Q8-12** Discuss the LIFO and FIFO cost flow assumptions relative to the issue of holding gains (inventory profits).

**Q8-13** Explain the dollar-value LIFO method of inventory valuation. What are the advantages of dollar-value LIFO as compared to simple LIFO?

**Q8-14** Describe the double-extension and link-chain methods used in dollar-value LIFO and when each should be used.

**Q8-15** When a company changes from FIFO to LIFO, what effect does the change have on its net income and working capital of the current period?

**Q8-16** What is the impact of LIFO inventory liquidation on a company's interim financial statements?

**Q8-17 (Appendix)** Explain what causes an exchange gain or loss and when each occurs.

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

**M8-1** The moving average inventory cost flow method is applicable to which of the following inventory systems?

	Periodic	Perpetual
a.	Yes	Yes
b.	Yes	No
c.	No	No
d.	No	Yes

Questions M8-2 and M8-3 are based on the following data: City Stationers, Inc., had 200 calculators on hand on January 1, 2007, costing \$18 each. Purchases and sales of calculators during the month of January were as follows:

Date	Purchases	Sales
Jan. 12		150 @ \$28
15	100 @ \$20	
27	100 @ \$22	
30		100 @ \$32

City does not maintain perpetual inventory records. According to a physical count, 150 calculators were on hand at January 31, 2007.

**M8-2** The cost of the inventory on January 31, 2007 under the FIFO method is

- a. \$400  
b. \$2,700  
c. \$3,100  
d. \$3,200

**M8-3** The cost of the inventory on January 31, 2007 under the LIFO method is

- a. \$400  
b. \$2,700  
c. \$3,100  
d. \$3,200

**M8-4** Goods on consignment should be included in the inventory of

- a. The consignor but not the consignee  
b. Both the consignor and the consignee  
c. The consignee but not the consignor  
d. Neither the consignor nor the consignee

**M8-5** On December 31, 2006 Kern Company adopted the dollar-value LIFO inventory method. All of Kern's inventories constitute a single pool. The inventory on December 31, 2006 using the dollar-value LIFO inventory method, was \$600,000. Inventory data for 2007 are as follows:

Dec. 31, 2007 inventory at year-end prices	\$780,000
Relevant price index at year-end (base year 2006)	120

Under the dollar-value LIFO inventory method, Kern's inventory method, Kern's inventory on December 31, 2007 would be

- a. \$650,000  
b. \$655,000  
c. \$660,000  
d. \$720,000

**M8-6** Assuming no beginning inventory, what can be said about the trend of inventory prices if cost of goods sold computed when inventory is valued using the FIFO method exceeds cost of goods sold when inventory is valued using the LIFO method?

- a. Prices decreased.  
b. Prices remained unchanged.  
c. Prices increased.  
d. Price trend *cannot* be determined from information given.

**M8-7** Dixon Menswear Shop regularly buys shirts from Colt Company and is allowed trade discounts of 20% and

**E8-4 Inventory Valuation** A retailer of washing machines receives a rebate of \$25 per machine purchased if total purchases exceed 1,000 units. On reviewing the inventory records in December, it discovers that it has purchased 1,100 units during the year. The company claims the rebate immediately but it is not received until January.

**Required**

Prepare journal entries to record the claiming of the rebate and its receipt. What effect do these events have on the inventory valuation on December 31?

**E8-5 Discounts** The Hirsch Company buys inventory for \$20,000 on terms of 2/10, n/30. It pays within the discount period.

**Required**

Prepare the journal entries to record the purchase and the payment under both the (1) gross price and (2) net price methods.

**E8-6 Discounts** The Nelson Company bought inventory for \$50,000 on terms of 2/15, n/60. It pays for the first \$37,500 of inventory purchased within the discount period and pays for the remaining \$12,500 two months later.

**Required**

Prepare the journal entries to record the purchase and the payment under both the (1) gross price and (2) net price methods.

**E8-7 Alternative Inventory Methods** The Nevens Company uses a periodic inventory system. During November the following transactions occurred:

Date	Transaction	Units	Cost/Unit
November 1	Balance	500	\$3.50
8	Sale	350	
13	Purchase	300	4.00
21	Purchase	200	5.00
28	Sale	150	

**Required**

Compute the cost of goods sold for November and the inventory at the end of November for each of the following cost flow assumptions:

1. FIFO
2. LIFO
3. Average cost

**E8-8 Alternative Inventory Methods** The perpetual inventory records of the Park Company indicate the following transactions in the month of June:

	Units	Cost/Unit
Inventory, June 1	200	\$3.20
Purchases		
June 3	200	3.50
June 17	250	3.60
June 24	300	3.65
Sales		
June 6	300	
June 21	200	
June 27	150	

**Required** 

Compute the cost of goods sold for June and the inventory at the end of June, using each of the following cost flow assumptions:

1. FIFO
2. LIFO
3. Average cost (round unit costs to 2 decimal places)

**E8-9 AICPA Adapted Alternative Inventory Methods** The Frate Company was formed on December 1, 2006. The following information is available from Frate's inventory records for Product Ply:

	Units	Unit Cost
January 1, 2007 (beginning inventory)	800	\$ 9.00
Purchases:		
January 6, 2007	1,500	10.00
January 24, 2007	1,200	10.50
February 17, 2007	600	11.00
March 27, 2007	900	11.50

A physical inventory on March 31, 2007 shows 1,600 units on hand.

#### Required

Prepare schedules to compute the ending inventory at March 31, 2007 under each of the following inventory methods:

1. FIFO
2. LIFO
3. Weighted average

Show supporting computations in good form.

**E8-10 LIFO, Perpetual and Periodic** The inventory records of the Riedel Company showed the following transactions for the fiscal period ended June 30:

	Units	Cost/Unit
June 1 Inventory	700	\$6.20
June 3 Purchases	400	6.40
June 15 Sales @ \$12.00	300	
June 22 Sales @ \$12.50	600	
June 30 Purchases	600	6.70

#### Required

Compute the ending inventory and the cost of goods sold under the LIFO cost flow assumption, assuming both a perpetual and a periodic inventory system. Explain any difference in the final inventory valuations.

**E8-11 Dollar-Value LIFO** A company adopted the LIFO method when its inventory was \$1,800. One year later its ending inventory was \$2,100 and costs had increased 5% during the year.

#### Required

What is the ending inventory using dollar-value LIFO?

**E8-12 Dollar-Value LIFO** On January 1, 2006 the Sato Company adopted the dollar-value LIFO method of inventory costing. The company's ending inventory records appear as follows:

Year	Current Cost	Index
2006	\$40,000	100
2007	56,100	120
2008	58,500	130
2009	70,000	140

#### Required

Compute the ending inventory for the years 2006, 2007, 2008, and 2009, using the dollar-value LIFO method (round to the nearest dollar).

**E8-13 AICPA Adapted Dollar-Value LIFO** The Belstock Company manufactures one product. On December 31, 2006 Belstock adopted the dollar-value LIFO inventory method. The inventory on that date, using the dollar-value LIFO inventory method, was \$200,000. Inventory data for succeeding years are as follows:

Year	Inventory at Respective Year-End Prices	Price Index (Base Year 2006)
2007	\$231,000	1.05
2008	299,000	1.15
2009	300,000	1.20

#### Required

Compute the inventory for the following dates using the dollar-value LIFO method for each year:

1. December 31, 2007,
2. December 31, 2008, and
3. December 31, 2009.

**E8-14 AICPA Adapted Dollar-Value LIFO** The Acute Company manufactures a single product. On December 31, 2006 Acute adopted the dollar-value LIFO inventory method. It computes the inventory on that date using the dollar-value LIFO inventory method as \$300,000. Inventory data for succeeding years are as follows:

Year Ended December 31,	Inventory at Respective Year-End Prices	Relevant Price Index (Base Year 2003)
2007	\$363,000	1.10
2008	420,000	1.20
2009	430,000	1.25

#### Required

Compute the inventory amounts at December 31, 2007, 2008, and 2009, using the dollar-value LIFO inventory method for each year.

**E8-15 Inventory Pools** The Stone Shoe Company adopted dollar-value LIFO on January 1, 2007. The company produces four products and uses a single inventory pool. The company's beginning inventory consists of the following:

Type	Quantity	Cost per Unit	Total Cost
Running	80,000	\$16	\$1,280,000
Tennis	30,000	15	450,000
Basketball	60,000	14	840,000
Soccer	<u>40,000</u>	17	<u>680,000</u>
	<u>210,000</u>		<u>\$3,250,000</u>

During 2007, the company has the following purchases and sales:

Type	Quantity Purchased	Cost per Unit	Quantity Sold	Selling Price per Unit
Running	150,000	\$19	140,000	\$40
Tennis	130,000	16	100,000	38
Basketball	100,000	14	90,000	37
Soccer	<u>120,000</u>	18	<u>140,000</u>	42
	<u>500,000</u>		<u>470,000</u>	

#### Required

1. Compute the LIFO cost of the ending inventory. (Round the cost index to 4 decimal places.)
2. By how much would the company's gross profit be different if it had used four pools instead of a single pool?

**E8-16 FIFO Used Internally, LIFO Used Externally** The Grimstad Company uses FIFO for internal reporting purposes and LIFO for financial reporting and income tax purposes. At the end of 2007 the following information was obtained from the inventory records:

	2006	2007
Ending inventory, FIFO	\$100,000	\$140,000
Ending inventory, LIFO	80,000	115,000

**Required**

1. Prepare the necessary adjusting journal entry, assuming that the company converts the accounts to LIFO at the end of 2007.
2. Indicate how the company would disclose the inventory value on its comparative balance sheets prepared at the end of 2007.
3. By how much would the company's cost of goods sold be different in 2007 if it used FIFO for external reporting?

**E8-17 LIFO and Interim Financial Reports** The following values were obtained from the inventory records of the Harris Company, which has a fiscal year ending on December 31:

Inventory, January 1, 2007, LIFO	\$80,000
Inventory, March 31, 2007, LIFO	70,000

**Required**

1. Under what conditions is the company's inventory liquidation not reflected in its first-quarter interim financial statements?
2. Assuming that the liquidation is not to be reflected, what adjusting worksheet entry would the company make and how would you determine the amount?

**E8-18 Exchange Gains and Losses (Appendix)** On January 15, 2007, the Searle Company, a U.S. company, acquired machinery on credit from a British company for £12,000. The company paid for the machine on January 30, 2007. The exchange rates on January 15 and 30 were \$1.85 and \$1.80, respectively.

**Required**

Record the journal entries for the acquisition and payment by the Searle Company.

**E8-19 Exchange Gains and Losses (Appendix)** On June 21, 2007, the Livingston Company, a U.S. company, sold merchandise on credit to a Swiss company for 25,000 francs. The company received payment for the merchandise on July 10, 2007. The exchange rates on June 21 and July 10 were \$0.69 and \$0.68, respectively.

**Required**

Record the journal entries for the sale and collection by the Livingston Company.

## PROBLEMS

**P8-1 Items to Be Included in Inventory** As the auditor of the Hayes Company for the year ended December 31, 2007, you found the following transactions occurred near its closing date:

1. Merchandise received on January 8, 2008, and costing \$800, was recorded on January 6, 2008. An invoice on hand showed the shipment was made FOB supplier's warehouse on December 31, 2007. Since the merchandise was not on hand at December 31, 2007, it was not included in the inventory.
2. A product costing \$600 was in Hayes' shipping room when the physical inventory was taken. It was not included in the inventory because it was marked "Hold for customer's shipping instructions." Investigation revealed that the customer's order was dated December 18, 2007, but that the case was shipped and the customer billed on January 10, 2008.
3. A machine, made to order for a customer, was finished on December 31, 2007. The customer had inspected it and was satisfied with it. The customer was billed in full for \$2,000 on that date. The machine was excluded from inventory although it was shipped on January 2, 2008.
4. Merchandise costing \$800 was received on December 26, 2007, but a purchase was not recorded. The goods were "on consignment from Milliken Company."
5. Merchandise costing \$4,000 was received on January 2, 2008, and the related purchase invoice recorded January 5. The invoice showed that the shipment was made on December 29, 2007, FOB destination.

**Required**

For each situation, state whether the Hayes Company should include the merchandise in its inventory. Give your reason for the decision on each item.

**P8-2 Valuation of Inventory** The inventory on hand at the end of 2007 for the Reddall Company is valued at a cost of \$87,450. The following items were not included in this inventory:

1. Purchased goods in transit, under terms FOB shipping point, invoice price \$3,700, freight costs \$170.
2. Goods out on consignment to Marlman Company, sales price \$2,800, shipping costs of \$210.
3. Goods sold to Grina Co. under terms FOB destination, invoiced for \$1,700, which included \$251 freight charges to deliver the goods. Goods are in transit.

- Goods held on consignment by the Reddall Company at a sales price of \$2,700, which included sales commission of 20% of sales price.
- Purchased goods in transit, shipped FOB destination, invoice price \$2,100 which included freight charges of \$190.

**Required**

Determine the cost of the ending inventory that Reddall should report on its December 31, 2007 balance sheet, assuming that its selling price is 140% of the cost of the inventory.

**P8-3 Cost of Sales** As an accountant for the Lee Company, your supervisor gave you the following calculations of the gross profit for the first quarter:

Alternative	Sales (\$50 per unit)	Cost of Goods Sold	Gross Profit
A	\$500,000	\$200,000	\$300,000
B	500,000	228,000	272,000
C	500,000	213,333	286,667

The three alternative cost flow assumptions are FIFO, Average, and LIFO (the alternatives are not necessarily presented in this sequence). The company uses the periodic inventory system. The computation of the cost of goods sold under each alternative is based on the following data:

	Units	Cost/Unit
Inventory, January 1	12,000	\$20
Purchase, January 10	4,000	21
Purchase, February 15	6,000	22
Purchase, March 10	8,000	23

**Required**

Prepare schedules computing the ending inventory (in units and dollars) and proving the cost of goods sold shown here under each of the three alternatives.

**P8-4 Discounts** On April 11, Edwards Construction Company purchased inventory for \$20,000 on terms of 2/10, n/30. It pays the account balance on April 21.

**Required**

- Prepare the journal entries to record the purchase and payment using each of the following methods: (a) gross price, (b) net price.
- If the company sold half the inventory during April for \$12,000, how much income would it recognize under each method?
- Assume that the invoice was misfiled and, as a result, the company did not pay until April 30. Prepare the journal entries to record the purchase and payment under each of the methods. If the company sold half the inventory during April for \$12,000, how much income would it recognize under each method?

**P8-5 Alternative Inventory Methods** The Garrett Company has the following transactions during the months of April and May:

Date	Transaction	Units	Cost/Unit
April 1	Balance	400	
17	Purchase	200	\$5.50
25	Sale	150	
28	Purchase	100	5.75
May 5	Purchase	250	5.50
18	Sale	300	
22	Sale	50	

The cost of the inventory on April 1 is \$5, \$4, and \$2 per unit, respectively, under the FIFO, average, and LIFO cost flow assumptions.

**Required** 

- Compute the costs of goods sold for each month and the inventories at the end of each month for the following alternatives:
  - FIFO periodic
  - FIFO perpetual
  - LIFO periodic
  - LIFO perpetual
  - Weighted average (round unit costs to 2 decimal places)
  - Moving average (round unit costs to 2 decimal places)
- Reconcile the difference between the LIFO periodic and the LIFO perpetual results.

**P8-6 Alternative Inventory Methods** The Totman Company has the following transactions during the months of January and February:

Date	Transaction	Units	Cost/Unit
January 1	Balance	200	
10	Purchase	50	\$25
22	Sale	40	
28	Purchase	60	\$27
February 4	Purchase	40	\$28
14	Sale	50	
23	Sale	20	

The cost of the inventory at January 1 is \$24, \$23, and \$15 per unit, respectively, under the FIFO, average, and LIFO cost flow assumptions.

**Required**

- Compute the cost of goods sold for each month and the inventories at the end of each month for the following alternatives:
  - FIFO periodic
  - FIFO perpetual
  - LIFO periodic
  - LIFO perpetual
  - Weighted average (round unit costs to 2 decimal places)
  - Moving average (round unit costs to 2 decimal places)
- Reconcile the difference between the LIFO periodic and the LIFO perpetual results.
- If the company had purchased an additional 25 units for \$30 each on February 27, compute the cost of goods sold for February under FIFO periodic and LIFO periodic.
- For February, compute the company's inventory turnover under the FIFO and LIFO periodic methods. Use ending inventory instead of average inventory for convenience. Which measure would you use in your evaluation of the company? How would you convert a monthly inventory turnover into an annual measure to use for comparison with other companies? What assumptions are involved?

**P8-7 Alternative Inventory Methods** The Habicht Company was formed in 2006 to produce a single product. The production and sales for the next four years were as follows:

	Production		Sales		Units in Ending Inventory
	Units	Total Costs	Units	Sales Revenue	
2006	100,000	\$200,000	80,000	\$400,000	20,000
2007	120,000	234,000	110,000	550,000	30,000
2008	130,000	247,000	150,000	750,000	10,000
2009	130,000	240,500	120,000	600,000	20,000

**Required**

- Determine the gross profit for each year under each of the following periodic inventory methods:
  - FIFO
  - LIFO
  - Average cost (round unit costs to 3 decimal places)
- Explain whether the company's return on assets (net income divided by average total assets, as we discussed in Chapter 6) would be higher under FIFO or LIFO.

**P8-8 AICPA Adapted LIFO and Inventory Pools** On January 1, 2004 Grover Company changed its inventory cost flow method to the LIFO cost method from the FIFO cost method for its raw materials inventory. It made the change for both financial statement and income tax reporting purposes. Grover uses the multiple-pools approach, under which it groups substantially identical raw materials into LIFO inventory pools; it uses weighted average costs in valuing annual incremental layers. The composition of the December 31, 2006 inventory for the Class F inventory pool is as follows:

	Units	Weighted Average Unit Cost	Total Cost
Base year inventory—2004	9,000	\$10.00	\$ 90,000
Incremental layer—2005	3,000	11.00	33,000
Incremental layer—2006	<u>2,000</u>	12.50	<u>25,000</u>
Inventory, December 31, 2006	<u>14,000</u>		<u>\$148,000</u>

Inventory transactions for the Class F inventory pool during 2007 were as follows:

- On March 2, 2007, 4,800 units were purchased at a unit cost of \$13.50 for \$64,800.
- On September 1, 2007, 7,200 units were purchased at a unit cost of \$14.00 for \$100,800.
- A total of 15,000 units were used for production during 2007.

The following transactions for the Class F inventory pool took place during 2008:

- On January 11, 2008, 7,500 units were purchased at a unit cost of \$14.50 for \$108,750.
- On May 14, 2008, 5,500 units were purchased at a unit cost of \$15.50 for \$85,250.
- On December 29, 2008, 7,000 units were purchased at a unit cost of \$16.00 for \$112,000.
- A total of 16,000 units were used for production during 2008.

**Required**

- Prepare a schedule to compute the inventory (units and dollar amounts) of the Class F inventory pool at December 31, 2007. Show supporting computations in good form.
- Prepare a schedule to compute the cost of Class F raw materials used in production for the year ended December 31, 2007.
- Prepare a schedule to compute the inventory (units and dollar amounts) of the Class F inventory pool at December 31, 2008. Show supporting computations in good form.

**P8-9 Dollar-Value LIFO** The Olson Company adopted the dollar-value LIFO method for inventory valuation at the beginning of 2006. The following information about the inventory at the end of each year is available from the company records:

Year	Current Costs	Index
2005	\$50,000	100
2006	60,000	108
2007	70,000	115
2008	73,000	125
2009	78,000	135

**Required**

- Calculate the dollar-value LIFO inventory at the end of each year.
- Prepare the appropriate disclosures for the year 2009 annual report if the company uses current cost internally and LIFO for financial reporting. Why would the company use current cost internally?

**P8-10 Dollar-Value LIFO** The Kwestel Company adopted the dollar-value LIFO method for inventory valuation at the beginning of 2006. The following information about the inventory at the end of each year is available from the company records:

Year	Current Cost	Index
2005	\$ 8,000	100
2006	10,800	120
2007	11,500	130
2008	14,000	145
2009	10,500	125

**Required** 

Calculate the dollar-value LIFO inventory at the end of each year.

**P8-11 Dollar-Value LIFO and Inventory Pools** The Webster Company adopted dollar-value LIFO on January 1, 2007. The company produces three products: X, Y, and Z. The company's beginning inventory consisted of the following:

Type	Quantity	Cost per Unit	Total Cost
X	30,000	\$4.25	\$127,500
Y	10,000	3.50	35,000
Z	<u>25,000</u>	2.00	<u>50,000</u>
	<u>65,000</u>		<u>\$212,500</u>

During 2007, the company had the following purchases and sales:

Type	Quantity Purchased	Cost per Unit	Quantity Sold	Selling Price per Unit
X	110,000	\$4.75	90,000	\$10.00
Y	100,000	3.75	85,000	7.50
Z	<u>75,000</u>	2.10	<u>70,000</u>	5.00
	<u>285,000</u>		<u>245,000</u>	

**Required**

1. Compute the LIFO cost of the ending inventory assuming Webster Company uses a single inventory pool. (Round cost index to 4 decimal places.)
2. Compute the LIFO cost of the ending inventory assuming Webster Company uses three inventory pools. (Round cost indexes to 4 decimal places.)

**P8-12 Comprehensive** The Kelly Company adopted dollar-value LIFO on January 1, 2006 using two inventory pools, each of which includes two types of inventory items. The following information about the inventory at the end of each year is available:

Year	Pool 1			Pool 2		
	Number of Units	Type	Average Cost per Unit	Number of Units	Type	Average Cost per Unit
2006	20,000	A	\$10	40,000	C	\$5
	10,000	B	20	20,000	D	8
2007	30,000	A	11	50,000	C	7
	12,000	B	24	22,000	D	9
2008	40,000	A	12	46,000	C	6
	14,000	B	22	20,000	D	8
2009	45,000	A	12	60,000	C	7
	13,000	B	25	25,000	D	8

**Required**

1. Compute the cost index for each year for each pool using a base of 100 for each index. (Round each cost index to 4 decimal places.)
2. Compute the dollar-value LIFO inventory at the end of each year.

**P8-13 AICPA Adapted Double-Extension: Dollar-Value LIFO** On January 1, 2007 Lucas Distributors, Inc., adopted the dollar-value LIFO inventory method for income tax and external financial reporting. However, Lucas continued to use the FIFO inventory method for internal accounting and management purposes. In applying the LIFO method, Lucas uses internal conversion cost indexes and the multiple-pools approach under which substantially identical inventory items are grouped into LIFO inventory pools. The following data were available for Inventory Pool No. 1, which is comprised of products A and B, for the 2 years following the adoption of LIFO:

	FIFO Basis per Records		
	Units	Unit Cost	Total Cost
Inventory, 1/1/07			
Product A	12,000	\$30	\$360,000
Product B	8,000	25	<u>200,000</u>
			<u>\$560,000</u>
Inventory, 12/31/07			
Product A	17,000	\$35	\$595,000
Product B	9,000	28	<u>252,000</u>
			<u>\$847,000</u>
Inventory, 12/31/08			
Product A	13,000	\$40	\$520,000
Product B	10,000	32	<u>320,000</u>
			<u>\$840,000</u>

**Required**

1. Prepare a schedule to compute the internal conversion cost indexes for 2007 and 2008. Round indexes to two decimal places.
2. Prepare a schedule to compute the inventory amounts at December 31, 2007 and 2008, using the dollar-value LIFO inventory method.

**P8-14 LIFO Liquidation Profit** The Hammond Company adopted LIFO when it was formed on January 1, 2005. Since then, the company has had the following purchases and sales of its single inventory item:

Year	Units Purchased	Cost per Unit	Units Sold	Price per Unit
2005	10,000	\$5	8,000	\$12
2006	12,000	6	9,000	13
2007	15,000	8	14,000	16

In December 2008, the controller realized that because of an unexpected increase in demand, the company had sold 22,000 units but had purchased only 19,000 units during the year. In 2008, each unit had been sold for \$19, and each unit purchased had cost \$10. The income tax rate is 30%.

**Required**

1. If the company makes no additional purchases in 2008, how much LIFO liquidation profit will it report?
2. Prepare the appropriate annual report disclosures for 2008.
3. If the company purchases an additional 7,000 units in December 2008, how much income tax will the company save?
4. If the company purchases the additional 7,000 units, how much income tax has the company saved over the four-year period by using LIFO instead of the FIFO cost flow assumption?

**P8-15 Comprehensive** The following information for 2007 is available for the Marino Company:

1. The beginning inventory is \$100,000.
2. Purchases of \$300,000 were made on terms of 2/10, n/30. Eighty percent of the discounts were taken.
3. Purchases returns of \$4,000 were made.
4. At December 31, purchases of \$20,000 were in transit, FOB destination, on terms of 2/10, n/30.
5. The company made sales of \$640,000. The gross selling price per unit is twice the net cost of each unit sold.
6. Sales allowances of \$6,000 were made.
7. The company uses the LIFO periodic method and the gross method for purchases discounts.

**Required**

1. Compute the cost of the ending inventory before the physical inventory is taken.
2. Compute the amount of the cost of goods sold that came from the purchases of the period and the amount that came from the beginning inventory.

**P8-16 AICPA Adapted Inventory Valuation** You are engaged in an audit of the Roche Mfg. Company for the year ended December 31, 2007. To reduce the workload at year-end, the company took its annual physical inventory under your observation on November 30, 2007. The company's inventory account, which includes raw materials and work in process, is on a perpetual basis and it uses the first-in, first-out method of pricing. It has no finished goods inventory. The company's physical inventory revealed that the book inventory of \$60,570 was understated by \$3,000. To avoid distorting the interim financial statements, the company decided not to adjust the book inventory until year-end except for obsolete inventory items. Your audit revealed this information about the November 30 inventory:

- a. Pricing tests showed that the physical inventory was overpriced by \$2,200.
- b. Footing and extension errors resulted in a \$150 understatement of the physical inventory.
- c. Direct labor included in the physical inventory amounted to \$10,000. Overhead was included at the rate of 200% of direct labor. You determined that the amount of direct labor was correct and the overhead rate was proper.
- d. The physical inventory included obsolete materials recorded at \$250. During December, these materials were removed from the inventory account by a charge to cost of sales. Your audit also disclosed the following information about the December 31, 2007 inventory.
- e. Total debits to certain accounts during December are:

	<u>December</u>
Purchases	\$24,700
Direct labor	12,100
Manufacturing overhead expense	25,200
Cost of sales	68,600

- f. The cost of sales of \$68,600 included direct labor of \$13,800.
- g. Normal scrap loss on established product lines is negligible. However, a special order started and completed during December had excessive scrap loss of \$800, which was charged to Manufacturing Overhead Expense.

**Required**

1. Compute the correct amount of the physical inventory at November 30, 2007.
2. Without prejudice to your solution to Requirement 1, assume that the correct amount of the inventory at November 30, 2007 was \$57,700. Compute the amount of the inventory at December 31, 2007.

**P8-17 AICPA Adapted Comprehensive** The Allen Company is a wholesale distributor of automotive replacement parts. Initial amounts taken from Allen's accounting records are as follows:

Inventory at December 31, 2007 (based on physical count of goods in Allen's warehouse on December 31, 2007)	<u>\$1,250,000</u>
Sales in 2007	<u>\$9,000,000</u>

Accounts payable at December 31, 2007:

<u>Vendor</u>	<u>Terms</u>	<u>Amount</u>
Baker Company	2% 10 days, net 30	\$ 265,000
Charlie Company	Net 30	210,000
Dolly Company	Net 30	300,000
Eager Company	Net 30	225,000
Full Company	Net 30	—
Greg Company	Net 30	—
		<u>\$1,000,000</u>

Additional information is as follows:

1. Parts held on consignment from Charlie to Allen, the consignee, amounting to \$155,000, were included in the physical count of goods in Allen's warehouse on December 31, 2007 and in accounts payable at December 31, 2007.
2. \$22,000 of parts, which were purchased from Full and paid for in December 2007 were sold in the last week of 2007 and appropriately recorded as sales of \$28,000. The parts were included in the physical count of goods in Allen's warehouse on December 31, 2007 because the parts were on the loading dock waiting to be picked up by customers.

3. Parts in transit on December 31, 2007 to customers, shipped FOB shipping point on December 28, 2007, amounted to \$34,000. The customers received the parts on January 7, 2008. Sales of \$40,000 to the customers for the parts were recorded by Allen on January 3, 2008.
4. Retailers were holding \$210,000 at cost (\$250,000 at retail) of goods on consignment from Allen, the consignor, at their stores on December 31, 2007.
5. Goods were in transit from Greg to Allen on December 31, 2007. The cost of the goods was \$25,000, and they were shipped FOB shipping point on December 29, 2007.
6. A quarterly freight bill in the amount of \$2,000 specifically relating to merchandise purchases in December 2007, all of which was still in the inventory at December 31, 2007, was received on January 4, 2008. The freight bill was not included in either the inventory or in accounts payable at December 31, 2007.
7. All of the purchases from Baker occurred during the last seven days of the year. These items have been recorded in accounts payable and accounted for in the physical inventory at cost before discount. Allen's policy is to pay invoices in time to take advantage of all cash discounts, adjust inventory accordingly, and record accounts payable, net of cash discounts.

#### Required

Prepare a schedule of adjustments to the initial amounts of inventory, accounts payable, and sales. Show the effect, if any, of each of the transactions separately and indicate if the transactions would have no effect on the amount.

## CASES

### COMMUNICATION

#### C8-1 Dollar-Value LIFO

**AICPA Adapted** In January Broome, Inc., requested and secured permission from the Commissioner of Internal Revenue to compute inventories under the last-in, first-out (LIFO) method and elected to determine inventory cost under the dollar-value method. Broome, Inc., satisfied the Commissioner that cost could be accurately determined by use of an index number computed from a representative sample selected from the Company's single inventory pool.

#### Required

1. Why should a company include inventories in (a) its statement of financial position and (b) the computation of its net income?
2. The Internal Revenue Code allows some accountable events to be considered differently for income tax reporting purposes and financial accounting purposes, while other accountable events must be reported the same for both purposes. Discuss why it might be desirable to report some accountable events differently for financial accounting purposes than for income tax reporting purposes.
3. Discuss the ways and conditions under which the FIFO and LIFO inventory costing methods produce different inventory valuations. Do not discuss procedures for computing inventory cost.

4. Discuss the specific advantages and disadvantages of using the dollar-value LIFO application as compared to traditional LIFO methods. Ignore income tax considerations.

#### C8-2 FIFO and LIFO

**AICPA Adapted** *Part a.* A company may compute inventory under one of various cost flow assumptions. Among these assumptions are first-in, first-out (FIFO) and last-in, first-out (LIFO). In the past, some companies have changed from FIFO to LIFO for computing portions or all of their inventory.

#### Required

1. Ignoring income tax, explain what effects a change from FIFO to LIFO has on a company's net earnings and working capital.
2. Explain the difference between the FIFO assumption of earnings and operating cycle and the LIFO assumption of earnings and operating cycle.

*Part b.* A company using LIFO inventory may establish a "Reserve for the Replacement of LIFO Inventory" account.

#### Required

Explain why and how a company establishes this "reserve" account and where it should show the account on its statement of financial position.

### C8-3 Cash Discounts, FIFO, and LIFO

**AICPA Adapted** Taylor Company, a household appliances dealer, purchases its inventories from various suppliers. Taylor has consistently stated its inventories at the lower of cost (FIFO) or market.

#### Required

- Taylor is considering alternate methods of accounting for the cash discounts it takes when paying its suppliers promptly. From a theoretical standpoint, discuss the acceptability of each of the following methods:
  - Financial income when payments are made.
  - Reduction of cost of goods sold for period when payments are made.
  - Direct reduction of purchase cost.
- Identify the effects on both the balance sheet and the income statement of a company using the LIFO inventory method instead of the FIFO method over a substantial time period when purchase prices of household appliances are rising. State why these effects take place.

### C8-4 Specific Identification

**AICPA Adapted** Happlia Co. imports expensive household appliances. Each model has many variations and

each unit has an identification number. Happlia pays all costs for getting the goods from the port to its central warehouse in Des Moines. After repackaging, the goods are consigned to retailers. A retailer makes a sale, simultaneously buys the appliance from Happlia, and pays the balance due within one week.

To alleviate the overstocking of refrigerators at a Minneapolis retailer, some were reshipped to a Kansas City retailer where they were still held in inventory at December 31, 2007. Happlia paid the costs of this reshipment.

Happlia uses the specific identification inventory costing method.

#### Required

- In regard to the specific identification inventory costing method
  - Describe its key elements.
  - Discuss why it is appropriate for Happlia to use this method.
- What general criteria should Happlia use to determine inventory carrying amounts at December 31, 2007? Ignore lower of cost or market considerations.
  - Give four examples of costs included in these inventory carrying amounts.
- What costs should be reported in Happlia's 2007 income statement? Ignore lower of cost or market considerations.

## CREATIVE AND CRITICAL THINKING

### C8-5 Cash Discounts

**AICPA Adapted** The Atgar Corporation records all purchases and the corresponding liabilities net of cash discounts. Whenever it pays after the discount period, it credits cash for the full amount of the invoice, and debits accounts payable for the net amount and an expense account for the discount lost.

#### Required

Explain the arguments for and against this treatment of cash discounts.

### C8-6 Purchases Discounts

The Auge Company annually purchases 1,000 tons of raw material at a cost of \$100,000 with terms of 2/10, n/30. Freight costs amount to \$10,000 and storage and handling costs to \$7,500.

#### Required

- What is the correct inventory cost?
- Explain whether your answer to Requirement 1 would change if the discount were not taken.
- Would your answer to Requirement 1 change if the storage and handling costs were fixed costs and therefore not dependent on the volume of material stored?

### C8-7 Cost Flow Assumptions

**AICPA Adapted** A company should determine cost for inventory purposes by the inventory cost flow method most clearly reflecting its periodic income.

#### Required

- Explain the fundamental cost flow assumptions of the average cost, FIFO, and LIFO inventory cost flow methods.
- Discuss the reasons a company uses LIFO in an inflationary economy.
- Where there is evidence that the utility of goods, in their disposal in the ordinary course of business, will be less than cost, explain the proper accounting treatment and under what concept that treatment is justified.

### C8-8 LIFO

The 1970s were a period of historically high inflation. The 1976 financial statements of the Ford Motor Company included the following note:

*Note 1 (in part):* Inventory valuation. Inventories are stated at the lower of cost or market. In 1976 the company changed its method of accounting from first-in, first-out (FIFO) to last-in, first-out (LIFO) for most of its U.S. inventories.

The change to LIFO reduced net income in 1976 by \$81 million or \$0.86 a share. There is no effect on prior years'

earnings resulting from the change to LIFO in 1976 and, accordingly, prior years' earnings have not been restated. If the FIFO method of inventory accounting had been used by the company, inventories on December 31, 1976, would have been \$166 million higher than reported.

#### Required

1. Explain the arguments that must have been used in favor of LIFO for the management of Ford to accept a reduction in net income of \$81 million.
2. Explain the disadvantages that are likely to result from the adoption of LIFO.
3. Explain why the effect on earnings is \$81 million when the effect on the inventory valuation is \$166 million.
4. Explain whether your answers to Requirements 1 and 2 would change if you were discussing a change to LIFO for a Ford dealer.

### C8-9 Selection of an Inventory Method and Ethical Issues

The Kelly Company uses FIFO. It has experienced rising costs for the last 5 years and expects that trend to continue. The King Company increased the number of LIFO pools it uses to account for its inventory.

#### Required

1. Explain why you think each company follows its policy.
2. Does either practice create ethical issues?

### C8-10 Interpretation of GAAP and Ethical Issues

Robin Smith is considering buying shares in the Mah Company. The company has reported an increase in net income this year. On careful reading of the notes to the financial statements, Robin learns that the company had a LIFO liquidation this year. Robin understands what caused the liquidation but has asked you for advice about how to interpret it.

#### Required

1. Prepare a short memo to Robin to answer the question.
2. Could a LIFO liquidation profit create ethical issues?

### C8-11 Exchange Rates (Appendix)

The Gasper Company has transactions with companies in many countries. It purchases components from companies

in Korea and several European countries and sells its products throughout the world. The CEO is concerned that the stock market does not like companies to have volatile earnings. However, she is more willing to accept volatility if earnings are higher than they otherwise would be.

#### Required

Select a type of business with which you are familiar and that would be appropriate for Gasper Company's international activities. Write a memo to the CEO outlining how to eliminate her concerns.

### C8-12 Analyzing Coca-Cola's Inventory Disclosures

Refer to the financial statements and related notes of the Coca-Cola Company in Appendix A of this book.

#### Required

1. Which inventory method(s) does the company use? Explain why you think the company selected this method(s).
2. Compute the inventory turnover ratio for 2004 and 2003 using the ending inventory instead of the average inventory. What is your evaluation of the difference?
3. Recreate summary journal entries to record the transactions that affected inventory during 2004.

### C8-13 Ethics and Free Textbooks

Textbook publishers provide a copy of a particular book to each professor who is making a decision about adopting a book for the class. These books may be solicited by the professor or may be unsolicited. Some of the books are stamped "For Faculty Use Only." "Used book" companies send out reps who are reimbursed for their travel expenses and are paid a commission to buy these books from the professors at a low price. A lot of these books are purchased at the end of spring, held as inventory over the summer, and sold to university bookstores before the beginning of fall classes. The bookstores sell them to students or return them. Depending on the condition of the book, it is sold to students as either "new" or "used."

#### Required

From financial reporting and ethical perspectives, discuss the issues raised by the above situation.

## RESEARCH SIMULATIONS

### R8-1 Researching GAAP

#### Situation

To pump up sales of all brands, Philip Morris is moving aggressively to ship extra cases of cigarettes into distributors' warehouses and record them as sales, a practice generally known as "trade loading." (Adapted from *Fortune*, April 6,

1992). Philip Morris' president has asked you whether these shipments may be recognized as revenue.

#### Directions

Research the related generally accepted accounting principles and prepare a short memo to the president. Cite your references and applicable paragraph numbers.

## R8-2 Researching GAAP

### Situation

The Fenimore Manufacturing Company uses the average cost method. It has followed a policy of expensing all its manufacturing cost variances. It is considering a change in its policy that will involve allocating them between cost of goods

sold and inventory. Fenimore's president has asked you which of these alternative policies is consistent with GAAP.

### Directions

Research the related generally accepted accounting principles and prepare a short memo to the president. Cite your references and applicable paragraph numbers.

## 9

## OBJECTIVES

After reading this chapter, you will be able to:

- 1 Understand the lower of cost or market method.
- 2 Explain the conceptual issues regarding the lower of cost or market method.
- 3 Understand purchase obligations and product financing arrangements.
- 4 Explain the valuation of inventory above cost.
- 5 Use the gross profit method.
- 6 Understand the retail inventory method.
- 7 Explain the conceptual issues regarding the retail inventory method.
- 8 Understand the dollar-value LIFO retail method.
- 9 Understand the effects of inventory errors on the financial statements.

## Inventories: Special Valuation Issues

### Relationships That Matter

Inventory is a major asset of many companies, and the measurement of inventory involves management decisions that have a major impact on both the balance sheet and the income statement. Accordingly, financial statement users will pay close attention to inventory changes as they assess the financial health of companies. Typically, increases in raw materials and work-in-process inventories signal increases in production to meet higher anticipated future demand. Increases in finished goods inventory, on the other hand, typically indicate lower demand.

Perceptive users need to understand some special valuation issues related to inventory so that they can more clearly understand inventory's impact on the financial statements. For example, assuming that costs and selling prices move together, a decrease in the cost of inventory may signal a future decline in selling price and usefulness of inventory. Following the principle of conservatism, companies employ a lower of cost or market rule so that they will report inventory losses as soon as they discover them. Other companies, with large amounts of inventory, may

Credit: Comstock Images

find it either impractical to conduct physical inventory counts to prepare interim reports or inefficient to maintain records of individual inventory purchases. Recognizing the relationship between the costs of inventory purchases and selling prices, a company may be able to more efficiently manage its inventory using estimation techniques such as the retail inventory method. In any event, an understanding of key relationships between inventory and other financial and economic phenomena is essential for effective inventory management and control.

### FOR FURTHER INVESTIGATION

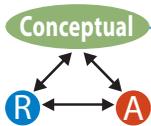

For a discussion of the relationship between inventory and the business cycle, consult the Business & Company Resource Center (BCRC):

- Inventories and the Business Cycle: An Overview. Terry J. Fitzgerald, *Economic Review (Cleveland)*, 0013-0281, Summer 1997, v33, n3, p11.

In Chapter 8 we described the various methods to determine the historical cost of inventory. In certain situations a company does not report its inventory at the historical cost. The alternatives to historical cost are valuation at the lower of cost or market, valuation above cost, and estimation of cost by the gross profit or retail inventory methods, including the dollar-value LIFO retail inventory method. We discuss each of these topics in this chapter, as well as purchase obligations, product financing arrangements, and the effects of errors in inventory on a company's financial statements.

## LOWER OF COST OR MARKET

1 Understand the lower of cost or market method.

Valuation of inventory at historical cost, based on the cost flow assumption used, is modified when the market value of a company's inventory has declined below its historical cost. This might occur for reasons such as declining costs, obsolescence, or physical deterioration. In these situations the lower of cost or market rule is applied. **The lower of cost or market rule requires that a company write down its inventory to its market value when the inventory's utility has declined.** The write-down of the inventory is appropriate because the utility of the asset has declined. Also, to leave the inventory at its historical cost would overstate both its value and the expected future cash inflows. The lower of cost or market rule is consistent with the conservatism principle. Since the company writes down the asset, it reports a loss (or expense) in its income statement because the decline is an economic event of the period.<sup>1</sup>

Since utility is difficult to measure except through a changed market value, the measurement of the decline in utility is, in practice, always made by valuing the inventory at the lower of cost or market (LCM). **Market value is the current replacement cost** (either by purchase or manufacture) and *not* the selling price.

### Application of Lower of Cost or Market Method

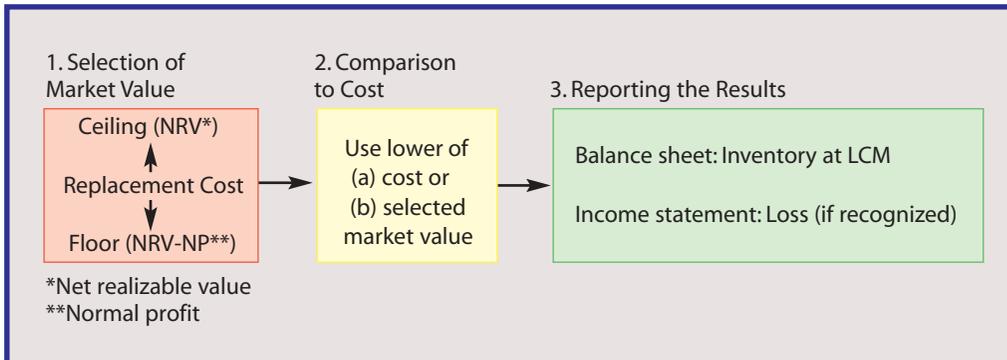

When a company applies the lower of cost or market method, it compares the cost to the market value. It does not always use the current replacement cost as the market value, however. An upper (*ceiling*) and a lower (*floor*) constraint on the market value are imposed as follows:

1. **The upper constraint is that the market value should not exceed the net realizable value** (the estimated selling price in the ordinary course of business, less reasonably predictable costs of completion and disposal).
2. **The lower constraint is that the market value should not be below the net realizable value, reduced by an allowance for a normal profit margin** (normal markup).

These two constraints are used to determine which "market value" (current replacement cost, ceiling, or floor) is to be compared to cost. Note that the appropriate market value is determined before the comparison with the cost is made. **The purpose of the ceiling is to ensure that the write-down of the inventory is enough to cover all expected losses and therefore prevent the recognition of further losses in the future.** In contrast, **the purpose of the floor is to prevent an excessive loss from being recognized and therefore prevent the recognition of excessive profits in the future** (as we discuss later in this section).

1. "Restatement and Revision of Accounting Research Bulletins," *Accounting Research Bulletins, Final Edition*, No. 43 (New York: AICPA, 1961), ch. 4, par. 7.

Thus, to apply the lower of cost or market (LCM) method a company completes three steps: it (1) selects the market value, (2) compares the market value to cost, and (3) reports the results in its financial statements, as we show in the following diagram:

In the first step, the company calculates the current replacement cost, ceiling, and floor. It selects the middle value of the three. Then, it chooses the lower of the selected market value or the historical cost. Finally, the company reports the lower value on its balance sheet and, if it recognizes a loss, it reports the amount on the income statement, perhaps including it in cost of goods sold.

To illustrate the first step in the application of the lower of cost or market method, suppose that a company's unit of inventory has the following characteristics:

Selling price	\$165
Packaging cost	10
Transportation cost	15
Profit margin	40

The company computes the ceiling and floor as follows:

Selling price	\$165
Less: Costs of completion (i.e., packaging)	(10)
Costs of disposal (i.e., transportation)	(15)
Ceiling (net realizable value)	<u>\$140</u>
Less: Normal profit margin	(40)
Floor (net realizable value less normal profit)	<u>\$100</u>

If the current replacement cost is between \$100 and \$140, it would be used as the market value. If the replacement cost is above \$140, the ceiling would be used; if the replacement cost is below \$100, the floor would be used.

We show all three steps in applying the lower of cost or market method in Example 9-1 for a single unit of inventory. We use Cases 5 and 6 to explain the logic behind the ceiling and floor. If in Case 5 the ceiling constraint was ignored and the current replacement cost was used as market, the inventory would be written down only to \$105 and a loss of \$5 would be recognized. However, in a later period when the unit is sold for \$90 (net), there would be an additional loss of \$15. Therefore, the inventory would not have been written down to its expected utility, and the total loss due to the decline in utility would not have been recognized in the period in which it occurred. Imposing an upper limit of net realizable value ensures that the full decline in utility is recognized in the period in which it occurred. At first it might be considered unusual that the net realizable value is below the replacement cost (of a new asset), but this can happen when there is physical deterioration to the inventory. If the volume of such items becomes significant, they should be transferred to a separate account.

If the floor constraint was ignored in Case 6 and the current replacement cost was used as market, the inventory would be written down to \$80 and a loss of \$30 would be recognized. However, in a later period when the unit is sold for \$140 (net), there would

**EXAMPLE 9-1 Application of the Lower of Cost or Market Rule**

Case	Current Replacement Cost	Net Realizable Value (Ceiling)	Net Realizable Value Less a Normal Markup (Floor)	Market (Constrained by Ceiling and Floor)	Cost	Lower of Cost or Market Inventory Value*	Loss
1	\$120	\$140	\$100	\$120	\$110	\$110	\$ 0
2	150	140	100	140	110	110	0
3	75	140	120	120	110	110	0
4	105	140	100	105	110	105	5
5	105	90	80	90	110	90	20
6	80	140	100	100	110	100	10

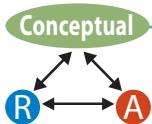

\*Cases 1, 2 and 3: Cost is used because it is lower than market.

Case 4: Replacement cost is used because it is between floor and ceiling and is less than cost.

Case 5: Net realizable value (ceiling) is used because replacement cost is higher than ceiling and net realizable value is less than cost.

Case 6: Net realizable value less a normal markup (floor) is used because replacement cost is less than floor and net realizable value less a normal markup is less than cost.

be a profit of \$60, which is higher than the normal profit of \$40. Therefore, the inventory would have been written down below its expected utility, and an excessive loss followed by an excessive profit would have been recognized. Imposing a lower limit of net realizable value less normal profit prevents a write-down below the expected utility of the inventory and the arbitrary transfer of profit from one accounting period to another.

**Conceptual Evaluation of the Ceiling and Floor**

The implicit assumption for the lower of cost or market method is that selling (exit) prices move in parallel to replacement costs (entry prices) within the constraints of the ceiling and floor. While the two prices are likely to move together, there will be exceptions. Also, the lower of cost or market method may be criticized because it uses three different concepts for the loss recognized in the period. This loss recognition also affects the amount of profit a company will recognize in future periods. These differences create conceptual inconsistencies both within the lower of cost or market method and between that method and other conservative methods.

To illustrate these issues, assume the following facts for 1 unit of inventory of the Sahara Company, a retailer:

Cost: \$19  
 Ceiling: 14 (Net realizable value)  
 Floor: 10 (Net realizable value – Normal profit)

**Situation 1**

If we also assume that the replacement cost is \$15, the ceiling of \$14 is used as the market value. Why would the Sahara Company sell an item for \$14 when the replacement cost is \$15? One explanation would be that the supplier of the inventory has set a lower price on a new product so that the inventory held by the Sahara Company has become obsolete.

The loss in the period of the *write-down* is equal to the net realizable value (ceiling) less the historical cost. The expected profit in the period of *sale* is equal to the net realizable value less the ceiling (the new carrying value of the inventory). The loss and expected profit are:

$$\begin{aligned} \text{Loss in period of write-down} &= \$14 - \$19 \\ &= \underline{\underline{\$(5)}} \end{aligned}$$

$$\begin{aligned} \text{Expected profit in period of sale} &= \$14 - \$14 \\ &= \underline{\underline{\$ 0}} \end{aligned}$$

The loss of \$5 is a measure of the expected loss that *would* have been recognized at the time of sale if the lower of cost or market rule had *not* been used. The loss is recognized in the current period instead of in a future period and, therefore, the expected profit at the time of the sale is zero. This loss concept is the same as that applied in other areas where the conservatism principle is used (such as contingencies and construction contracts, which we discuss in Chapters 13 and 18, respectively) because no provision is made for the recognition of a profit when the sale occurs in a future period.

### Situation 2

Assume now that the replacement cost is \$12. In this situation the replacement cost is used as the market value. Why would the Sahara Company sell an item for \$14 when the replacement cost is \$12 and its normal profit (the difference between the ceiling and floor) is \$4? One explanation would be that the supplier has reduced its price on the product, so that the Sahara Company has to reduce its selling price to remain competitive with other retailers who have reduced their prices.

The loss in the period of the *write-down* is equal to the replacement cost less the historical cost. The expected profit in the period of *sale* is the net realizable value less the replacement cost (the new carrying value of the inventory). The loss and expected profit are:

$$\begin{aligned}\text{Loss in period of write-down} &= \$12 - \$19 \\ &= \underline{\underline{\$(7)}} \\ \text{Expected profit in period of sale} &= \$14 - \$12 \\ &= \underline{\underline{\$ 2}}\end{aligned}$$

The loss of \$7 is the cost saving that was missed because the inventory was purchased before the price decline. This alternative allows the company to recognize a profit of \$2 at the time of sale, although it is less than the normal profit of \$4.

### Situation 3

Assume now that the replacement cost is \$9. In this situation the floor of \$10 is used as the market value. Why would the Sahara Company be able to sell an item for \$14 when the replacement cost is \$9 and its normal profit is \$4? One explanation would be that the supplier has reduced the price on the product and has so stimulated demand that the retail price has not fallen as much.

The loss in the period of the *write-down* is equal to the floor (net receivable value minus the normal profit) less the historical cost. The expected profit in the period of *sale* is equal to the net realizable value less the floor (the new carrying value of the inventory). The loss and expected profit are:

$$\begin{aligned}\text{Loss in period of write-down} &= \$10 - \$19 \\ &= \underline{\underline{\$(9)}} \\ \text{Expected profit in period of sale} &= \$14 - \$10 \\ &= \underline{\underline{\$ 4}}\end{aligned}$$

The loss of \$9 is the amount needed to provide a normal profit in the future. The expected profit at the time of sale is the normal profit of \$4.

The loss concept in Situations 2 and 3 is *not* consistent with the conservatism principle applied in other situations because it allows a company to recognize profits in future periods when the sale is made. Note also that the total loss in all three situations is \$5 [ $\$(5) + \$0$ ;  $\$(7) + \$2$ ;  $\$(9) + \$4$ ]. The issue is the inconsistent application of accounting principles, which results in different amounts of loss and profit that a company may recognize in the period of write-down and the period of sale.<sup>2</sup>

2. For additional discussion of these issues, see S.E. Warner and F.D. Whitehurst, "An Illustration of Inventory Loss Measurements Under the LCM Rule," *The Accounting Educators' Journal* (Fall 1988), pp. 32-7.

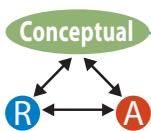

### Approaches to Implementing Lower of Cost or Market Rule

A company may apply the lower of cost or market rule to each item or to the total of the inventory (or, in some cases, to the total of the components of each major category). The method used should clearly reflect periodic income.<sup>3</sup>

Applying the rule to each individual item in inventory results in an inventory value less than (or equal to) the values obtained by the other two alternatives. Under these other two alternatives the price declines of some of the units in inventory are offset by price rises in other items. You can see this in Example 9-2, which illustrates the three alternative methods of implementing the lower of cost or market rule for a company in the first year of its operations. To simplify the example, we assume that there was no beginning inventory. Similar results would be obtained if the cost of the beginning inventory was less than or equal to the market value. If the company applies the lower of cost or market rule to individual items, the inventory value is \$6,100 and it recognizes a loss of \$600 (\$6,100 market – \$6,700 cost). This method is the most conservative alternative. If the company applies the rule to each category, the inventory value is \$6,500 and it recognizes a loss of \$200. If the company applies the rule to the total inventory, the value is \$6,600 and it recognizes a loss of \$100.

#### EXAMPLE 9-2 Approaches to Implementing Lower of Cost or Market

Inventory	Cost	Market	LCM applied to:		
			Individual Items	Inventory Categories	Total Inventory
Category A:					
Item 1	\$1,000	\$ 700	\$ 700		
Item 2	1,200	1,300	1,200		
	<u>\$2,200</u>	<u>\$2,000</u>		\$2,000	
Category B:					
Item 3	\$2,000	\$2,400	2,000		
Item 4	2,500	2,200	2,200		
	<u>\$4,500</u>	<u>\$4,600</u>		4,500	
Total	<u>\$6,700</u>	<u>\$6,600</u>			\$6,600
Inventory valuation			<u>\$6,100</u>	<u>\$6,500</u>	<u>\$6,600</u>
Loss recognition			<u>\$ 600</u>	<u>\$ 200</u>	<u>\$ 100</u>

The use of three alternative methods to account for the *same economic events* is inappropriate, since the qualitative characteristic of *comparability* among companies is enhanced when only one method is allowed. However, in many situations there will be no material differences from the use of the alternative methods. The most common practice is to apply the lower of cost or market rule to each individual item since it is required for income tax purposes and is the most conservative alternative. Of course, the method chosen should be applied consistently each period.

Once the inventory is reduced to market, it is *not* written back up to cost even if the market value subsequently rises above cost. Effectively, the written-down value becomes the new “cost” for subsequent valuation purposes. If the company is using the FIFO or average cost flow assumptions this affects the cost of goods sold in the next period. Therefore, the company may *implicitly* recognize recoveries of losses, as we show in the next section.

3. *Accounting Research Bulletin No. 43, op. cit., par. 10.*

## Recording the Reduction of Inventory to Market

It is acceptable for a company to record the write-down of inventory cost to market value directly in its inventory and cost of goods sold accounts (*direct method*). However, it is more desirable to use a separate inventory valuation account and a loss account (*allowance method*) so that the effects of the write-down can be clearly identified. We illustrate the journal entries for both methods in Example 9-3 for a company using FIFO and the periodic inventory system that has the following inventory values:

	Cost	Market
December 31, 2006	\$20,000	\$20,000
December 31, 2007	25,000	22,000
December 31, 2008	30,000	28,000

	Periodic Inventory System	
	Direct Method	Allowance Method
<i>December 31, 2007</i>		
1. To close beginning inventory:		
Income Summary	20,000	20,000
Inventory		20,000
2. To record ending inventory:		
Inventory	22,000	25,000
Income Summary		25,000
3. To record inventory at market:		
Loss Due to Market Valuation	Not required	3,000
Allowance to Reduce Inventory to Market		3,000
<i>December 31, 2008</i>		
1. To close beginning inventory:		
Income Summary	22,000	25,000
Inventory		25,000
2. To record ending inventory:		
Inventory	28,000	30,000
Income Summary		30,000
3. To record inventory at market:		
Allowance to Reduce Inventory to Market	Not required	1,000
Loss Recovery Due to Market Valuation		1,000

### LCM: Direct Method (Periodic)

In the *direct method*, the company includes the \$3,000 decline in the value of the inventory at the end of 2007 in the year-end closing entry by recording the ending inventory at its lower *market* value of \$22,000. Consequently, the Inventory account balance is \$3,000 *lower* and Cost of Goods Sold is \$3,000 *higher* than they otherwise would be. This lower inventory value of \$22,000 is the beginning inventory for 2008. At the end of 2008 the market value is \$2,000 below the cost of \$30,000, and so the market value of \$28,000 is included in the closing entry. The effect of the value of the beginning and ending inventory on cost of goods sold in 2008 should be considered carefully. The market value of the beginning inventory is \$3,000 below cost, and this causes the cost of goods sold to be \$3,000 *lower* than it otherwise would be. The market value of the ending inventory is \$2,000 below cost, and this causes the cost of goods sold to be \$2,000 *higher* than it otherwise would be. Therefore, the net effect is that the cost of goods sold is \$1,000 lower and gross profit (and income) is \$1,000 higher in 2008, because the lower of cost or market value method is used.

### LCM: Indirect Method (Periodic)

The same net results are obtained when the *allowance* method is used. However, the method reveals more information about the effect of the lower of cost or market method on a company's cost of goods sold. In the allowance method, a company records the amount by which the market value is below cost in an Allowance account, and shows the effect on the cost of goods sold explicitly in a Loss (or Loss Recovery) account. In the closing entry at the end of 2007, the company records the inventory at its cost of \$25,000, and records the decline in value of \$3,000 separately in the Loss account and the Allowance account. At the end of 2008 the company records the inventory in the closing entry at its cost of \$30,000. As we discuss later, the net effect of recording the beginning inventory at a book value of \$3,000 below cost and the ending inventory at a book value of \$2,000 below cost is to make cost of goods sold \$1,000 lower than it otherwise would be. Therefore, the company reduces the Allowance account by \$1,000 and recognizes a Loss Recovery of \$1,000. These losses and recoveries are shown as adjustments to cost of goods sold (as in the example in Example 9-4) and therefore disclose more information than the direct method. However, many companies may combine the two amounts in their published financial statements by reporting just the net amount of the inventory and a single amount for the cost of goods sold.

### LCM: Perpetual

If the company was using a perpetual inventory system instead of a periodic system, the net results would again be the same. The journal entries to record the reductions to market would be as follows:

	Direct Method		Allowance Method	
	2007	2008	2007	2008
Cost of Goods Sold	3,000	2,000		
Inventory	3,000	2,000		
Loss (Loss Recovery) due to Market Valuation			3,000	1,000
Allowance to Reduce Inventory to Market			3,000	1,000

If the company was using the *direct* method, it would recognize the reduction of \$3,000 in the 2007 ending inventory by increasing cost of goods sold and reducing inventory. In 2008 it recognizes the reduction of \$2,000 in the ending inventory in exactly the same way. Again note that the net effect of the reduction of the beginning and ending inventory (\$3,000 and \$2,000, respectively) on cost of goods sold in 2008 is that it is \$1,000 lower than it would otherwise be. If the company was using the *allowance* method, the amount it records in the Allowance and in the Loss (or Loss Recovery) accounts is the same as for the periodic method.

### LCM: Reporting

We show the financial statement reporting of the direct and allowance methods for the periodic inventory method in Example 9-4, assuming purchases in each year are \$100,000. The advantage of the allowance method is that it clearly discloses the loss and loss recovery in the company's income statements (but not as extraordinary items) and the valuation adjustment in its respective balance sheets. Although this method is recommended and is used for many companies' internal financial reporting, published financial statements generally do not disclose the size of the loss and the valuation allowance (unless one, or both, is material) but merely disclose that the company is using the lower of cost or market method.

EXAMPLE 9-4 Financial Statement Reporting of the Lower of Cost or Market (LCM) Method			
<b>Direct Method</b>			
<b>Income Statement</b>			
	<u>2007</u>		<u>2008</u>
Beginning inventory	\$ 20,000 (cost)	→	\$ 22,000 (LCM)
Purchases	100,000		100,000
Cost of goods available	<u>\$120,000</u>		<u>\$122,000</u>
Less: Ending inventory	(22,000) (LCM)		(28,000) (LCM)
Cost of goods sold	<u>\$ 98,000</u>		<u>\$ 94,000</u>
<b>Balance Sheet</b>			
	<u>12/31/2007</u>		<u>12/31/2008</u>
Inventory at lower cost or market	<u>\$ 22,000</u>	←	<u>\$ 28,000</u>
<b>Allowance Method</b>			
<b>Income Statement</b>			
	<u>2007</u>		<u>2008</u>
Beginning inventory	\$ 20,000 (cost)	→	\$ 25,000 (cost)
Purchases	100,000		100,000
Cost of goods available	<u>\$120,000</u>		<u>\$125,000</u>
Less: Ending inventory	(25,000) (cost)		(30,000) (cost)
	<u>\$ 95,000</u>		<u>\$ 95,000</u>
Loss (recovery) due to market decline (recovery)	3,000		(1,000)
Cost of goods sold	<u>\$ 98,000</u>		<u>\$ 94,000</u>
<b>Balance Sheet</b>			
	<u>12/31/2007</u>		<u>12/31/2008</u>
Inventory at cost	<u>\$ 25,000</u>	←	<u>\$ 30,000</u>
Less: Allowance to reduce inventory to market	(3,000)	→	(2,000)
Inventory at lower of cost or market	<u>\$ 22,000</u>		<u>\$ 28,000</u>

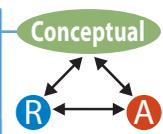

### Lower of Cost or Market and Interim Financial Statements

APB Opinion No. 28 specifies that if a company experiences a temporary market decline in an interim period the company should ignore the decline in its interim financial statements. If the company is unlikely to recover the decline, it should recognize the amount. If the company recognizes a decline and then reverses it in a later *interim* period, it should recognize a loss recovery and increase the inventory value by the amount of the recovery, but only up to the original cost.<sup>4</sup>

### CONCEPTUAL EVALUATION OF LOWER OF COST OR MARKET

The reduction of the value of the inventory to market and the recognition of a loss are appropriate for both a company's balance sheet and income statement. As we discussed in Chapter 4, *FASB Statement of Concepts No. 6* defines *assets* as "probable future economic benefits." When the cost of the inventory exceeds the expected benefits, the lower market value is a better

4. "Interim Financial Reporting," *APB Opinion No. 28* (New York: AICPA, 1973), par. 14(c).

2 Explain the conceptual issues regarding the lower of cost or market method.

measure of the expected benefits. In other words, an unrecoverable cost is not an asset. As we discussed in Chapter 5, the *Statement* also defines *losses* as “decreases in net assets from peripheral or incidental transactions . . . and other events . . . except those that result from expenses or distributions to owners.” Thus a company should recognize the decline in value of the inventory as a reduction in the income of the period in which the loss occurs.

Although the lower of cost or market method is applied to all cost flow assumptions, it is unlikely that it will be used with LIFO because the replacement cost should not be less than the LIFO cost. Such a situation would be very unusual, especially since LIFO is used when there is an expectation of rising costs.

A major criticism of the lower of cost or market rule is that it is applied only in one direction. Declines and (holding) losses are recognized but increases and (holding) gains are not. Obviously this is inconsistent, but it is justified by the conservatism (prudence) convention. Conservatism requires a company to recognize all losses that it can reasonably expect and to anticipate no possible gains, which is what the lower of cost or market rule achieves. Some users argue that the market value of inventory should be recognized when the replacement cost is *higher* than the historical cost. They argue that the replacement cost of the inventory is *reliable* regardless of its relationship to historical cost. Furthermore, they argue that the valuation of inventory at replacement cost (when higher than historical cost) is *relevant* because it better reflects the **cash flow potential** of the inventory and enhances the predictive value of the information. This valuation, however, is not allowed under generally accepted accounting principles, because it would be a violation of the historical cost principle.

It could be argued that another principle, the *revenue recognition* principle, is violated by the lower of cost or market method. This is because a loss is recognized before the earning process is complete and before an exchange transaction has occurred. Modification of the revenue recognition principle is justified in these circumstances because the decline in the value of the company’s inventory is an **economic event of the period** that has caused a reduction in its stockholders’ equity. Therefore the loss should be included in the determination of income. However, the revenue recognition principle may be used to support the nonrecognition of increases in value, because the total difference between selling price and cost is usually recognized in the period of the sale. Also, recognition of an increase in the value of the inventory would require the recognition of income and would be a violation of the revenue recognition principle.

Since a company recognizes a loss in the period of the market decline, its income will be *higher* in the subsequent period when the inventory is sold than it would otherwise have been. In other words, the loss is transferred from the future period of the sale to the current period of the decline in market value. Total income over the two periods will be the same whether or not the lower of cost or market rule is used. This is shown by the earlier

Credit: ©Getty Images/PhotoDisc

example in which recording the inventory at the lower of cost or market caused income to be lower by \$3,000 in 2007 and higher by \$1,000 in 2008. If the company recorded the inventory at cost in a subsequent year(s), its income will be higher by the \$2,000 remaining in the Allowance account in that year(s). Therefore the company's total income over the years in which it recorded inventory at lower of cost or market will be the same as if it had recorded the inventory at cost for those years. This occurs because the beginning and ending inventory for the several years are both at cost.

## LINK TO ETHICAL DILEMMA

Your company, Acquirer Inc., has recently acquired a related business, TargetCo, to take advantage of possible synergies. You have been appointed CFO of TargetCo and hope to restore it to profitability. You realize that this will not be an easy task and that this opportunity will make or break your career. One of your first priorities is for your staff to conduct an extensive review of the value of TargetCo's inventory. The resulting review determines that approximately 10% of the inventory should be written down under the lower of cost or market rule. However, to be conservative, you authorize a 25% reduction in the inventory valuation that you term a restructuring charge. Discuss the ethical implications.

## LINK TO INTERNATIONAL DIFFERENCES

International accounting standards also require the use of the lower of cost or market method. However, market is defined as net realizable value and should typically be applied to individual items. International accounting standards also allow a reversal of a write-down and require disclosures about inventory that is written down, as well as any reversals.

## PURCHASE OBLIGATIONS AND PRODUCT FINANCING ARRANGEMENTS

Accounting principles generally require that a company not record a purchase obligation in its accounts (except in governmental accounting), because neither an asset nor a liability is created by placing an order. **If a company has incurred an unconditional purchase obligation at a definite price, the company discloses this commitment in a note to its financial statements.**<sup>5</sup> This disclosure is required because the commitment is important for the prediction of the cash outflows that the company will make in the future.

If a company has an unconditional (noncancelable) purchase obligation to acquire inventory and the current market price (i.e., replacement cost) is less than the fixed purchase price, the company must recognize the loss in the period in which the decline occurs. This procedure is consistent with the conservatism principle and also

**3** Understand purchase obligations and product financing arrangements.

Reporting

5. "Disclosure of Long-Term Obligations," *FASB Statement of Financial Accounting Standards No. 47* (Stamford, Conn.: FASB, 1981), par. 7.

provides the users of the financial statements with information about the decision-making ability of the management. For example, if a company entered into a noncancelable commitment to purchase inventory at a fixed price of \$500,000 and the market price (replacement cost) at the end of the year is \$450,000, it would make the following year-end adjusting entry:

Loss on Purchase Commitments	50,000	
Accrued Loss on Purchase Commitments		50,000

The company reports the accrued loss as a liability on its year-end balance sheet.

The company writes it off the accrued loss when it purchases the goods as follows:

Inventory (or Purchases)	450,000	
Accrued Loss on Purchase Commitments	50,000	
Accounts Payable		500,000

If the market price rises by the time the company makes the purchase, it reduces the accrued loss and recognizes a loss recovery. It then records the purchases at the market price (cost) on the date of acquisition.

The company accrues the loss only when there is a loss on a *noncancelable* purchase commitment. Such a loss is a contingent loss and is recognized because it is probable and can be reasonably estimated, as we discussed in Chapter 4. Losses on *cancelable* purchase commitments are not accrued because it is assumed that the purchase commitment can be canceled and the loss avoided.

Some companies have engaged in product financing arrangements as a way of financing the cost of inventory before the sale to the ultimate purchaser occurs. **In a product financing arrangement the company “sells” the inventory to another company. Then, in a related transaction, it agrees to purchase the inventory (or a substantially identical item) back from the other company at specified prices over specified periods.** Typically the inventory is not delivered to the “buyer” and is repurchased at a higher price, the difference being an interest charge. When the “sale” under the product financing arrangement occurs, the transaction is similar to borrowing cash with the inventory being used as collateral, sometimes referred to as a “parking” transaction. Thus, according to **FASB Statement No. 49**, the company does *not* record sales revenue but instead records the proceeds received as a liability.<sup>6</sup> This procedure avoids the overstatement of revenues and stockholders’ equity and the understatement of liabilities. As a result of not recording a sale, the inventory also remains in the accounts at cost. Note, however, that this *Statement* does *not* apply to agreements to repurchase at prices that are not specified.

## VALUATION ABOVE COST

### 4 Explain the valuation of inventory above cost.

We stated earlier in this chapter that the lower of cost or market method does not result in a valuation of inventory above cost. However, generally accepted accounting principles do allow a company to value its inventory above cost in certain circumstances. **Accounting Research Bulletin No. 43** states that in exceptional cases inventories may be reported above cost. For example, precious metals having a fixed monetary value with no major cost of marketing may be reported above cost. Any other exceptions must be justified by an inability to determine appropriate costs, immediate marketability at a quoted market price, and unit interchangeability. When goods are reported above cost, this fact should be fully disclosed. Inventories of agricultural, mineral, and other products, where

6. “Accounting for Product Financing Arrangements,” *FASB Statement of Financial Accounting Standards No. 49* (Stamford, Conn.: FASB, 1981).

units are interchangeable and are immediately marketable at quoted prices, and for which appropriate costs may be difficult to obtain may also be reported above cost.<sup>7</sup>

Real Report 9-1 shows an example of valuation at market prices for **ConAgra Foods**. Justification for this method exists when it is highly certain that the inventory can be sold at the market price. Such a situation indicates that the income is earned by production rather than by sale. Therefore, valuation at market, above cost, is appropriate. However, this practice violates the conservatism principle and the usual application of the revenue recognition principle, and is acceptable only in selected industries.

### Real Report 9-1 Inventory Valuation Above Cost

#### ConAgra Foods

##### *NOTE 1: Summary of Significant Accounting Policies (in part):*

*Inventories* Grain, flour, and major feed ingredient inventories are hedged to the extent practicable and are principally stated at market, including adjustment to market of open contracts for purchases and sales.

##### *NOTE 9: Senior Long-Term Debt, Subordinated Debt and Loan Agreements*

Interest expense incurred to finance hedged inventories has been charged to cost of goods sold.

#### Question:

1. What allows ConAgra to value its inventory at market price instead of cost?

### SECURE YOUR KNOWLEDGE 9-1

- The lower of cost or market (LCM) rule is an application of the conservatism principle that requires a company to write down its inventory to market value when the market value of the inventory has declined below its historical cost.
- In applying the LCM method, market value is defined as the current replacement cost; it is constrained by the net realizable value (ceiling) and the net realizable value less a normal profit margin (floor).
- LCM may be applied to individual inventory items (the most conservative approach), to major categories of inventory items, or to the entire inventory.
- The write-down of inventory cost under the LCM method can be accomplished by recording the write-down using either the:
  - direct method (recorded directly in the inventory and cost of goods sold accounts) or
  - indirect method (recorded in an inventory valuation/allowance account and a loss account).
- Unconditional purchase obligations should generally be disclosed in a note to the financial statements; however, if the market price is less than the fixed purchase price, a loss should be recognized in the period of the decline.
- Product financing arrangements are similar to borrowing cash with inventory as collateral; therefore, a liability is recorded for the proceeds of the transaction.

7. *Accounting Research Bulletin No. 43, op. cit., ch. 4, par. 15 and 16.*

5 Use the gross profit method.

## GROSS PROFIT METHOD

Two commonly used methods of estimating inventory costs are (1) the gross profit method and (2) the retail inventory method (which we discuss in the next section).

A company uses the gross profit method to estimate the cost of the inventory by applying a gross profit rate from previous period(s) to the net sales of the current period. It may be used in the following situations:

1. To determine the cost of the inventory at the end of an interim period without taking a physical count. Because of the cost of taking a physical inventory, a company using a periodic inventory system may use the gross profit method for its internal financial statements. It is also an acceptable method for interim financial statements, provided that the company “disclose the method used at the interim date and any significant adjustments that result from reconciliations with the annual physical inventory.”<sup>8</sup>
2. For the internal or external auditor to check the reasonableness of an inventory cost developed from a physical inventory or perpetual inventory system. Also, the auditor can take a physical inventory count before the end of the year and then estimate the cost of the ending inventory.
3. To estimate the cost of inventory that is destroyed by a casualty, such as a fire.
4. To estimate the cost of the inventory from incomplete records. For example, if a company’s inventory records are destroyed, the inventory can be estimated if the cost of goods available for sale and the sales are known or can be reconstructed.
5. To develop a budget of cost of goods sold and ending inventory from a sales budget.

The gross profit method assumes that a company’s gross profit rate (the rate of gross profit on net sales from the company’s income statement) in the current period is not materially different from that of the previous period(s). If there are any identifiable differences, adjustments should be made, as we discuss later. The steps that a company completes when using the gross profit method include the following:

1. Calculate the historical gross profit rate by dividing the gross profit of the prior period(s) by the net sales of the prior period(s).
2. Estimate the gross profit for the current period by multiplying the historical gross profit rate by the actual net sales for the period.
3. Subtract the estimated gross profit from the actual net sales to determine the estimated cost of goods sold for the period.
4. Subtract the estimated cost of goods sold from the actual cost of goods available for sale (the beginning inventory plus the net purchases) for the period to determine the estimated cost of the ending inventory.

### Example: Gross Profit Method

We show how a company applies the gross profit method in Example 9-5 and list each of the preceding steps in parentheses. The company uses the historical gross profit rate of 40% because it believes this rate is the best estimate of conditions in the current year; that is, no material changes in conditions from previous years have occurred.<sup>9</sup>

8. APB Opinion No. 28, *op. cit.*, par. 14(a).

9. Sometimes a company will express gross profit as a percent of cost of goods sold instead of as a percent of net sales. In this case it must convert the gross profit percent to a percent of net sales before it can apply the gross profit method, as follows:

$$\frac{\text{Gross Profit to Net Sales Ratio}}{\text{Sales Ratio}} = \frac{\text{Gross Profit to Cost of Goods Sold Ratio}}{1 + \text{Gross Profit to Cost of Goods Sold Ratio}}$$

Alternatively, if the gross profit to net sales ratio is known, and calculation of the gross profit to cost of goods sold ratio (often called the markup percentage) is required, the following formula can be used:

$$\frac{\text{Gross Profit to Cost of Goods Sold Ratio}}{\text{Goods Sold Ratio}} = \frac{\text{Gross Profit to Net Sales Ratio}}{1 - \text{Gross Profit to Net Sales Ratio}}$$

**EXAMPLE 9-5** Estimating Cost of Ending Inventory by Gross Profit Method**Given Information**

Beginning inventory, at cost \$ 10,000  
 Net purchases for the period 90,000  
 Net sales for the period 130,000  
 Estimated historical gross profit rate (on net sales) 40% (1)

**Estimation of Ending Inventory**

Beginning inventory, at cost		\$ 10,000
Net purchases		90,000
Cost of goods available for sale		\$100,000
Less: Estimated cost of goods sold:		
Net sales	\$130,000	
Gross profit rate	0.40	
Estimated gross profit	\$ 52,000 (2)	
Cost of goods sold (\$130,000 – \$52,000)		(78,000) (3)
Estimated cost of ending inventory		<u>\$ 22,000 (4)</u>

One step may be removed from the calculation shown in Example 9-5. Since the gross profit is 40% of net sales, the cost of goods sold is 60% of net sales. Therefore, the cost of goods sold could be calculated directly as \$78,000 (60% × \$130,000). ♦

**Conceptual Evaluation of the Gross Profit Method**

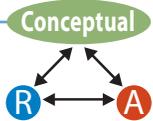

The gross profit method is useful in the situations outlined at the beginning of this section, but the relevance of the results depends on the accuracy of the gross profit percentage. Three modifications may enhance its accuracy.

First, a company should adjust the gross profit rate for known changes in the relationship between its gross profit and net sales. For example, if the company's costs of purchases have increased, but it has not passed on the increases to customers through increased sales prices, it should reduce the gross profit percentage accordingly. The company may also need to adjust the gross profit rate if its productivity or sales (and purchases) returns and allowances have changed.

Second, a company may use a separate gross profit rate for each department or type of inventory that has a different markup percentage. It would then apply separate rates to each department's net sales, and add the resulting amounts to compute the total inventory. Use of a single, overall gross profit rate assumes that all types of inventory are sold or held in inventory in equal proportions at all times. Since this is unlikely, use of separate gross profit rates enhances the accuracy of the cost of the ending inventory and the cost of goods sold.

Third, a company may use an average gross profit rate based on several past periods to average out period-to-period fluctuations. However, use of an average rate assumes that no significant changes occurred over the periods selected for calculating the average rate and that the company made no adjustments to account for such changes. The use of an average rate is particularly appropriate when there are relatively stable costs, selling prices, and operating methods.

The ending inventory estimated by the gross profit method is consistent with the cost flow assumption previously (and currently) used by the company. This occurs because the gross profit rate is based on past results developed from using the particular cost flow assumption. However, if there has been a special situation in the past, such as the reduction of the inventory to market, or a liquidation of LIFO inventory, the gross profit rate must be adjusted.

**6** Understand the retail inventory method.

## RETAIL INVENTORY METHOD

The retail inventory method is used widely to estimate the cost of inventory when there is a consistent pattern between the cost of a company's purchases and selling prices. This pattern may exist either for the whole company or for identifiable departments within the company. The method is best used by retail stores where prices often are set based on a consistent markup above cost and the accounting systems are based on retail values rather than costs. The retail inventory method can be applied based on the average, FIFO, and LIFO cost flow assumptions, and the lower of cost or market method can be used with each. The retail inventory method is widely used because it is allowed under generally accepted accounting principles and for income tax purposes.

The retail inventory method requires a company to use the following information:

1. Beginning inventory at cost and retail
2. Goods purchased at cost and retail
3. Changes in selling price resulting from additional markups and markdowns
4. Sales

Assuming that a company uses the retail inventory method with the *average* cost flow assumption, the following steps are necessary:

1. Compute the total goods available for sale (beginning inventory plus purchases) at both cost and retail value (selling price).
2. Compute a cost-to-retail ratio by dividing the cost of the goods available for sale by the retail value of the goods available for sale.
3. Compute the ending inventory at retail by subtracting the sales for the period from the retail value of the goods available for sale.
4. Compute the ending inventory at cost by multiplying the ending inventory at retail by the cost-to-retail ratio.

### Example: Retail Inventory Method

We show how a company applies the retail inventory method using the following simplified data:

	Cost	Retail
Beginning inventory	\$10,000	\$17,000
Purchases	50,000	83,000
Sales		80,000

The ending inventory at cost is computed as follows (and we list each of the preceding steps in parentheses):

	Cost	Retail	
Beginning inventory	\$ 10,000	\$ 17,000	
Purchases	<u>50,000</u>	<u>83,000</u>	
Goods available for sale	<u>\$60,000</u>	\$ 100,000	(1)
Cost-to-retail ratio: $\frac{\$ 60,000}{\$ 100,000} = 0.60$ <span style="float: right;">(2)</span>			
Less: Sales		<u>(80,000)</u>	
Ending inventory at retail	\$ _____	<u>20,000</u>	(3)
Ending inventory at cost (0.60 x \$20,000)	<u>\$12,000</u>		(4) ♦

## Retail Inventory Method Terminology

In the preceding example we assumed that the retail value of the goods available for sale is the original sales price, and that the company made no subsequent changes in retail prices. However, the typical retail store makes many changes in selling prices after setting the original price. (For the average retail food store there are likely to be hundreds of changes each week.) The following seven terms describe these changes:

1. *Markup*. The original markup from cost to the first selling price (also known as *mark-on*).
2. *Additional Markup*. An increase above the original sales price.
3. *Markup Cancellation*. A reduction in the selling price after there has been an additional markup. The markup cancellation cannot be greater than the additional markup.
4. *Net Markup*. The total additional markups less the total markup cancellations.
5. *Markdown*. A decrease below the original sales price.
6. *Markdown Cancellation*. An increase in the selling price after there has been a markdown. The markdown cancellation cannot be greater than the markdown.
7. *Net Markdown*. The total markdowns less the total markdown cancellations.

To illustrate the meaning of these terms, suppose that a company purchased an item for \$6 and initially priced the item to sell for \$10. The markup is \$4. If the company subsequently increases the selling price to \$12, there is an additional markup of \$2. If it then lowers the selling price to \$7, there is a markup cancellation of \$2 and a markdown of \$3. If the company then raises the selling price to \$8, there is a markdown cancellation of \$1. The net markup is zero ( $\$2 - \$2$ ), and the net markdown is \$2 ( $\$3 - \$1$ ).

## Application of the Retail Inventory Method

In the simplified example shown earlier, we used the average cost flow assumption. However, companies may use the retail inventory method to develop inventory valuations under four alternatives (we do not illustrate the lower of cost or market used with FIFO and LIFO):

1. *FIFO*. Exclude the cost and the retail value of the beginning inventory from the computation of the cost-to-retail ratio for the period. The ratio includes both net markups and net markdowns.
2. *Average Cost*. Include the cost and the retail value of the beginning inventory and net markups and markdowns in the cost-to-retail ratio.
3. *LIFO*. Compute separate ratios for each layer in the beginning inventory and for the purchases of the current period; include both net markups and net markdowns in the cost-to-retail ratio for the current period.
4. *Lower of Average Cost or Market*. Include the cost and retail value of the beginning inventory and net markups in the cost-to-retail ratio. Thus, the net markdowns are excluded from the computation of the cost-to-retail ratio. This method is also known as the *conventional retail* method.

We summarize the calculation of the cost-to-retail ratio of the current period for each of the alternative methods as follows:

	FIFO	Average Cost	LIFO*	Lower of Average Cost or Market
Beginning inventory	Exclude	Include	Exclude	Include
Purchases	Include	Include	Include	Include
Markups (net)	Include	Include	Include	Include
Markdowns (net)	Include	Include	Include	Exclude

\*A separate cost-to-retail ratio is also computed for each layer in the beginning inventory.

Note that these alternative methods differ in the calculation of the cost-to-retail ratio. However, the net markups and markdowns *always* are added and subtracted in order to compute the retail value of the ending inventory. Also note that markups and markdowns are recorded only at *retail*. We show each of these methods in the following sections, using the data for the Thompson Company given in Example 9-6.

**EXAMPLE 9-6 Thompson Company Inventory Cost and Retail Value**

	Cost	Retail
Beginning inventory	\$20	\$ 35
Purchases	40	80
Net markups	—	5
Net markdowns	—	(10)
Goods available for sale	<u>\$60</u>	<u>\$110</u>
Sales		(66)
Ending inventory at retail		<u>\$ 44</u>

*Note:* It is assumed that the beginning inventory is valued at a cost of \$20 for all flow assumptions, although this value would be different for different cost flow assumptions because the beginning inventory for the current period is the ending inventory of the previous period.

**FIFO**

Under the FIFO cost flow assumption the beginning inventory is excluded from the computation of the cost-to-retail ratio for the period. The Thompson Company would compute the cost of its ending inventory as \$23.45, as we show in Example 9-7.

**EXAMPLE 9-7 Retail Inventory Method — FIFO**

	Cost	Retail
Purchases	\$40	\$ 80
Net markups		5
Net markdowns		(10)
	<u>\$40</u>	<u>\$ 75</u>
Cost-to-retail ratio: $\frac{\$40}{\$75} = 0.533$ (for purchases)		
Beginning inventory	<u>20</u>	<u>35</u>
Goods available for sale	<u>\$60</u>	<u>\$110</u>
Less: Sales		(66)
Ending inventory at retail		<u>\$ 44</u>
Ending inventory at FIFO cost ( $0.533 \times \$44$ )	<u>\$23.45</u>	

Excluding the beginning inventory from the computation of the cost-to-retail ratio produces the layering effect of FIFO for cost of goods sold. Since the ending inventory cost is based only on the activities of the current period, the entire beginning inventory

is included in the cost of goods sold. Therefore the *cost of goods sold* is made up of two layers as follows:

	Cost	Retail
Beginning inventory	\$20.00	\$35
Purchases at retail		31
Purchases at cost ( $\$31 \times 0.533$ )	<u>16.52</u>	
	<u>\$36.52</u>	<u>\$66</u>

Thus the cost of goods available for sale of \$60 is allocated (amounts rounded) between cost of goods sold (\$36.52) and ending inventory (\$23.45).<sup>10</sup>

### Average Cost

Under the average cost flow assumption the beginning inventory and the net markups and markdowns are included in the cost-to-retail ratio. The Thompson Company would estimate the cost of its ending inventory as \$24, as we show in Example 9-8.

EXAMPLE 9-8 Retail Inventory Method — Average Cost		
	Cost	Retail
Beginning inventory	\$20	\$ 35
Purchases	40	80
Net markups		5
Net markdowns		<u>(10)</u>
Goods available for sale	<u>\$60</u>	<u>\$110</u>
Cost-to-retail ratio: $\frac{\$60}{\$110} = 0.545$		
Less: Sales		<u>(66)</u>
Ending inventory at retail		<u>\$ 44</u>
Ending inventory at average cost ( $0.545 \times \$44$ )	<u>\$24</u>	

There are similarities between applying this average cost flow assumption and the more general average cost method we discussed in the preceding chapter. The beginning inventory and the purchases are combined. Since the company sold at retail 60% ( $\$66 \div \$110$ ) of the goods available for sale, 40% of the goods are left in ending inventory. The cost of the inventory is \$24, which is 40% of the cost of the goods available for sale ( $40\% \times \$60 = \$24$ ).

### LIFO

Separate cost-to-retail ratios for the beginning inventory and the purchases must be calculated when the LIFO cost flow assumption is applied to the retail inventory method.

10. Note that in this example we assumed that the units sold during the period exceed the units in the beginning inventory; therefore, under FIFO the company includes the cost of the entire beginning inventory in cost of goods sold during the current period. If some of the beginning inventory still remained at the end of the period, the ending inventory would include two layers, each with its own cost-to-retail ratio.

The ratio for the purchases includes both markups and markdowns if the cost basis is used. (Remember that a company may use LIFO for income tax purposes only if it also uses LIFO for financial reporting.) The layers of inventory are accounted for by using the same principles as those discussed in Chapter 8. The Thompson Company would compute the cost of its ending inventory as \$24.80, as we show in Example 9-9.

**EXAMPLE 9-9 Retail Inventory Method — LIFO**

	Cost	Retail
Beginning inventory	\$20	\$ 35
Cost-to-retail ratio: $\frac{\$20}{\$35} = 0.57$ (for beginning inventory)		
Purchases	40	80
Net markups		5
Net markdowns		(10)
		<u>\$ 75</u>
Cost-to-retail ratio: $\frac{\$40}{\$75} = 0.533$ (for purchases)		
Goods available for sale	<u>\$60</u>	<u>\$110</u>
Less: Sales		(66)
Ending inventory at retail		<u>\$ 44</u>
Ending inventory at LIFO cost:		
→ \$35 × 0.57 (beginning inventory layer)	\$20.00	
→ \$ 9 × 0.533 (added layer)	4.80	
	<u>\$24.80</u>	

The company had sales of \$66, which left an inventory at retail of \$44. This inventory consists of two layers, one of which is the base inventory at retail of \$35, and the other an addition at retail of \$9. Each layer is converted to cost at its own cost-to-retail ratio. Another way of looking at this example is to see that the Thompson Company sold 88% ( $\$66 \div \$75$ ) of the goods purchased during the period. Therefore at cost the company sold \$35.20 ( $88\% \times \$40$ ) of the purchases, leaving \$4.80 ( $\$40 - \$35.20$ ) as an added layer in inventory.

Note that in the Thompson Company example, the LIFO method does not produce the lowest ending inventory cost (in comparison to FIFO or average). The reason is that the cost-to-retail ratio for the purchases is less than the cost-to-retail ratio for the beginning inventory. This situation was caused by the large markdowns during the period, indicating the existence of falling costs. These may be caused by a decline in the prices charged by the supplier or by obsolescence due to a change in tastes or the season of the year. When costs are rising, the retail method using LIFO will produce a lower inventory cost.

If there was a decrease in inventory over the period, the ending inventory would include only of a portion of the beginning inventory, and there would be no need to compute a cost-to-retail ratio for the purchases of the current period. In more complex situations the beginning inventory would include LIFO layers, each with its own cost-to-retail ratio, and the decrease would be removed according to the general LIFO principles discussed in the preceding chapter.

### Lower of Average Cost or Market

The retail inventory method can be used with lower of cost or market under either the average, FIFO, or LIFO cost flow assumptions. In all three cases, net markdowns are excluded from the cost-to-retail ratio for the period to achieve the effects of the lower of cost or market method. Because the lower of average cost or market is commonly used, we will illustrate this alternative. The calculations follow the average cost example earlier, except that the net markdowns are *excluded* from the computation of the cost-to-retail ratio. The Thompson Company would compute the value of its ending inventory as \$22, as we show in Example 9-10.

<b>EXAMPLE 9-10 Retail Inventory Method — Lower of Average Cost or Market</b>		
	<b>Cost</b>	<b>Retail</b>
Beginning inventory	\$20	\$ 35
Purchases	40	80
Net markups		5
	<u>\$60</u>	<u>\$120</u>
Cost-to-retail ratio: $\frac{\$60}{\$120} = 0.50$		
Net markdowns		(10)
Goods available for sale	<u>\$60</u>	<u>\$110</u>
Less: Sales		(66)
Ending inventory at retail		<u>\$ 44</u>
Ending inventory at lower of cost or market ( $0.50 \times \$44$ )	<u>\$22</u>	

Since the net markdowns are excluded from the computation of the cost-to-retail ratio, the denominator of the ratio is higher (\$120 in Example 9-10 as compared to \$110 in Example 9-8). Therefore, the ratio is lower (0.50 versus 0.545) and the cost of the ending inventory is lower (\$22 versus \$24). We discuss the assumptions for this calculation later in the chapter.

### Additional Cost and Retail Adjustments

A company has to consider how to treat other costs and activities when it applies the retail inventory method. The cost of purchases includes the costs directly or indirectly incurred in bringing the items to their existing condition and location (as we discussed in Chapter 8). Two items that affect net purchases are (1) freight charges, which are added to the cost of purchases, and (2) purchases discounts taken under the gross price method, which are subtracted from the cost of purchases. These two items affect only the *cost* of purchases and not the retail amount of purchases, because it is assumed that the original markup applied to the invoice cost by the company covers such incidental items. A third item that affects net purchases is purchases returns and allowances. Once the purchases are recorded by a company at retail, any subsequent purchases returns and allowances are subtracted from *both the cost and the retail value* of the purchases so as not to distort the computation of the cost-to-retail ratio.

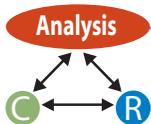

Several items also affect the estimate of the ending inventory at retail. Sales returns and allowances are subtracted from sales at retail to determine net sales. Net sales are then subtracted from goods available for sale at retail to compute ending inventory at retail. Sales discounts taken are *not* deducted to determine the ending inventory at retail, because they

are considered to be financing items and not part of the original markup. Inventory shrinkage due to breakage and theft is a common problem in retail stores. Therefore, whenever the retail inventory method is used for interim financial statements, an estimate should be made of normal shrinkage (such as 1% of sales) based on past experience. This estimate is then subtracted, in addition to the usual items, to determine the ending inventory at retail. An estimate is not necessary at year-end because a physical inventory is taken. Employee discounts—discounts from the normal sales price that are made available to employees—also are subtracted to compute ending inventory at retail (in the same way as sales). Both inventory shrinkage and employee discounts are subtracted because they are normal costs incurred by the company and therefore were reflected in the retail selling price determined by the original markup. Abnormal inventory spoilage would be subtracted at both cost and retail to determine the goods available for sale so as not to distort the cost-to-retail ratio.

### Comparison of Methods

The retail inventory method is similar to the gross profit method because it estimates inventory based on a profit percentage. It differs, however, and is more sensitive to price changes because it uses a current-period estimate of the profit percentage, whereas the gross profit method uses an estimate based on past periods. This similarity is summarized as follows:

Gross Profit Method	Retail Inventory Method
Beginning inventory at cost	Beginning inventory at retail
+ Purchases at cost	+ Purchases at retail
= Cost of goods available	= Retail value of goods available
– Cost of goods sold	– Retail value of goods sold (sales)
<u>[sales × (1 – estimated gross profit rate)]</u>	= Ending inventory at retail
	<u>× actual cost-to-retail ratio</u>
= Ending inventory at cost	= Ending inventory at cost

The major advantages of the retail inventory method are:

1. It allows a company to prepare interim reports without taking a physical inventory; but as with any inventory system, the company should take a physical count at least annually.
2. It simplifies a company’s record-keeping procedures because the company does not need to keep track of the costs of *individual* purchases and does not have to relate them to the particular units in inventory. In addition, retail stores typically price and display merchandise immediately, and base their record keeping on retail prices.
3. It speeds up verifying a company’s ending inventory by physical count because the company records the inventory in the retail store at retail values and can therefore compare it directly with the accounting records, which are also based on retail prices. Thus, the company does not need to refer to the individual purchase invoices to determine the cost of each item.

### CONCEPTUAL EVALUATION OF THE RETAIL INVENTORY METHOD

Two general assumptions underlie the retail inventory method. The first is that the items in a company’s inventory are sufficiently homogeneous so that all have the same markup. Or, if they have different markups, that the proportion of the different items in the ending inventory is the same as that in the goods available for sale. The company can reduce the limitations of this assumption by using a separate cost-to-retail ratio for each category of inventory or for each department. The second general assumption is that the cost-to-retail

7 Explain the conceptual issues regarding the retail inventory method.

ratio remains constant over the accounting period or that changes in the retail prices parallel the changes in the costs of purchases. The limitations of this assumption can also be reduced by weighting the different cost-to-retail ratios by the volume of activity for inventory items under each ratio.

Since the lower of average cost or market method is the most used version of the retail inventory method, it is important to consider whether this method actually does result in an inventory at lower of cost or market, or just a value that is lower than cost. We evaluate this in the three examples of Example 9-11, which use the same basic information for the Thompson Company.

<b>EXAMPLE 9-11 Assumptions Underlying the Use of the Retail Inventory Method: Lower of Average Cost or Market</b>						
	<b>Example 1 (no markdowns)</b>		<b>Example 2 (no markups)</b>		<b>Example 3 (all markdowns sold)</b>	
	<b>Cost</b>	<b>Retail</b>	<b>Cost</b>	<b>Retail</b>	<b>Cost</b>	<b>Retail</b>
Beginning inventory	\$20	\$ 35	\$20	\$ 35	\$20	\$ 35
Purchases	40	80	40	80	40	80
Net markups		5		—		5
	<u>\$60</u>	<u>\$120</u>	<u>\$60</u>	<u>\$115</u>	<u>\$60</u>	<u>\$120</u>
Cost-to-retail ratio:		0.50 <sup>1</sup>		0.52 <sup>2</sup>		0.50 <sup>3</sup>
Net markdowns		—		(10)		(10)
Goods available for sale	<u>\$60</u>	<u>\$120</u>	<u>\$60</u>	<u>\$105</u>	<u>\$60</u>	<u>\$110</u>
Less: Sales		(72) <sup>4</sup>		(63) <sup>5</sup>		(62) <sup>6</sup>
Ending inventory at retail		<u>\$ 48</u>		<u>\$ 42</u>		<u>\$ 48</u>
Ending inventory at lower of cost or market	<u>\$24<sup>7</sup></u>		<u>\$21.91<sup>8</sup></u>		<u>\$24<sup>9</sup></u>	

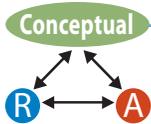

<sup>1</sup> $\frac{\$60}{\$120} = 0.50$	<sup>2</sup> $\frac{\$60}{\$115} = 0.52$	<sup>3</sup> $\frac{\$60}{\$120} = 0.50$	<sup>4</sup> $(\$120 \times 60\%)$	<sup>5</sup> $(\$105 \times 60\%)$
<sup>6</sup> $(\$120 \times 60\% - \$10)$	<sup>7</sup> $\frac{\$60}{\$120} \times \$48$	<sup>8</sup> $\frac{\$60}{\$115} \times \$42$	<sup>9</sup> $\frac{\$60}{\$120} \times \$48$	

In all three examples we assume that the company sells 60% of the goods available for sale, but we use different assumptions regarding the markups and markdowns in each example. In the first example we assume that there are only markups and no markdowns. Thus, the cost-to-retail ratio is  $\$60 \div \$120$  and the ending inventory is \$24. This cost is the same as the average cost figure computed in Example 9-8. Since there were no markdowns, it can be assumed that the market value has not declined below cost, and therefore the inventory value is the lower of cost or market.

In the second example we assume that there are no markups but that there are markdowns. This results in a cost-to-retail ratio of  $\$60 \div \$115$  and an ending inventory of \$21.91. Since there are markdowns of \$10, it can be assumed that prices have declined by a factor of  $10 \div 115$ . To reflect this change, the ending inventory is valued at the lower of cost or market, which is \$21.91 [ $\$24 - (\$24 \times 10 \div 115)$ ]. Therefore, in this situation the method again has resulted in an inventory amount equal to the lower of cost or market.

Now refer back to the original computation of the lower of cost or market in Example 9-10. Since \$22 is greater than \$21.91, the \$22 value is *not* the true lower of cost or market of the inventory, but simply a value that is lower than cost. This indicates that the lower of cost or market method is accurate only if the goods in the inventory are perfectly homogeneous. In other words, markups and markdowns for separate items within inventory cannot exist at the same time.

In the third example, again there are both markups and markdowns. The cost-to-retail ratio is  $\$60 \div \$120$ . But now we assume that all the goods that are marked down are sold. Since we also assumed that 60% of the goods available for sale are sold, sales would be equal to 60% of the goods available for sale, less the \$10 markdowns  $[(60\% \times \$120) - \$10 = \$62]$ . The ending inventory is \$24, which is again the lower of cost or market, because we assumed that all goods marked down have been sold and thus the ending inventory contains items that have a retail value that is higher than their cost. Therefore, for the lower of cost or market method to be accurate, the goods in inventory do not have to be perfectly homogeneous if it can be assumed that all the units that have been marked down have been sold.

To summarize, **the lower of average cost or market method is accurate only if either markups and markdowns do not exist at the same time or if all the marked-down items have been sold.** Under other conditions the method produces an inventory value that is less than cost but only approximates the lower of cost or market. We show Wal-Mart's disclosure of its use of the retail method in Real Report 9-2.

### Real Report 9-2 Example of Inventory Disclosure

WAL-MART STORES

<b>Total Current Assets</b>	<b>\$34,421</b>	<b>\$30,722</b>

**NOTES TO FINANCIAL STATEMENTS (IN PART)**

*Inventories*

The Company values inventories at the lower of cost or market as determined primarily by the retail method of accounting, using the last-in, first-out ("LIFO") method for substantially all domestic merchandise inventories, except SAM'S CLUB merchandise, which is based on average cost using the LIFO method. Inventories of foreign operations are primarily valued by the retail method of accounting, using the first-in, first-out ("FIFO") method. Our inventories at FIFO did not exceed inventories of LIFO by a significant amount.

**Questions:**

1. What method does Wal-Mart use to value its inventory? Describe how this method is applied.
2. Why do you think Wal-Mart uses the inventory method you identified in the previous question to value its inventory?
3. Why does Wal-Mart use the retail LIFO inventory method for domestic operations but the retail FIFO inventory method for international operations?

## DOLLAR-VALUE LIFO RETAIL METHOD

We discussed the advantages of the dollar-value LIFO method in Chapter 8, and we discussed the advantages of the retail method earlier in this chapter. Many retail companies take advantage of both these methods by using the dollar-value LIFO retail method, which combines the principles of the retail LIFO method with the dollar-value LIFO method. Although no new principles are involved, we provide an illustration of the dollar-value retail LIFO inventory method for the Weston Company because of the complexity involved. We show the basic information in Example 9-12, and we show the calculation of the cost of the ending inventory in Example 9-13.

**8** Understand the dollar-value LIFO retail method.

### EXAMPLE 9-12 Weston Company Cost and Retail Values and Price Indexes

	2007		2008		2009	
	Cost	Retail	Cost	Retail	Cost	Retail
Jan. 1, inventory	\$ 8,000	\$12,000				
Purchases	20,400	32,000	\$25,600	\$41,000	\$26,040	\$45,000
Net markups		3,000		2,000		1,000
Net markdowns		(1,000)		(3,000)		(4,000)
Sales		(29,800)		(32,240)		(42,990)
Price Index:						
Jan. 1, 2007	100					
Dec. 31, 2007	108					
Dec. 31, 2008	115					
Dec. 31, 2009	120					

Note: It is assumed that LIFO is adopted on January 1, 2007.

In Example 9-13, the cost-to-retail ratio is computed in the same manner as we described earlier for the LIFO retail method. That is, the ratio includes both net markups and net markdowns but excludes the beginning inventory. The dollar-value LIFO concepts are applied to the retail values as follows (the numbers in parentheses are from Example 9-13 for 2007):

1. The ending inventory at retail (\$16,200) is computed by adding the beginning inventory, purchases, and the markups, and subtracting the markdowns and sales. Alternatively, it is computed at year-end by taking a physical inventory in which the number of units in ending inventory is multiplied by the current-year retail prices.
2. The ending inventory at retail (\$16,200) is converted to base-year retail prices (\$15,000) by applying the base-year conversion index:

$$\frac{\text{Ending Inventory at Base-Year Retail Prices}}{\text{Ending Inventory at Retail}} = \frac{\text{Ending Inventory at Retail}}{\text{Ending Inventory at Retail}} \times \frac{\text{Base-Year Retail Price Index}}{\text{Current-Year Price Index}}$$

Note that the conversion index used here is based on a *price* index, while the conversion index used in Chapter 8 was based on a *cost* index. A price index is computed in the same way as a cost index, except that retail prices are used.

3. The increase (decrease) in the inventory at retail in base-year prices is computed by comparing the ending inventory with the beginning inventory when both are measured at retail in base-year prices (an increase of \$3,000).

**EXAMPLE 9-13 Dollar-Value LIFO Retail Inventory Method**

	2007		2008		2009	
	Cost	Retail	Cost	Retail	Cost	Retail
Beginning inventory*	\$ 8,000	\$12,000	\$ 9,944	\$16,200	\$14,238	\$23,960
Purchases	20,400	\$32,000	25,600	\$41,000	26,040	\$45,000
Net markups		3,000		2,000		1,000
Net markdowns		<u>(1,000)</u>		<u>(3,000)</u>		<u>(4,000)</u>
		34,000		40,000		42,000
Goods available for sale	<u>\$28,400</u>	<u>\$46,000</u>	<u>\$35,544</u>	<u>\$56,200</u>	<u>\$40,278</u>	<u>\$65,960</u>
Sales		(29,800)		(32,240)		(42,990)
Ending inventory at retail		<u>\$16,200</u> (1)		<u>\$23,960</u>		<u>\$22,970</u>
Ending inventory at retail at base-year prices:						
\$16,200 × (100 ÷ 108)		\$15,000 (2)				
\$23,960 × (100 ÷ 115)				\$20,835		
\$22,970 × (100 ÷ 120)						\$19,142
Inventory change at retail base-year prices:						
\$15,000 — \$12,000		\$ 3,000 (3)				
\$20,835 — \$15,000				\$ 5,835		
\$19,142 — \$20,835						\$(1,693)
Change at retail at relevant current prices:						
\$3,000 × (108 ÷ 100)		\$ 3,240 (4)				
\$5,835 × (115 ÷ 100)				\$ 6,710		
\$(1,693) × (115 ÷ 100)						\$(1,947)
Change at relevant current costs:*						
\$3,240 × 0.60	\$ 1,944 (5)					
\$6,710 × 0.64			\$ 4,294			
\$(1,947) × 0.64					\$(1,246)	
Year-end LIFO inventory:						
Base-year layer	\$ 8,000		\$ 8,000		\$ 8,000	
Layer added in 2007	1,944		1,944		1,944	
Layer added in 2008			4,294		4,294	
Layer subtracted in 2009 at 2008 costs					(1,246)	
Ending inventory	<u>\$ 9,944</u> (6)		<u>\$14,238</u>		<u>\$12,992</u>	

\*2007 cost-to-retail ratio for beginning inventory:  $\$8,000 \div \$12,000 = 0.667$ ; 2007 cost-to-retail ratio for purchases:  $\$20,400 \div \$34,000 = 0.60$ ; 2008 cost-to-retail ratio for purchases:  $\$25,600 \div \$40,000 = 0.64$ .

4. The increase (decrease) in the inventory at retail in base-year prices (\$3,000) is converted to current-year retail prices (\$3,240) by multiplying by the appropriate conversion index. If there is an *increase*, the current year conversion index is used as follows:

$$\text{Layer Increase at Current-Year Retail Prices} = \frac{\text{Increase at Base-Year Retail Prices}}{\text{Base-Year Price Index}} \times \frac{\text{Current-Year Price Index}}{\text{Base-Year Price Index}}$$

Alternatively, if there is a *decrease*, the conversion index for the appropriate LIFO layer is used as follows:

$$\text{Decrease at Retail Prices of Most Recently Added Layer} = \frac{\text{Decrease at Base-Year Retail Prices}}{\text{Base-Year Price Index}} \times \frac{\text{Price Index of Most Recently Added Layer}}{\text{Base-Year Price Index}}$$

Note that for large decreases that affect more than one layer of inventory, the price index applicable to each layer must be used in the conversion index.

5. The increase (decrease) at current-year retail prices is converted to cost (\$1,944) by multiplying by the cost-to-retail ratio for the appropriate year. If there is an increase, the cost-to-retail ratio for the current year is used (0.60). If there is a decrease, the cost-to-retail ratio(s) for the LIFO layer(s) being removed is used.
6. The ending inventory at cost (\$9,944) is computed by adding (subtracting) the increase (decrease) at cost to the beginning inventory at cost (\$1,944 + \$8,000).

Continuing the example, in 2008 the ending inventory at retail of \$23,960 is converted to base-year retail prices of \$20,835 by multiplying by the base-year conversion index ( $100 \div 115$ ). Comparing the \$20,835 to the ending inventory at retail base-year prices in 2007 of \$15,000 results in an increase in inventory at base-year retail prices of \$5,835. This increase is multiplied by the current-year conversion index of  $115 \div 100$  to compute the increase at current retail prices of \$6,710. The \$6,710 is multiplied by the cost-to-retail ratio of 0.64 to compute the \$4,294 increase at current-year costs, which is added to the \$9,944 ending inventory cost from 2007 to determine the \$14,238 cost of the ending inventory for 2008.

In 2009 there is a *decrease* in the inventory of \$1,693 at base-year retail prices. This is converted into a \$1,947 decrease by applying the conversion index for 2008, since part of the layer added in 2008 is being removed. This decrease of \$1,947 at retail is converted to cost by applying the cost-to-retail ratio for 2008 of 0.64, resulting in a decrease at cost of \$1,246. Note that the conversion index of  $115 \div 100$  and the cost ratio of 0.64 would be used only for a reduction in inventory at base-year retail prices of \$5,835, because this is the amount of the increase from 2008. The next \$3,000 reduction at base-year retail prices would be at the conversion index of  $108 \div 100$  and the cost ratio of 0.60 (for the layer added in 2007) and the remaining \$12,000 at a conversion index of  $100 \div 100$  and the cost ratio of 0.667 (for the beginning inventory from 2007).

## EFFECTS OF INVENTORY ERRORS

In addition to the special methods we described earlier in the chapter, errors made by a company may affect its ending inventory valuation. Errors in the valuation of inventory and the recording of purchases can result in inaccurate values on the company's balance

9 Understand the effects of inventory errors on the financial statements.

sheet and income statement. We summarize the effects of some common errors in Exhibit 9-1 (assuming a periodic inventory system and ignoring income taxes):

#### EXHIBIT 9-1 Effects of Inventory Errors

- I. A purchase on credit is omitted from both the Purchases account and ending inventory and is *not* recorded in the succeeding year.
  - A. Current year**
    1. *Income Statement.* Income is correct because the errors in the purchases and ending inventory offset each other.
    2. *Balance Sheet.* Ending inventory and accounts payable are understated.
  - B. Succeeding year**
    1. *Income Statement.* Income is overstated because beginning inventory is understated and therefore cost of goods sold is understated.
    2. *Balance Sheet.* Accounts payable is understated and retained earnings is overstated. Note that if the purchase omitted from the current year was included in the succeeding year, the income would be correct in the second year because the errors would again offset each other. Accounts payable and retained earnings would also be correct.
  
- II. A purchase on credit is omitted from the Purchases account but ending inventory is correct.
  - A. Current year**
    1. *Income Statement.* Income is overstated because purchases are understated and therefore cost of goods sold is understated.
    2. *Balance Sheet.* Accounts payable is understated because a purchase has been omitted. Retained earnings is overstated because income is overstated.
  - B. Succeeding year**
    1. *Income Statement.* No effect because the beginning inventory, purchases, and ending inventory are correct.
    2. *Balance Sheet.* Accounts payable is understated and retained earnings is overstated, due to the error in the previous period.
  
- III. Ending inventory is over(under)stated due to quantity and/or costing errors, but purchases are correct.
  - A. Current year**
    1. *Income Statement.* Income is over(under)stated because cost of goods sold is under(over)stated.
    2. *Balance Sheet.* Ending inventory and retained earnings are over(under)stated.
  - B. Succeeding year**
    1. *Income Statement.* Income is under(over)stated because beginning inventory is over(under)stated, and therefore cost of goods sold is over(under)stated.
    2. *Balance Sheet.* Correct because the errors in inventory and retained earnings in the previous year were counterbalanced in this year.

Note that in the third situation in Exhibit 9-1 the total income for the two years combined is correct, as is the ending inventory for the succeeding year. For example, assume that a company's periodic inventory at December 31, 2007 is overstated by \$5,000 but purchases are correct. The following errors occur (ignoring income taxes) in the company's financial statements:

2007: *Income Statement.* Cost of goods sold is understated by \$5,000 and income is overstated by \$5,000.

*Balance Sheet.* Ending inventory and retained earnings are overstated by \$5,000.

2008: *Income Statement.* Cost of goods sold is overstated by \$5,000 and income is understated by \$5,000.

*Balance Sheet.* Ending inventory and retained earnings are correct because the errors have counterbalanced each other.

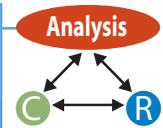

These errors are illustrated by the following equations:

2007:	Beginning Inventory Correct	+ Purchases Correct	= Cost of Goods Sold -\$5,000	+ Ending Inventory +\$5,000
2008:	+\$5,000	Correct	+\$5,000	Correct

An arrow points from the \$5,000 error in the 2007 ending inventory to the \$5,000 error in the 2008 beginning inventory.

Note that if income taxes are considered, the effect of the error on income is reduced. For example, if the company has an income tax rate of 30%, the inventory is still overstated by \$5,000, but net income in 2007 is overstated by only \$3,500 [ $\$5,000 \times (1 - 0.30)$ ] and income taxes payable is increased by \$1,500 ( $\$5,000 \times 0.30$ ). Thus the errors affect more items on the company's balance sheet, but the balance sheet still balances because assets are overstated by \$5,000, liabilities by \$1,500, and stockholders' equity by \$3,500.

Many companies use a perpetual inventory system. Under this system, they still take a physical inventory and may make similar errors. The discovery of inventory errors requires careful analysis and adjusting entries to correct the company's accounts. If a company discovers a material error after it has closed the books, it treats the correction as a prior period adjustment. In this case it corrects the permanent (real) accounts. The company makes the corrections it would have made to temporary (nominal) accounts to Retained Earnings instead, as we discuss in Chapter 23.

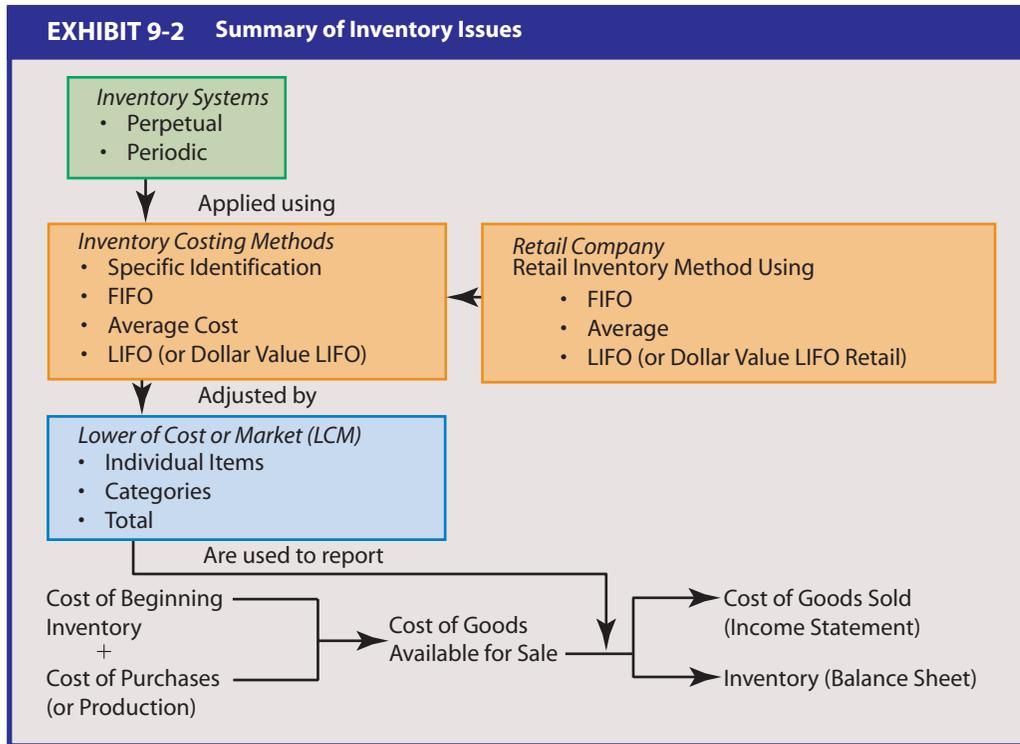

## SECURE YOUR KNOWLEDGE 9-2

- When it is impractical, infeasible, or impossible to perform a physical count of inventory, inventory estimation techniques such as the gross profit method or the retail inventory method may be used.
- The gross profit method estimates the cost of inventory by
  - Calculating a historical gross profit rate,
  - Applying this gross profit rate to the net sales of the current period to get an estimate of gross profit,
  - Subtracting the estimated gross profit from net sales to get estimated cost of goods sold, and
  - Subtracting the estimated cost of goods sold from actual cost of goods available for sale.
- The retail method is a commonly used estimation technique that can produce inventory valuations under FIFO, average cost, LIFO, or lower of average cost or market cost flow assumptions by modifying the calculation of the cost-to-retail ratio. Ending inventory is estimated by:
  - Calculating cost of goods available for sale at both cost and retail,
  - Subtracting sales from the retail value of cost of goods available for sale to obtain ending inventory at retail,
  - Computing a cost-to-retail ratio that will allow inventory valuations under FIFO, average cost, LIFO, or lower of average cost or market cost flow assumptions, and
  - Applying the appropriate cost-to-retail ratio to ending inventory at retail.
- The dollar-value LIFO retail method combines the principles of the retail LIFO method with the dollar-value LIFO method
- Errors in the valuation of inventory can result in inaccurate balance sheet and income measurements that affect multiple years. Careful analysis is required to determine the effects of such errors.

## SUMMARY OF INVENTORY ISSUES

In Chapter 8 and this chapter, we discussed the inventory systems, methods, and adjustments that a company may use to account for its cost of goods sold and ending inventory. We summarize these issues in Exhibit 9-2 to help you understand their relationships.

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

1. **Understand the lower of cost or market method.** The lower of cost or market rule requires that a company write down its inventory to market value (replacement cost) when its utility has declined. The upper constraint on the market value is that the market value should not exceed the net realizable value. The lower constraint is that the market value should not be below the net realizable value reduced by an allowance for a normal profit margin. A company may apply the method to each item in inventory, to major categories, or to the inventory as a whole.

2. **Explain the conceptual issues regarding the lower of cost or market method.** The conceptual issues include the appropriateness of recognizing a loss and a reduction in the value of the inventory before a transaction occurs. Another issue is that a company only recognizes declines in value. The method also affects the amount of income a company recognizes in future periods.
3. **Understand purchase obligations and product financing arrangements.** If a company has incurred an unconditional purchase obligation at a definite price, the company discloses this commitment in a note to its financial statements. In a product financing arrangement, the company does not recognize the transfer of the inventory as a sale, but records the proceeds received as a liability.
4. **Explain the valuation of inventory above cost.** Inventory may be valued above cost only in rare circumstances, such as for precious metals and certain agricultural and mineral products.
5. **Use the gross profit method.** A company uses the gross profit method to estimate the cost of the inventory by applying a gross profit rate based on its income statements of previous periods to the net sales of the current period. It deducts the estimated gross profit from the actual net sales to determine the estimated cost of goods sold and deducts the latter amount from the cost of goods available for sale to determine the estimated ending inventory.
6. **Understand the retail inventory method.** Retail companies often use the retail inventory method in which they compute the ending inventory at cost by multiplying the ending inventory at retail by a cost-to-retail ratio. The computation of the cost-to-retail ratio varies depending on which cost flow assumption the company is using, and whether it is using the lower of cost or market method.
7. **Explain the conceptual issues regarding the retail inventory method.** The retail inventory method involves two assumptions. First, the items in inventory are assumed to be relatively homogeneous so that they have the same markup. Second, the cost-to-retail ratio is assumed to remain constant over the period. Furthermore, the lower of average cost or market retail method (the most widely used method) is accurate only if either markups and markdowns do not exist at the same time or if all the marked-down items have been sold.
8. **Understand the dollar-value LIFO retail method.** Under the dollar-value LIFO retail method, a company determines its ending inventory at retail and then converts this amount to the ending inventory at base-year retail prices by applying a base-year conversion index. It then determines the increase (decrease) in inventory at base-year retail prices and converts this amount to current-year retail prices using the appropriate conversion index. It converts the increase (decrease) to cost using the cost-to-retail ratio for the current year and then adds (subtracts) this amount to the beginning inventory at cost to determine the ending inventory at cost. The dollar-value LIFO retail method combines the advantages of the dollar-value LIFO method with those of the retail method.
9. **Understand the effects of inventory errors on the financial statements.** Errors in the valuation of inventory and the recording of purchases can result in inaccurate values on a company's balance sheet and income statement. The company must carefully examine each error to determine the appropriate correction.

## ANSWERS TO REAL REPORT QUESTIONS

### Real Report 9-1 Answer

1. While inventory is normally valued using the lower of cost or market method, ConAgra is able to value its inventory of grain, flour, and feed ingredients at market value because of their immediate marketability at quoted prices. This represents an exception to the general rule of inventory valuation and should only be used in exceptional cases.

### Real Report 9-2 Answers

1. Wal-Mart values its inventory at the lower of cost or market using the retail method. The retail inventory method requires records of beginning inventory and goods

purchased to be kept at cost (Wal-Mart uses a LIFO assumption) and retail. The retail inventory method then estimates the cost of inventory by applying a cost-to-retail ratio to the ending inventory valued at retail. To achieve a lower of cost or market valuation of the ending inventory, the cost and retail value of the beginning inventory and net markups are included in the computation of the cost-to-retail ratio (net markdowns are excluded). This method is known as the conventional retail method.

2. With inventory over \$26 billion, a physical count of inventory is a major undertaking. Wal-Mart most likely uses the retail method because this permits it to compute cost of goods sold and income without having to take a physical count of inventory.

3. Given rising inventory costs, Wal-Mart's use of the LIFO cost flow assumption will result in lower inventory values, earnings, and taxes (assuming the use of LIFO for tax purposes). However, LIFO is not generally allowed for tax purposes in foreign countries and

with these benefits removed, the advantages of a FIFO cost flow assumption (higher income and balance sheet amounts) likely outweigh any remaining benefits of using LIFO.

## QUESTIONS

**Q9-1** Define the terms *cost* and *market* as used in the lower of cost or market inventory valuation rule.

**Q9-2** Define the *upper* and *lower* constraints used in the lower of cost or market rule. What is the purpose of each constraint?

**Q9-3** How may a company apply the lower of cost or market method to its inventory?

**Q9-4** What arguments may be used against the lower of cost or market rule?

**Q9-5** Under what conditions does a company anticipate price declines?

**Q9-6** How, and under what conditions, does a company recognize a purchase obligation or a product financing arrangement in its financial statements?

**Q9-7** What are the exceptions to historical cost valuation of inventory allowed under generally accepted accounting principles? Under what conditions is each allowed?

**Q9-8** Describe four situations in which the gross profit method of estimating inventory would be useful.

**Q9-9** What is the basic assumption underlying the gross profit method? How may the gross profit percentage for the prior year be modified to provide a better estimate of the inventory value?

**Q9-10** What are the necessary conditions for the retail inventory method to provide valid results?

**Q9-11** Explain the meaning of the following terms: *markup*, *additional markup*, *markup cancellation*, *net markup*, *markdown*, *markdown cancellation*, *net markdown*.

**Q9-12** Describe how a company computes the cost-to-retail ratio for the following cost flow assumptions: FIFO, average cost, LIFO, lower of average cost or market. Why do the different methods approximate each cost flow assumption?

**Q9-13** What assumptions are necessary for the lower of cost or market retail inventory method to actually produce an inventory value equal to the lower of average cost or market?

**Q9-14** The retail inventory method indicated an inventory value of \$80,000. A physical inventory indicated a value of \$70,000. Suggest possible causes of this discrepancy.

**Q9-15** Indicate the effect of each of the following errors on a company's balance sheet and income statement of the current and succeeding years:

- The ending inventory is overstated.
- Merchandise received was not recorded in the Purchases account until the succeeding year although the item was included in inventory of the current year.
- Merchandise purchases shipped FOB shipping point were not recorded in either the Purchases account or the ending inventory.
- The ending inventory was understated as a result of the exclusion of goods sent out on consignment.

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

**M9-1** Moore Company carries product A in inventory on December 31, 2007 at its unit cost of \$7.50. Because of a sharp decline in demand for the product, the selling price was reduced to \$8.00 per unit. Moore's normal profit margin

on product A is \$1.60, disposal costs are \$1.00 per unit, and the replacement cost is \$5.30. Under the rule of cost or market, whichever is lower, Moore's December 31, 2007 inventory of product A should be valued at a unit cost of

- |           |           |
|-----------|-----------|
| a. \$5.30 | c. \$7.00 |
| b. \$5.40 | d. \$7.50 |

## EXERCISES

**E9-1 Lower of Cost or Market** The Stiles Corporation uses the lower of cost or market method for each of two products in its ending inventory. A profit margin of 30% on the selling price is considered normal for each product. Specific data for each product are as follows:

	Product A	Product B
Historical cost	\$ 68	\$ 91
Replacement cost	60	93
Estimated cost of disposal	32	52
Estimated selling price	140	200

**Required**

What is the correct inventory value for each product?

**E9-2 Lower of Cost or Market** The following information for the Tuell Company is available:

	Case				
	1	2	3	4	5
Cost	\$5.00	\$5.00	\$5.00	\$5.00	\$5.00
Net realizable value	5.10	5.50	4.80	4.20	4.70
Net realizable value less normal profit	4.80	5.30	4.70	4.00	4.60
Replacement cost	5.30	5.20	4.60	4.10	4.80

**Required**

What is the correct inventory value in each of the preceding situations?

**E9-3 Lower of Cost or Market** The following information is taken from the records of the Aden Company:

Product	Group	Units	Cost/Unit	Market/Unit
A	1	600	\$ 1.00	\$ 0.80
B	1	250	1.50	1.55
C	2	150	5.00	5.25
D	2	100	6.50	6.40
E	3	80	25.00	24.60

**Required** 

What is the correct inventory value if the company applies the lower of cost or market to each of the following?

1. Individual items
2. Groups of items
3. The inventory as a whole

**E9-4 Lower of Cost or Market** The inventories of the Berry Company for the years 2007 and 2008 are as follows:

	Cost	Market
January 1, 2007	\$10,000	\$10,000
December 31, 2007	13,000	11,500
December 31, 2008	15,000	14,000

**Required**

Prepare the necessary journal entries at the end of each year to record the correct inventory valuation. Use the allowance method and assume that a periodic inventory system is used.

**E9-5 Loss on Purchase Commitment** During 2007 the Boge Corporation signed a noncancelable contract to purchase 10,000 bushels of soybeans at \$5 per bushel with delivery to be made in 2008. On December 31, 2007, the price of soybeans had fallen to \$4.50 per bushel. On May 1, 2008, the Boge Corporation takes delivery of the soybeans when the price is \$4.75 per bushel.

**Required**

Prepare the journal entries required on December 31, 2007 and May 1, 2008.

**E9-6 Estimation of Fire Loss** On September 28, 2007 a fire destroyed the entire merchandise inventory of the Carroll Corporation. The following information is available:

Sales, January 1—September 28, 2007	\$540,000
Inventory, January 1, 2007	\$150,000
Merchandise purchases, January 1—September 28, 2007 (including \$60,000 of goods in transit on September 28, 2007, shipped FOB shipping point)	\$465,000
Markup percentage on cost	20%

**Required**

What is the estimated inventory on September 28, 2007 immediately prior to the fire?

**E9-7 AICPA Adapted Gross Profit Method** On November 21, 2007 a fire at Hodge Company's warehouse caused severe damage to its entire inventory of Product Tex. Hodge estimates that all usable damaged goods can be sold for \$10,000. The following information was available from Hodge's accounting records for Product Tex:

Inventory at November 1, 2007	\$100,000
Purchases from November 1, 2007 to date of fire	140,000
Net sales from November 1, 2007 to date of fire	220,000

Based on recent history, Hodge had a gross margin (profit) on Product Tex of 30% of net sales.

**Required**

Prepare a schedule to calculate the estimated loss on the inventory in the fire, using the gross margin (profit) method. Show supporting computations in good form.

**E9-8 Gross Profit** The following gross profit data are taken from the financial records of the Eckhardt Company:

	2007	2008
Sales	\$300,000	\$296,000
Cost of goods sold	(200,000)	(203,300)
Gross profit	<u>\$100,000</u>	<u>\$ 92,700</u>

**Required**

1. If it is known that volume declined 5% from 2007 to 2008, by how much did selling prices change?
2. If it is known that volume declined 5% from 2007 to 2008, by how much did costs change?
3. If selling prices increased 4% from 2007 to 2008, what effect would this factor alone have on gross profit?
4. If costs increased by 7% from 2007 to 2008, what effect would this factor have on gross profit?

**E9-9 Gross Profit Percentage** An accountant sometimes must convert gross profit percentages.

**Required**

1. Convert the following gross profit percentages based on net sales to gross profit as a percentage of the cost of goods sold: 20%, 25%, and 40%.
2. Convert the following gross profit percentages based on the cost of goods sold to gross profit as a percentage of net sales: 20%, 25%, and 40%.

**E9-10 Retail Inventory Method** The Harmes Company is a clothing store that uses the retail inventory method. The following information relates to its operations during 2007:

	Cost	Retail
Inventory, January 1	\$28,400	\$ 40,200
Purchases	65,200	100,000
Markups (net)	—	1,900
Markdowns (net)	—	400
Sales	—	80,000

**Required** 

Compute the ending inventory by the retail inventory method for the following cost flow assumptions:

1. FIFO
2. Average cost
3. LIFO
4. Lower of cost or market (based on average cost)

**E9-11 AICPA Adapted Retail Inventory Method** The following data were available from the records of the Hegge Department Store for the year ended December 31, 2007:

	At Cost	At Retail
Merchandise inventory, January 1, 2007:	\$ 90,000	\$130,000
Purchases	330,000	460,000
Markups	—	10,000
Markdowns	—	40,000
Sales	—	480,000

**Required**

Using the retail method, what is the estimate of the merchandise inventory at December 31, 2007 valued at the lower of cost or market?

**E9-12 Retail Inventory Method** The following information relates to the retail inventory method used by the Jeffress Company:

	Cost	Retail
Beginning inventory	\$11,160	\$18,000
Purchases	54,600	92,400
Freight-in	840	—
Net markups	—	600
Net markdowns	—	1,144
Sales	—	94,056

**Required**

Compute the ending inventory by the retail inventory method, using the following cost flow assumptions:

1. FIFO
2. Average cost
3. LIFO
4. Lower of cost or market (based on average cost)

**E9-13 Dollar-Value LIFO Retail** The Johns Company adopts the dollar-value LIFO retail inventory method on January 1, 2007. The following information for 2007 is obtained from the company's records:

	Cost	Retail
Inventory, January 1, 2007	\$20,000	\$29,000
Purchases	60,000	92,000
Net markups	—	1,000
Net markdowns	—	3,000
Sales	—	75,000

The price index on January 1, 2007 was 100 and on December 31, 2007 it was 110.

**Required**

Compute the cost of the inventory on December 31, 2007.

**E9-14 Dollar-Value LIFO Retail** The Wyatt Company adopts the dollar-value LIFO retail inventory method on January 1, 2007. The company's records reveal that the inventory on January 1, 2007 had a cost of \$75,000 and a retail value of \$120,000. During 2007 the cost of purchases made was \$110,000, and the retail value was \$165,000. In addition, net markdowns were \$6,000, net markups were \$8,000, and sales were \$147,000. The price index on January 1, 2007 was 100 and the index for 2004 was 110.

**Required**

Compute the cost of inventory on December 31, 2007. (Round the cost-to-retail index to 3 decimal places.)

**E9-15 AICPA Adapted Dollar-Value LIFO Retail** On December 31, 2006 Davison Company adopted the dollar-value LIFO retail inventory method. Inventory data for 2007 are as follows:

	LIFO Cost	Retail
Inventory, 12/31/06	\$360,000	\$500,000
Inventory, 12/31/07	?	660,000
Increase in price level for 2007		10%
Cost-to-retail ratio for 2007		70%

**Required**

Compute the cost of Davison Company's inventory at December 31, 2007.

**E9-16 Errors** A company that uses the periodic inventory system makes the following errors:

1. It omits a purchase on credit from the Purchases account and the ending inventory.
2. It omits a purchase on credit from the Purchases account, but the ending inventory is correct.
3. It overstates the ending inventory, but purchases are correct.

**Required**

Indicate the effect of the preceding errors on the income statement and the balance sheet of the current and succeeding years.

**E9-17 AICPA Adapted Errors** During the course of your examination of the financial statements of Burnett Co., a new client, for the year ended December 31, 2007, you discover the following:

Inventory at January 1, 2007 was understated by \$6,000.

Inventory at December 31, 2007 was overstated by \$5,000.

During 2007 the company received a \$1,000 cash advance from a customer for merchandise to be manufactured and shipped during 2008. It had credited the \$1,000 to sales revenue. The company's gross profit on sales is 50%. Net income reported on the 2007 income statement (before reflecting any adjustments for the above items) is \$20,000.

**Required**

What is the correct net income for 2007?

## PROBLEMS

**P9-1 Lower of Cost or Market** The Palmquist Company has five different inventory items that it values by the lower of cost or market method. The normal markup on all items is 20% of cost. The following information is obtained from the company's records:

Item	Units	Cost	Replacement Cost	Net Realizable Value
1	500	\$10.00	\$ 9.10	\$ 9.20
2	400	8.00	8.10	7.80
3	300	15.00	13.50	14.00
4	200	18.00	12.00	17.00
5	100	25.00	25.50	25.30

**Required** 

1. Compute the lower of cost or market value for each item.
2. Compute the total inventory value if the lower of cost or market is applied to (a) each individual item and (b) the inventory as a whole. Explain the reason for the difference between the two values.

**P9-2 Lower of Cost or Market** The following are the inventories for the years 2007, 2008, and 2009 for the Parry Company:

	Cost	Market
January 1, 2007	\$50,000	\$50,000
December 31, 2007	64,000	60,000
December 31, 2008	71,000	70,000
December 31, 2009	75,000	78,000

**Required**

Prepare journal entries to record the lower of cost or market for each of the following alternatives:

1. Allowance method, periodic inventory system
2. Allowance method, perpetual inventory system
3. Direct method, periodic inventory system
4. Direct method, perpetual inventory system

**P9-3 Lower of Cost or Market and Interim Financial Statements** The following values were obtained from the inventory records of the Robb Company, which has a fiscal year ending on December 31:

	Cost	Market
Inventory, January 1, 2007	\$10,000	\$10,500
Inventory, March 31, 2007	12,000	11,500

#### Required

- Under what conditions does the company ignore the decline in inventory value below cost in its interim financial statements?
- Assuming that the company records the market value, what is the journal entry to record the decline if the company uses the perpetual inventory system and the allowance method?

**P9-4 Lower of Cost or Market** The inventory records of the Frost Company for the years 2007 and 2008 reveal the cost and market of the January 1, 2007 inventory to be \$125,000. On December 31, 2007 the cost of inventory was \$130,000, while the market value was only \$128,000. The December 31, 2008 market value of inventory was \$140,000, and the cost was only \$135,000. The Frost Company uses a periodic inventory system. Purchases for 2007 were \$100,000 and for 2008 were \$110,000.

#### Required

- Prepare the journal entries at the end of 2007 and 2008 to record the lower of cost or market under the (a) allowance method, and (b) direct method.
- Prepare the cost of goods sold section of the income statement and show how the company would record the inventory on its balance sheet for 2007 and 2008 under the (a) allowance method, and (b) direct method.

**P9-5 Gross Profit** The following information relates to the activities of the Skeen Corporation for 2007:

Work in process, January 1	\$25,000	Finished goods, December 31	\$ 30,000
Work in process, December 31	40,000	Cost of production	70,000
Finished goods, January 1	37,000	Sales (net)	100,000

#### Required

What is the gross profit as a percentage of net sales?

**P9-6 Estimation of Theft Loss** You are requested by a client on September 28 to prepare an insurance claim for a theft loss which occurred on that day. You immediately take an inventory and obtain the following data:

Inventory, September 1	\$38,000	Sales, September 1–September 28	\$52,000
Purchases received, September 1–September 28	19,000	Sales returns	1,000

The inventory on September 28 indicates that an inventory of \$15,000 remains after the theft. During the past year net sales were made at 50% above the cost of goods sold.

#### Required

Compute the inventory lost during the theft.

**P9-7 Estimation of Fire Loss** On January 20, 2008 the records of the Stewart Company revealed the following information:

Inventory, July 1, 2007	\$ 53,600	Purchases discounts taken	\$5,800
Purchases, July 1, 2007–January 20, 2008	368,000	Freight-in	3,800
Sales, July 1, 2007–January 20, 2008	583,000	Sales returns	6,600
Purchases returns	11,200		

A fire destroyed the entire inventory on January 20, 2008 except for purchases in transit, FOB shipping point, of \$6,000 and goods having a selling price of \$4,700 that were salvaged from the fire. The salvaged goods had an estimated salvage value of \$2,900. The average gross profit on net sales in previous periods was 40%.

#### Required

- Compute the cost of the inventory lost in the fire.
- If a company discloses that it uses a periodic inventory system, what concerns might you have about its interim financial statements?

**P9-8 Estimation of Loss** On February 17, 2007 a flood destroyed the work in process inventory and half the raw materials inventory of the LRT Company. There was no damage to the finished goods inventory. A physical inventory taken after the flood indicated the following values:

Raw materials	\$35,000	Finished goods	\$79,000
---------------	----------	----------------	----------

A review of the accounting records indicated the following:

Inventories, December 31, 2006

Raw materials	\$70,000	Raw materials purchases	\$20,000
Work in process	80,000	Direct labor cost	30,000
Finished goods	72,000	Manufacturing overhead cost	15,000
Sales (to February 17)	50,000	Gross profit rate (on sales)	40%

### Required

Compute the value of the inventory destroyed by the flood.

**P9-9 AICPA Adapted** *Estimation of Flood Loss* On June 30, 2007 a flash flood damaged the warehouse and factory of Padway Corporation, completely destroying the work-in-process inventory. There was no damage to either the raw materials or finished goods inventories. A physical inventory taken after the flood revealed the following valuations:

Raw materials	\$ 62,000
Work in process	-0-
Finished goods	119,000

The inventory on January 1, 2007 consisted of the following:

Raw materials	\$ 30,000
Work in process	100,000
Finished goods	<u>140,000</u>
	<u>\$270,000</u>

A review of the books and records disclosed that the gross profit margin historically approximated 25% of sales. The sales for the first six months of 2007 were \$340,000. Raw material purchases were \$115,000. Direct labor costs for this period were \$80,000, and manufacturing overhead was historically applied at 50% of direct labor.

### Required

Compute the value of the work-in-process inventory lost at June 30, 2007. Show supporting computations in good form.

**P9-10 Retail Inventory Method** The Turner Corporation uses the retail inventory method. The following information relates to 2007:

	Cost	Retail		Cost	Retail
Inventory, January 1	\$ 29,000	\$ 45,000	Additional markups	—	\$ 50,000
Purchases (gross price)	140,000	190,000	Markup cancellations	—	10,000
Purchases discounts taken	3,000	—	Markdowns	—	15,000
Purchases returns	5,000	8,000	Markdown cancellations	—	3,000
Freight-in	20,000	—	Sales	—	190,000
Employee discounts	—	3,000			

### Required

Compute the cost of the ending inventory under each of the following cost flow assumptions:

1. FIFO
2. Average cost
3. LIFO
4. Lower of cost or market (based on average cost)

**P9-11 Comprehensive** The EKC Company uses the retail inventory method. The following information for 2007 is available:

	Cost	Retail		Cost	Retail
Inventory, January 1	\$100,000	\$180,000	Markdowns	—	\$ 15,000
Purchases (gross price)	320,000	600,000	Markdown cancellations	—	4,000
Purchases discounts taken	6,000	—	Sales	—	610,000
Freight-in	16,000	—	Sales returns	—	30,000
Additional markups	—	60,000	Sales discounts	—	10,000
Markup cancellations	—	12,000			

**Required**

Compute the cost of the ending inventory under each of the following cost flow assumptions:

1. FIFO
2. Average cost
3. LIFO
4. Lower of cost or market (based on average cost)

**P9-12 AICPA Adapted Retail Inventory Method** The Red Department Store uses the retail inventory method. Information relating to the computation of the inventory at December 31, 2007 is as follows:

	Cost	Retail		Cost	Retail
Inventory at January 1, 2007	\$ 32,000	\$ 80,000	Markups	—	\$60,000
Sales	—	600,000	Markup cancellations	—	10,000
Purchases	270,000	590,000	Markdowns	—	25,000
Freight-in	7,600	—	Markdown cancellations	—	5,000

Estimated normal shrinkage is 2% of sales.

**Required**

Prepare a schedule to calculate the estimated ending inventory at the lower of average cost or market at December 31, 2007, using the retail inventory method. Show supporting computations in good form.

**P9-13 Retail Inventory Method** The Weber Corporation uses the retail inventory method to estimate its inventory balances. The following information is available on June 30:

	Cost	Retail		Cost	Retail
Inventory, January 1	\$25,000	\$ 60,000	Markdowns	—	\$7,000
Purchases	75,000	180,000	Additional markups	—	3,000
Sales	—	210,000	Markdown cancellations	—	2,000
Purchases returns	2,000	5,000	Markup cancellations	—	1,000
Sales returns	—	5,000			

**Required**

1. Compute the inventory on June 30 using the “normal” retail inventory method (lower of average cost or market).
2. Independent of Requirement 1, assume that the June 30 inventory was \$80,000 at retail and that the cost-to-retail ratio is 50%. If the price level of the inventory has risen by 5% during the period, compute the cost of the June 30 inventory under the dollar-value retail LIFO method, assuming that the company adopted the method at the beginning of the year.

**P9-14 Dollar-Value LIFO Retail** The following information is obtained from the records of the Burger Company, which uses the dollar-value LIFO retail method:

	2007		2008		2009	
	Cost	Retail	Cost	Retail	Cost	Retail
Purchases	\$200,000	\$420,000	\$250,000	\$550,000	\$240,000	\$500,000
Net markups	—	20,000	—	30,000	—	10,000
Net markdowns	—	10,000	—	40,000	—	20,000
Sales	—	400,000	—	600,000	—	450,000

The company adopted LIFO on January 1, 2007, when the cost and retail values of the inventory were \$50,000 and \$100,000, respectively. The following price indexes were experienced by the Burger Company:

January 1, 2007	100	December 31, 2008	115
December 31, 2007	108	December 31, 2009	120

**Required**

Compute the cost of the ending inventory for 2007, 2008, and 2009.

**P9-15 Dollar-Value LIFO Retail** Intella, Inc. adopted the dollar-value retail LIFO method on January 1, 2006. The following data apply to the 4 subsequent years:

	Cost	Retail		Cost	Retail
2006 Inventory, January 1	\$40,000	\$ 80,000	2008 Purchases	\$117,600	\$280,000
Purchases	85,500	190,000	Sales	—	260,000
Sales	—	200,000	2009 Purchases	147,200	320,000
2007 Purchases	92,000	230,000	Sales	—	300,000
Sales	—	210,000			

In addition the following price indexes are available:

January 1, 2006	100	December 31, 2008	120
December 31, 2006	105	December 31, 2009	125
December 31, 2007	110		

**Required** 

Compute the inventory at the end of each of the 4 years.

**P9-16 Dollar-Value LIFO Retail and Fire Loss** The Golden Company adopted the dollar-value retail LIFO method on January 1, 2007. The following information relates to the following 2 years:

	2007		2008 (through September 7)	
	Cost	Retail	Cost	Retail
Inventory, January 1	\$ 40,000	\$ 90,000	Purchases	\$160,000
Purchases	100,000	210,000	Sales	—
Sales	—	200,000	Net markups	—
Net markups	—	20,000	Net markdowns	—
Net markdowns	—	40,000		70,000

In addition the following price indexes are available:

January 2007	100
December 2007	106
September 2008	110

On September 8, 2008 a fire destroyed the inventory except for goods in transit (properly recorded), FOB shipping point, at a cost of \$8,000, and undamaged goods salvaged from the fire, which had a retail value of \$10,000.

**Required**

Compute the cost of the inventory destroyed in the fire.

**P9-17 Errors** As controller of the Lerner Company, which uses a periodic inventory system, you discover the following errors in the current year:

1. Merchandise with a cost of \$17,500 was properly included in the final inventory, but the purchase was not recorded until the following year.
2. Merchandise purchases are in transit under terms of FOB shipping point. They have been excluded from the inventory, but the purchase was recorded in the current year on the receipt of the invoice of \$4,300.
3. Goods out on consignment have been excluded from inventory.
4. Merchandise purchases under terms FOB shipping point have been omitted from the Purchases account and the ending inventory. The purchases were recorded in the following year.
5. Goods held on consignment from Talbert Supply Co. were included in the inventory.

**Required**

For each error indicate the effect on the ending inventory and the net income for the current year and on the net income for the following year.

**P9-18 AICPA Adapted Comprehensive** Layne Corporation, a manufacturer of small tools, provided the following information from its accounting records for the year ended December 31, 2007:

Inventory at December 31, 2007 (based on physical count of goods in Layne's plant at cost on December 31, 2007)	\$1,750,000
Accounts payable at December 31, 2007	1,200,000
Net sales (sales less sales returns)	8,500,000

Additional information is as follows:

1. Included in the physical count were tools billed to a customer FOB shipping point on December 31, 2007. These tools had a cost of \$28,000 and had been billed at \$35,000. The shipment was on Layne's loading dock waiting to be picked up by the common carrier.
2. Goods were in transit from a vendor to Layne on December 31, 2007. The invoice cost was \$50,000, and the goods were shipped FOB shipping point on December 29, 2007.
3. Work-in-process inventory costing \$20,000 was sent to an outside processor for plating on December 30, 2007.
4. Tools returned by customers and held pending inspection in the returned goods area on December 31, 2007 were not included in the physical count. On January 8, 2008 the tools costing \$26,000 were inspected and returned to inventory. Credit memos totaling \$40,000 were issued to the customers on the same date.

5. Tools shipped to a customer FOB destination on December 24, 2007 were in transit at December 31, 2007 and had a cost of \$25,000. Upon notification of receipt by the customer on January 2, 2008, Layne issued a sales invoice for \$42,000.
6. Goods, with an invoice cost of \$30,000, received from a vendor at 5:00 p.m. on December 31, 2007, were recorded on a receiving report dated January 2, 2008. The goods were not included in the physical count, but the invoice was included in accounts payable at December 31, 2007.
7. Goods received from a vendor on December 24, 2007 were included in the physical count. However, the related \$60,000 vendor invoice was not included in accounts payable at December 31, 2007 because the accounts payable copy of the receiving report was lost.
8. On January 4, 2008, a monthly freight bill in the amount of \$4,000 was received. The bill specifically related to merchandise purchased in December 2007, one-half of which was still in the inventory at December 31, 2007. The freight charges were not included in either the inventory or in accounts payable at December 31, 2007.

**Required**

Prepare a schedule of adjustments as of December 31, 2007 to the initial amounts in inventory, accounts payable, and sales. Show separately the effect, if any, of each of the eight transactions on the December 31, 2007 amounts. Indicate if the transactions would have no effect on the initial amount shown.

**CASES**

**COMMUNICATION**

**C9-1 Retail Inventory Method**

**AICPA Adapted** The Sandberg Paint Company, your client, manufactures paint. The company's president, Ms. Sandberg, has decided to open a retail store to sell Sandberg paint as well as wallpaper and other supplies that it would purchase from other suppliers. She has asked you for information about the retail method of pricing inventories at the retail store.

**Required**

Prepare a report to the president explaining the retail method of pricing inventories. Your report should include these four points:

1. Description and accounting features of the method.
2. The conditions that may distort the results under the method.
3. A comparison of the advantages of using the retail method with those of using cost methods of inventory pricing.
4. The accounting theory underlying the treatment of net markdowns and net markups under the method.

**C9-2 Gross Profit**

**AICPA Adapted** The Shelly Corporation is an importer and wholesaler. Its merchandise is purchased from several suppliers and is warehoused by Shelly Corporation until sold to consumers.

In conducting her audit for the year ended June 30, 2007 the corporation's CPA determined that the system of internal control was good. Accordingly, she observed the physical inventory at an interim date, May 31, 2007, instead of at year-end.

The CPA obtained the following information from the general ledger:

Inventory, July 1, 2006	\$ 87,500
Physical inventory, May 31, 2007	95,000
Sales for 11 months ended May 31, 2007	840,000
Sales for year ended June 30, 2007	960,000
Purchases for 11 months ended May 31, 2007 (before audit adjustments)	675,000
Purchases for year ended June 30, 2007 (before audit adjustments)	800,000

The CPA's audit disclosed the following information:

Shipments received in May and included in the physical inventory but recorded as June purchases	\$7,500
Shipments received in unsalable condition and excluded from physical inventory; credit memos had not been received nor had chargebacks to vendors been recorded:	
Total at May 31, 2007	\$1,000
Total at June 30, 2007 (including the May unrecorded chargebacks)	\$1,500
Deposit made with vendor and charged to purchases in April 2007. Product was shipped in July 2007.	\$2,000
Deposit made with vendor and charged to purchases in May 2007. Product was shipped, FOB destination, on May 28, 2007, and was included in May 31, 2007 physical inventory as goods in transit.	\$5,500

Through the carelessness of the receiving department, a June shipment was damaged by rain. This shipment was later sold in June at its cost of \$10,000.

#### Required

In audit engagements in which interim physical inventories are observed, a frequently used auditing procedure is to test the reasonableness of the year-end inventory by the

application of gross profit ratios. Prepare in good form the following schedules:

1. Computation of the gross profit ratio for 11 months ended May 31, 2007.
2. Computation by the gross profit ratio method of cost of goods sold during June 2007.
3. Computation by the gross profit ratio method of June 30, 2007 inventory.

## CREATIVE AND CRITICAL THINKING

### C9-3 Lower of Cost or Market Method

**AICPA Adapted** Blaedon Co. makes ongoing design refinements to lawnmowers that are produced for it by contractors. Blaedon stores the lawnmowers in its own warehouse and sells them at list price, directly to retailers. Blaedon uses the FIFO inventory method. Approximately two-thirds of new lawnmower sales involve trade-ins. For each used lawnmower traded in and returned to Blaedon, retailers receive a \$40 allowance regardless of whether the trade-in was associated with a sale of a 2007 or 2008 model. Blaedon's net realizable value on a used lawnmower averages \$25.

At December 31, 2007, Blaedon's inventory of new lawnmowers includes both 2007 and 2008 models. When the 2008 model was introduced in September 2007, the list price of the remaining 2007 model lawnmowers was reduced below cost. Blaedon is experiencing rising costs.

#### Required

1. At December 31, 2007, how should Blaedon determine the carrying amounts assigned to its lawnmower inventory of
  - a. 2008 models?
  - b. 2007 models?
2. Considering only the 2008 model lawnmower, explain the impact of the FIFO cost flow assumptions on Blaedon's 2007
  - a. Income statement amounts.
  - b. Balance sheet amounts.

### C9-4 Retail Inventory Method

**AICPA Adapted** Retail, Inc., sells normal brand-name household products both from its own store and on consignment through The Mall Space Company.

#### Required

1. Explain whether Retail, Inc., should include in its inventory normal brand-name goods purchased from its suppliers but not yet received if the terms of purchase are FOB shipping point (manufacturer's plant).

2. Explain whether Retail, Inc., should include freight-in expenditures as an inventoriable cost.
3. Retail, Inc., purchased cooking utensils for sale in the ordinary course of business three times during the current year, each time at a higher price than the previous purchase. Explain the effect on ending inventory and cost of goods sold if Retail, Inc., used the weighted-average cost method instead of the FIFO method.
4. Explain how and why Retail, Inc., will treat net markdowns when it calculates the estimated cost of ending inventory using the conventional (lower of cost or market) retail inventory method.
5. Explain what products on consignment are and how they are presented on the balance sheets of Retail, Inc., and The Mall Space Company.

### C9-5 Various Inventory Issues

**AICPA Adapted** Diane Company, a retailer and wholesaler of national brand-name household lighting fixtures, purchases its inventories from various suppliers.

#### Required

1.
  - a. What criteria are used to determine which of Diane's costs are inventoriable?
  - b. Are Diane's administrative costs inventoriable? Defend your answer.
2.
  - a. Diane uses the lower of cost or market rule for its wholesale inventories. Explain the theoretical arguments for that rule.
  - b. The replacement cost of the inventories is below the net realizable value less a normal profit margin, which, in turn, is below the original cost. Explain the amount that is used to value the inventories.
3. Diane calculates the estimated cost of its ending inventories held for sale at retail using the conventional (lower of average cost or market) retail inventory method. Explain how Diane would treat the beginning inventories and net markdowns in calculating the cost ratio used to determine its ending inventories.

### C9-6 LCM, Dollar-Value LIFO, and Consignments

**AICPA Adapted** Caddell Company, a wholesaler, purchases its inventories from various suppliers FOB destination; it incurs substantial warehousing costs. Caddell uses the dollar-value LIFO inventory cost flow method. Caddell also consigns some of its inventories to Reed Company.

Reed also has items for sale that it purchases from other wholesalers. Reed uses the lower of FIFO cost or market inventory method.

#### Required

- When are the purchases from various suppliers generally included in Caddell's inventory? Why?
- Theoretically, how should Caddell account for the warehousing costs? Why?
- Explain the advantages of using the dollar-value LIFO inventory cost flow method as opposed to the conventional quantity of goods LIFO method.
  - How does the calculation of dollar-value LIFO differ from the conventional quantity of goods method?
- Explain how Caddell should account for the inventories consigned to Reed Company.
- When Reed applies the lower of cost or market method, what are the ceiling and floor limits?

### C9-7 Inventory Valuation Issues

**AICPA Adapted** Hanlon Company purchased a significant amount of raw materials inventory for a new product that it is manufacturing. Hanlon purchased insurance on these raw materials while they were in transit from the supplier.

Hanlon uses the lower of cost or market rule for these raw materials. The replacement cost of the raw materials is above the net realizable value and both are below the original cost.

Hanlon uses the average cost inventory method for these raw materials. In the last two years, each purchase has been at a lower price than the previous purchase, and the ending inventory quantity for each period has been higher than the beginning inventory quantity for that period.

#### Required

- Explain the theoretically appropriate method that Hanlon should use to account for the insurance costs on the raw materials while they were in transit from the supplier.
- Explain the amount at which Hanlon should report the raw materials inventory on its balance sheet.
  - In general, explain why the lower of cost or market rule is used to report inventory.
- Explain what would have been the effect on ending inventory and cost of goods sold had Hanlon used the LIFO inventory method instead of the average cost inventory method for the raw materials.

### C9-8 Various Inventory Issues

**AICPA Adapted** Hudson Company, which is both a wholesaler and a retailer, purchases its inventories from various suppliers. Additional facts for Hudson's wholesale operations are as follows:

- Hudson incurs substantial warehousing costs.
- Hudson uses the lower of cost or market method.
- The replacement cost of the inventories is below the net realizable value and above the net realizable value less the normal profit margin. The original cost of the inventories is above the replacement cost and below the net realizable value.

Additional facts for Hudson's retail operations are as follows:

- Hudson determines the estimated cost of its ending inventories held for sale at retail using the conventional retail inventory method, which approximates lower of average cost or market.
- Hudson incurs substantial freight-in costs.
- Hudson has net markups and net markdowns.

#### Required

- Theoretically, how should Hudson account for the warehousing costs related to its wholesale inventories? Why?
- In general, explain why the lower of cost or market method is used to report inventory.
  - At which amount should Hudson report the wholesale inventories on its balance sheet? Explain the application of the lower of cost or market method in this situation.
- In the calculation of the cost-to-retail percentage used to determine the estimated cost of its ending retail inventories, how should Hudson treat
  - Freight-in costs?
  - Net markups?
  - Net markdowns?
- Explain why Hudson's retail inventory method approximates lower of average cost or market.

### C9-9 Ethics and Retail Inventory

You are the accountant for the South-Western Division of HiValue Grocery Stores. Late in December, Kelly Cholak, the CEO of the Division stops by your office and says "I have a couple of questions. I recently received a report from the head office on the first 11 months of the year. We are not doing as well as we budgeted and they are not happy with the gross profit we have earned. But the good news is that I just got off the phone with a big supplier who has excess inventory and could sell us enough of their products to last us three months. They have offered us a great price—lower than we have paid in a couple of years. Then I remembered that you use that funny LIFO retail inventory method where you play

with such confusing numbers. Will the purchase reduce our retail ratio, or whatever you call it, so that our inventory is lower and cost of goods sold higher, because that would only make us look worse? Alternatively, I thought that we could delay this purchase until after January 1 and we might be able to have one of those LIFO liquid profits and make

ourselves look good for the year's results. Give these issues some thought and let's have a drink after work today to discuss them."

**Required**

From financial reporting and ethical perspectives, how would you reply to Kelly?

## 10

## OBJECTIVES

After reading this chapter, you will be able to:

- 1 Identify the characteristics of property, plant, and equipment.
- 2 Record the acquisition of property, plant, and equipment.
- 3 Determine the cost of a nonmonetary asset acquired by the exchange of another nonmonetary asset.
- 4 Compute the cost of a self-constructed asset, including interest capitalization.
- 5 Record costs after acquisition.
- 6 Record the disposal of property, plant, and equipment.
- 7 Understand the disclosures of property, plant, and equipment.
- 8 Explain the accounting for oil and gas properties (Appendix).

## Property, Plant, and Equipment: Acquisition and Disposal

### To Capitalize or Not to Capitalize, That is the Question

The issue of capitalizing (recording as an asset) versus expensing expenditures for property, plant, and equipment has historically been controversial and one that can have dramatic consequences for the balance sheet, income statement, and statement of cash flows. It was precisely this issue that triggered one of the largest financial restatements in U.S. history by **WorldCom**. According to U.S. accounting standards, line costs, the various fees paid to telecommunications companies to use their communication networks, are considered expenses. By improperly capitalizing approximately \$3.8 billion in line costs, WorldCom was able to conceal large losses and falsely portray itself as a profitable business. In addition, the expenditures for line costs were treated as investing cash flows instead of operating cash flows, which resulted in WorldCom reporting higher net operating cash flows than if the costs were expensed. While the practices used by WorldCom were clear violations of GAAP, in many situations (e.g., oil and gas exploration) managers have choices and must use their judgment as to whether certain expenditures are capitalized or expensed.

Credit: Adam Rountree/Bloomberg News/Landov

What are the financial impacts of these choices? First, companies that choose to capitalize rather than expense costs will report higher asset and equity balances, which tend to make them appear more solvent (lower debt ratios). Second, capitalizing costs will raise current-year income by the amount capitalized; however, future income will be lowered by the amount of the depreciation expense. While the income effect on any single year depends on the actual size of the expenditures, the pattern of reported income will tend to be smoother for firms that capitalize costs because of the systematic allocation of costs through the recording of depreciation. When faced with the question of capitalizing or expensing certain costs, it is crucial to understand the financial statement impacts of your decision.

### FOR FURTHER INVESTIGATION

For a discussion of capitalizing expenditures, consult the Business & Company Resource Center (BCRC):

- Accounting Practice On Trial with WorldCom: Should Cable Companies be Able to Capitalize Expenses? *Investment Dealers' Digest*, 0021-0080, Oct 13, 2003.

Property, plant, and equipment are very important components of a company's assets. They include assets that a company needs to conduct its business, such as land, office buildings, factories, machinery, equipment, warehouses, retail stores, and delivery vehicles. They usually are a major portion of a company's total assets. In this chapter we include a discussion of the costs of acquisition, costs subsequent to acquisition, and disposal of property, plant, and equipment. We include additional issues related to oil and gas properties in an Appendix at the end of this chapter.

## CHARACTERISTICS OF PROPERTY, PLANT, AND EQUIPMENT

1 Identify the characteristics of property, plant, and equipment.

Property, plant, and equipment are the **tangible noncurrent assets that a company uses in the normal operations of its business**. Alternative terms are **plant assets, fixed assets, and operational assets**. To be included in this category, an asset must have three characteristics:

1. *The asset must be held for use and not for investment.* Only assets used in the normal course of business should be included. However, the asset does not have to be used continuously. Therefore, a company includes machinery it owns for standby purposes in case of breakdowns. However, it does not include idle land or buildings; these should be reported as investments. A particular type of asset may be classified as property, plant, and equipment by one company and as inventory by another. For example, trucks owned by a trucking company are included in its property, plant, and equipment. However, trucks owned by a dealer are categorized as inventory.
2. *The asset must have an expected life of more than one year.* The asset represents a bundle of future services that the company will receive over the life of the asset. To be included in property, plant, and equipment, the benefits must extend for more than one year or the normal operating cycle, whichever is longer. Therefore, a company distinguishes the asset from other assets, such as supplies, that it expects to consume within the current year. However, assets remain in the property, plant, and equipment category, even if the company intends to sell them in the next year.
3. *The asset must be tangible in nature.* There must be a physical substance that can be seen and touched. In contrast, intangible assets such as goodwill or patents do not have a physical substance. Unlike raw materials, generally property, plant, and equipment do not change their physical characteristics and are not added into the product. Wasting assets are natural resources, such as minerals, oil and gas, and timber, that are used up by extraction. A company usually includes them under the category of property, plant, and equipment, even though it may add them in a product. For example, an iron mine owned by a steel company produces iron ore, which changes its characteristics as it is used in the manufacture of steel.

A company initially records an asset included in its property, plant, and equipment category at its acquisition cost. The asset provides benefits to the company over a period of more than one year. Therefore, the matching principle requires that the company allocate the cost of the asset as an expense to each period in which it consumes the asset and receives benefits. We discuss this process of depreciation in the next chapter.

### Evaluation of Use of Historical Cost

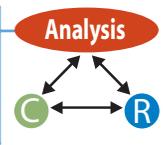

The use of acquisition (historical) cost as the basis for reporting property, plant, and equipment is consistent with the reporting of most other assets, liabilities, and stockholders' equity items. The advantages are that

1. the cost is equal to the fair value at the date of acquisition,
2. the cost is a *reliable* valuation, and
3. gains and losses from holding the asset are recognized only when realized through a sale transaction.

However, the use of historical cost for reporting property, plant, and equipment on a company's financial statements raises more issues than for other assets because the time since acquisition is usually greater. For example, many users question the continued use of historical cost for reporting an asset such as land. How *relevant* is the cost of land purchased in the past, perhaps as much as 50 years ago? Similar issues arise with depreciable assets such as office buildings. Although depreciation is a process of cost allocation rather than of valuation, the book value of the assets (cost less accumulated depreciation) may become less relevant as it becomes much less than the asset's current value. In addition, as we discuss in the next chapter, a company writes down property, plant, and equipment to its fair value when its value is impaired.

Another factor to be considered is the manner in which a company uses the asset. The process of allocating the historical cost may be more relevant if the company uses the asset in its productive operations, because there is an appropriate matching of the cost of the asset against the revenues it produces. Alternatively, the current value may be more relevant if the company intends to sell the asset, or the entire company is for sale.

Since generally accepted accounting principles require that a company report its property, plant, and equipment at historical cost, their current cost generally is not available to users of financial statements. However, companies are encouraged to provide supplementary disclosures of the current cost of their property, plant, and equipment.

## ACQUISITION OF PROPERTY, PLANT, AND EQUIPMENT

The major types of assets that a company includes in the category of property, plant, and equipment are land, buildings, equipment, machinery, furniture and fixtures, leasehold improvements, and wasting assets. The acquisition of an item of property, plant, and equipment raises many issues. These include the determination of the cost of an asset acquired singly or by a lump-sum purchase, with deferred payments, through the issuance of securities, or by donation. Also, in more complex situations, assets may be acquired in exchange for other assets or by self-construction. We discuss each of these issues in the following sections.

- 2 Record the acquisition of property, plant, and equipment.

### Determination of Cost

The cost of property, plant, and equipment is the cash outlay (not the "list" price) or its equivalent that is necessary to acquire the asset and put it in operating condition. In other words, **the acquisition costs that are necessary to obtain the benefits to be derived from the asset are capitalized** (recorded as an asset). These costs include the contract price, less discounts available, plus freight, assembly, installation, and testing costs. As for inventory, discounts *available* should be subtracted from the cost of the asset rather than recorded as discounts *taken*, because the benefits to be received from the asset are not increased by a discount not taken.

#### Example: Recording the Acquisition

Assume that the Devon Company purchases a machine with a contract price of \$100,000 on terms of 2/10, n/30. The company does not take the cash discount of \$2,000, and incurs transportation costs of \$2,500, as well as installation and testing costs of \$3,000. Sales tax is 7% of the invoice price, or \$7,000. During the installation of the machine, uninsured damages of \$500 are incurred and paid by the company. The company makes the following summary journal entry to record these costs:

Machine	(\$100,000 - \$2,000 + \$2,500 + \$3,000 + \$7,000)	110,500	
Repair Expense		500	
Discounts Lost		2,000	
Cash			113,000

The company does not include the \$500 of damages in the cost of the asset because it was not a “necessary” cost. We discuss the issues related to the cost of various types of property, plant, and equipment in the following sections. ♦

## Land

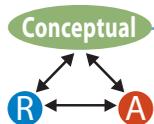

The recorded cost of land includes the:

- contract price
- costs of closing the transaction and obtaining title, including commissions, options, legal fees, title search, insurance, and past due taxes
- costs of surveys
- costs of preparing the land for its particular use, such as clearing, grading, and razing old buildings (net of any proceeds from salvage) when such improvements have an indefinite life

A company should record the costs of improvements with a limited economic life, such as landscaping, streets, sidewalks, and sewers, in a Land Improvements account and depreciate these costs over their economic lives. Alternatively, if the local government authority is responsible for the continued upkeep of the improvements, then effectively the improvements have an indefinite economic life to the company. In this case, the company should add the costs of the improvements to the cost of the land. Since land is considered *not* to have a limited economic life and its residual value is unlikely to be less than its acquisition cost, land generally is not depreciated.

Land purchased for future use or as an investment should not be considered part of property, plant, and equipment. Issues arise about accounting for interest and property taxes on such land. **FASB Statement No. 34** (discussed later in the chapter) requires that a company capitalize interest only when an asset is undergoing the activities needed to get it ready for its intended use. Therefore, if the company is involved in any planning activity, such as architectural design or the obtaining of permits, it capitalizes interest. The *Statement* does not address the issue of property taxes (or other costs such as insurance).

**FASB Statement No. 67** applies to real estate held for sale or rental. It requires a company to capitalize the costs incurred for property taxes and insurance only during periods in which activities needed to get the property ready for its intended use are in progress. Costs incurred for these items after the property is substantially complete and ready for its intended use are expensed as incurred.<sup>1</sup> Thus the rules for interest, property taxes, and insurance are the same for real estate projects developed for sale or lease to others. However, the *Statement* does not apply to real estate developed by a company for use in its own operations. Therefore, the company could capitalize or expense the property taxes and insurance during the development period.

Arguments in favor of capitalizing property taxes are (1) the matching principle does not require expensing the costs since the asset is not being used in a revenue-producing activity, and (2) if the advance purchase of the land had been made at a lower price, capitalizing the costs would result in a cost nearer to that which the company would have paid later. Arguments in favor of expensing the property taxes are (1) property taxes are a maintenance cost that do not add value to the property, and (2) it is consistent with the conservatism convention. Once the land is used in the operating activities, both interest and property taxes must be expensed.

## Buildings

The recorded cost of buildings includes:

- the contract price
- the costs of remodeling and reconditioning

1. “Accounting for Costs and Initial Rental Operations of Real Estate Projects,” *FASB Statement of Financial Accounting Standards No. 67* (Stamford, Conn.: FASB, 1982), par. 6.

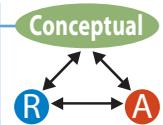

- the costs of excavation for the specific building
- architectural costs and the costs of building permits
- capitalized interest costs in the particular circumstances discussed later in the chapter
- unanticipated costs resulting from the condition of the land (such as blasting rock or channeling an underground stream)

A company should expense unanticipated costs, such as a strike or a fire, associated with the construction of the building. The different treatment is justified because the avoidable costs of the unanticipated events were not necessary to obtain the economic benefits of the building. The costs of property taxes and insurance during construction may be capitalized or expensed, as we discussed for land.

### Leasehold Improvements

Improvements made by the lessee to leased property, unless specifically exempted in the lease agreement, revert to the lessor at the end of the lease. Therefore, **a lessee capitalizes the cost of a leasehold improvement**, such as the interior design of a retail store, **and amortizes the cost over its economic life or the life of the lease, whichever is shorter.**

The preceding discussion indicates the general rules to be followed but does not provide solutions for all possible situations. A company's decision to expense a cost immediately, to capitalize it as an asset, such as a building that will be depreciated, or to capitalize the cost as a nondepreciable asset, such as land, has an impact on both the company's income statement and balance sheet. **The general procedure is to determine whether incurring the cost will provide economic benefits for the company beyond the current period, and which asset is associated with the increase in benefits.** For example, when a company purchases land, the cost of demolishing an old building on the land is properly capitalized to the land because the benefits to be derived from the land are increased as a result of the old building no longer being there. Also, if the seller had demolished the old building, the selling price presumably would have been higher. When a company demolishes an old building on land already owned so that a new building can be erected, the cost is associated with the benefits previously realized from the old building. Therefore, the cost is included in the calculation of the gain or loss on disposal. The new building does not have greater benefits because the old building is obsolete. Similarly if a company purchases an old building with the expectation of incurring some costs of renovation, but the actual costs exceed the planned costs because of unforeseen difficulties, the added cost should not be capitalized. This is because it resulted from an error of judgment and did not increase the economic benefits of the building above those benefits originally expected. However, given the difficulties of accurate budgeting, the total costs often are capitalized whether or not those total costs exceed the budgeted amount.

### Lump-Sum Purchase

A company may acquire several dissimilar assets for a single lump-sum purchase price. The purchase price is allocated to the individual assets purchased. This allocation is necessary because some of the assets may be depreciable and some not, and the depreciable assets may have different economic lives and be depreciated by different methods. **A company allocates the acquisition price in a lump-sum purchase based on the relative fair values of the individual assets.**

#### Example: Lump Sum Purchase

Suppose Sample Company pays \$120,000 for land and a building. If there is no evidence in the contract of separate prices agreed upon for the land and the building, the company allocates the \$120,000 between the two assets based on their relative fair values. The company can obtain evidence of such values from several sources, such as an appraisal or the assessed values for property taxes, if it considers those values to be reasonably

accurate indications of relative market values. Suppose that an appraisal of the land and building indicates values of \$50,000 and \$75,000, respectively. Sample Company computes the cost of each as follows:

	Appraisal Value	Relative Fair Value	×	Total Cost	=	Allocated Cost
Land	\$ 50,000	\$50,000/\$125,000	×	\$120,000	=	\$ 48,000
Building	75,000	\$75,000/\$125,000	×	\$120,000	=	72,000
Total	<u>\$125,000</u>					<u>\$120,000</u>

Sample Company records the land at a cost of \$48,000 and the building at a cost of \$72,000. If the cost of obtaining an appraisal is material, the company should add it to the purchase price so it is allocated to the respective assets. In some situations, it may be possible to determine only one of the market values. Then the remaining portion of the total cost is assigned to the other asset. ♦

### Deferred Payments

When a company acquires property, plant, and equipment on a deferred payment basis, such as by issuing notes or bonds or assuming a mortgage, it records the asset at its fair value or the fair value of the liability on the date of the transaction, whichever is more reliable. If neither is determinable, the company records the asset at the present value of the deferred payments at the stated interest rate, unless the stated rate is materially different from the market rate, in which case it uses the market rate.<sup>2</sup>

#### Example: Deferred Payments

Suppose that Antush company purchases equipment by issuing a \$10,000 non-interest-bearing five-year note, when the market rate for obligations of this type is 12%. The note will be paid off at the rate of \$2,000 at the end of each year. Neither the fair value of the equipment nor the note is determinable directly. In this case the company values both the equipment and the note at the present value of the payments, which is \$7,210 (\$2,000 × 3.604776, the factor from Table 4 of the Time Value of Money Module for five years and a 12% rate). Antush Company records the acquisition of the equipment as follows:

Equipment	7,210	
Discount on Notes Payable	2,790	
Notes Payable		10,000

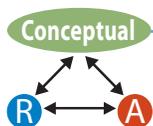

If the company purchased the equipment by issuing a \$7,500 5-year note with a stated interest rate of 12%, the present value of the note is \$7,500 (assuming that 12% is a fair rate). In this case, Antush Company would record the acquisition as follows:

Equipment	7,500	
Notes Payable		7,500

Property, plant, and equipment may be purchased by issuing bonds, as we discuss in Chapter 14. The same principles are followed, and the asset is recorded at the present value of the future payments. ♦

### Issuance of Securities

When a company acquires assets by issuing securities such as common stock or preferred stock, the company must determine the fair value of the transaction. In many cases two measures of fair value are available: the fair value of the asset acquired and the fair value of the securities issued. The general rule is to record the exchange at the fair value of

2. "Interest on Receivables and Payables," APB Opinion No. 21 (New York: AICPA, 1971), par. 11.

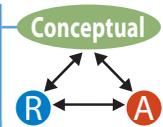

the asset acquired or of the stock issued, whichever is more *reliable*. Normally the two values would be very similar, but if they are materially different, it is necessary to select one. In some situations, one of the values may be considered more reliable because it is quoted in an active market. For example, if the security is actively traded on a stock exchange and the asset being acquired is very specialized, the security value would be the preferred choice. Alternatively, if the security is not actively traded but the asset is one that is commonly traded, the asset value would be the better choice. But what if neither of the two values can be readily determined?

For example, suppose that a company whose stock is not traded publicly issues stock to acquire a mining claim. Conceptually, the value of the asset is preferred to the value of the stock, because the value of the acquired asset is independent of the value of the stock. However, the value of the stock is *not* independent of the asset being acquired, because the more valuable the asset is, the more valuable is the stock. In the absence of any other valuation approach, the directors of the company assign a value on the transaction. State laws generally allow this procedure, provided the value is established in good faith.

### Assets Acquired by Donation

When a company acquires property, plant, and equipment through donation (usually by a governmental unit or an individual), a strict interpretation of the cost concept would require that the asset be valued at zero. However, these transactions are defined by APB Opinion No. 29 as nonreciprocal transfers of nonmonetary assets. A **nonreciprocal transfer** is a transfer of assets or services in one direction. A company receiving an asset in such an exchange must record it at its fair value. The justification is that when an asset is donated, cost provides an inadequate method of accounting for the asset and for income measurement. Therefore, the cost principle is modified to produce more relevant asset and income values.

Generally accepted accounting principles require different treatment for recording an asset donated by a governmental unit and an asset donated by a nongovernmental unit (such as an individual stockholder). In both situations, the company records (debits) the asset at its fair value. In the case of a donation by a governmental unit, the credit is recorded in a donated capital account. The argument for this treatment is that the company should not increase earnings as a result of a donation by a governmental unit.

#### Example: Donation by Governmental Unit

Suppose the city of Julesberg (a governmental unit) donates land worth \$20,000 to the Klemme Company because the company relocates its production facilities to Julesberg. The Klemme Company records this event as follows:

<b>Land</b>	<b>20,000</b>	
<b>Donated Capital</b>		<b>20,000</b>

Donations of this type often are accompanied by conditions. For example, the Klemme Company might be required to employ 100 people for 10 years. The company reports the condition in the notes to the financial statements, if material, but does not record it as a liability. Klemme Company includes the Donated Capital account in the Stockholders' Equity section of its balance sheet. ♦

#### Example: Donation by Nongovernmental Agency

In the case of a donation by a nongovernmental unit, the company records a gain.<sup>3</sup> The argument for this treatment is that receiving something of value from a nongovernmental unit (e.g., a stockholder) represents earnings to the company. For example, suppose

3. "Accounting for Contributions Received and Contributions Made," *FASB Statement of Financial Accounting Standards No. 116* (Norwalk, Conn.: FASB, 1993), par. 8.

the CEO of Hrouda Company donates a building worth \$50,000 to the company. The company records this event as follows:

<b>Building</b>	<b>50,000</b>	
<b>Gain on Receipt of Donated Building</b>		<b>50,000</b>

The company reports the gain in the other items section of its income statement. ♦

### Start-up Costs

Many companies incur start-up costs as they expand their activities. For example, a retail company that opens a new store would incur start-up costs for hiring and training new employees and pre-opening advertising. Other examples are costs of opening new restaurants, new plants, new hotels, new casinos, and new golf courses.

**AICPA Statement of Position No. 98-5** requires that a company expense the costs of start-up activities as incurred.<sup>4</sup> The *SOP* defines start-up costs as those costs related to one-time activities for opening a new facility, introducing a new product or service, conducting business in a new territory, conducting business with a new class of customer, initiating a new process in an existing facility, or starting some new operation. Costs associated with organizing a new entity, often referred to as organization costs, (e.g., costs of preparing a charter, bylaws, minutes of organizational meetings, and original stock certifications) are also included as start-up costs. Start-up activities do *not* include activities that are related to routine, ongoing efforts to refine or otherwise improve the qualities of an existing product, service, process or facility.

## LINK TO INTERNATIONAL DIFFERENCES

The primary difference between U.S. and international accounting standards is that international standards allow a company to write the value of its property, plant, and equipment assets up to fair value if fair value can be reliably measured. Any increase is credited to stockholders' equity as a revaluation surplus. Such write-ups create significant differences that reduce international comparability among companies. There are some other minor differences between U.S. and international accounting standards that are beyond the scope of the book.

## NONMONETARY ASSET EXCHANGES

Accounting for assets acquired by the exchange of other assets (e.g., trade-in, swap) is covered by **APB Opinion No. 29** and **FASB Statement No. 153**.<sup>5</sup> A **nonmonetary exchange** is a reciprocal transfer between a company and another entity, in which the company acquires nonmonetary assets or services by surrendering other nonmonetary assets or services. (A nonmonetary transaction may also include paying or incurring liabilities.) **The general principle is that the cost of a nonmonetary asset acquired in exchange for another nonmonetary asset is the fair value of the asset surrendered.** The company acquiring the asset recognizes a gain or loss on the exchange as the difference between the fair value of the asset surrendered and its book value. When a small

- 3** Determine the cost of a nonmonetary asset acquired by the exchange of another nonmonetary asset.

4. "Reporting on the Costs of Start-up Activities," *AICPA Statement of Position No 98-5* (New York: AICPA, 1998).  
 5. "Accounting for Nonmonetary Transactions," *APB Opinion No. 29* (New York: AICPA, 1973), and "Exchanges of Nonmonetary Assets, an amendment of APB Opinion No. 29," *FASB Statement No. 153* (Norwalk, Conn.: FASB, 2004).

amount of cash is also given or received, the cost of the asset acquired and the gain or loss on the nonmonetary asset surrendered is determined by these equations:

$$\text{Cost of Asset Acquired} = \frac{\text{Fair Value of Asset Surrendered}}{\text{Asset Surrendered}} + \text{Cash Paid or} - \text{Cash Received}$$

and

$$\text{Gain (Loss)} = \frac{\text{Fair Value of Asset Surrendered}}{\text{Asset Surrendered}} - \text{Book Value of Asset Surrendered}$$

If the fair value of the asset received is more reliable than the fair value of the asset surrendered, it is used to measure the cost of the asset acquired. Of course, the recorded cost of the asset acquired cannot be greater than its fair value.

### Example: Exchanges of Nonmonetary Assets

We show an exchange of nonmonetary assets between Arnold Company and Carbon Company, both with and without cash included in the exchange, in Example 10-1. Arnold Company exchanges a building for Carbon Company's equipment. Before studying the example, it is helpful to refer back to the equations for nonmonetary asset exchanges.

<b>EXAMPLE 10-1 Exchange of Nonmonetary Assets</b>				
<b>(a) No Cash Included in Exchange</b>				
	<b>Arnold Company (Building)</b>	<b>Carbon Company (Equipment)</b>		
Cost of asset surrendered	\$100,000	\$60,000		
Accumulated depreciation	54,000	32,000		
Fair value of asset surrendered	40,000	40,000		
	<b>Arnold Company</b>		<b>Carbon Company</b>	
Equipment	40,000	Building	40,000	
Accumulated Depreciation	54,000	Accumulated Depreciation	32,000	
Loss [\$40,000 – (\$100,000 – \$54,000)]	6,000	Equipment		60,000
Building	100,000	Gain [\$40,000 – (\$60,000 – \$32,000)]		12,000
<b>(b) Cash Included in Exchange</b>				
	<b>Arnold Company (Building)</b>	<b>Carbon Company (Equipment)</b>		
Cost of asset surrendered	\$100,000	\$60,000		
Accumulated depreciation	54,000	32,000		
Fair value of asset surrendered	40,000	35,000		
Cash received (paid)	5,000	(5,000)		
	<b>Arnold Company</b>		<b>Carbon Company</b>	
Equipment		Building		
(\$40,000 – \$5,000)	35,000	(\$35,000 + \$5,000)	40,000	
Accumulated Depreciation	54,000	Accumulated Depreciation	32,000	
Cash	5,000	Equipment		60,000
Loss [\$40,000 – (\$100,000 – \$54,000)]	6,000	Cash		5,000
Building	100,000	Gain [\$35,000 – (\$60,000 – \$32,000)]		7,000

In example (a), there is no cash exchanged. Each company gives up and receives an asset with a fair value of \$40,000, which is, therefore, the fair value of the transaction. Since Arnold Company gives up a building with a fair value of \$40,000 and a book value of \$46,000 (the cost of \$100,000 less the accumulated depreciation of \$54,000), it recognizes a loss of \$6,000 (\$40,000 – \$46,000). It also records the cost of the acquired equipment at the fair value of \$40,000. Carbon Company gives up equipment with a fair value of \$40,000 and a book value of \$28,000 (\$60,000 – \$32,000). Therefore, it recognizes a gain of \$12,000 (\$40,000 – \$28,000) and records the cost of the building acquired at the fair value of \$40,000.

In example (b), Arnold Company receives cash of \$5,000. Since Arnold Company gives up a building with a fair value of \$40,000 and a book value of \$46,000, it recognizes a loss of \$6,000. It records the acquired equipment at a cost of \$35,000 (the \$40,000 fair value of the building surrendered minus the \$5,000 cash received). Carbon Company gives up equipment with a fair value of \$35,000 and a book value of \$28,000. Therefore, it records a gain of \$7,000 and the acquired building at a cost of \$40,000 (the \$35,000 fair value of the equipment surrendered plus the \$5,000 cash paid). ♦

### Exceptions to the General Rule to Use Fair Value for Nonmonetary Exchanges

FASB Statement No. 153 was issued to make U.S. GAAP more similar to international GAAP. Therefore, it made three exceptions to the general rule to use fair value that we discussed earlier. A company would record the nonmonetary exchange transaction at book value and would not recognize a gain or loss when:

1. Neither the fair value of the asset received or given up is reasonably determinable.
2. The transaction is an exchange of inventory to facilitate sales to a third party. For example, when a company exchanges its inventory with another company in order to sell the newly acquired inventory to a third company.
3. The transaction lacks “commercial substance.” A nonmonetary exchange does *not* have commercial substance if the company’s future cash flows are *not* expected to change significantly.

For example, assume that the Messenger Company owned a truck with a cost \$50,000 and accumulated depreciation of \$20,000. The company exchanged the truck for a used truck from Leninger Company and paid \$2,000. Since the trucks were so similar, the Messenger Company’s cash flows are not expected to change significantly as a result of this exchange. Messenger would record the truck it received at \$32,000, which is the book value of the truck it gave up of \$30,000 (\$50,000 – \$20,000) plus the \$2,000 cash it paid. Messenger would record the exchange as follows:

<b>Truck</b>	<b>32,000</b>	
<b>Accumulated Depreciation</b>	<b>30,000</b>	
<b>Truck</b>		<b>50,000</b>
<b>Cash</b>		<b>2,000</b>

### SECURE YOUR KNOWLEDGE 10-1

- Property, plant, and equipment is reported in the financial statements at historical cost, and includes tangible assets with expected lives of greater than one year that a company uses in the normal course of business to generate revenue.
- The initial cost of the various types of property, plant, and equipment includes all the costs necessary to acquire the asset, bring it to its desired location, and get it ready for its intended use.

(continued)

- The initial valuation of property, plant, and equipment is often complicated by the manner in which the asset is acquired. In these situations, the acquisition cost is generally based on fair value, as noted below:
  - When more than one asset is acquired for a single lump-sum purchase price, the purchase price is allocated to the individual assets based on their relative fair values.
  - Assets acquired on a deferred payment basis (long-term credit contract) are recorded at the fair value of the asset or the fair value of the liability, whichever can be more clearly determined.
  - Assets acquired through the exchange of stock are recorded at the fair value of the asset or the fair value of the stock, whichever can be more clearly determined.
  - Donated assets are recorded at fair value with a corresponding increase in either an equity account (if the donation was made by a governmental entity) or a gain (if the donation was made by a nongovernmental entity).
  - In general, exchanges of nonmonetary assets should be recorded at fair value, with any gains or losses recognized in income.

## LINK TO ETHICAL DILEMMA

As the accountant for Magna Corporation, you have been carefully analyzing a nonmonetary exchange of assets that occurred in the current fiscal year. Toward the end of the third quarter, Magna obtained 10 used Ford delivery trucks by exchanging 10 of its own General Motors delivery trucks. Because the fair value of Magna's trucks exceeded their book value, Magna was able to recognize a gain on the transaction. The Ford trucks obtained in the exchange had the same cargo capacity as the General Motors trucks and approximately the same amount of miles on the odometer. In fact, as far as you can tell, other than the manufacturer's names, the trucks were virtually identical! In discussions with management, you determine that, prior to the exchange, third-quarter earnings were slightly lower than analyst expectations, and the exchange appears to be prompted by a desire to record a gain that would increase earnings to meet the earnings forecast. As support for the decision to enter into the exchange, management offers a brief memo stating that the new trucks are expected to generate significantly more cash flow than the trucks given up. Therefore, the exchange has commercial substance and GAAP requires the exchange to be recorded at fair value. What is your response?

## SELF-CONSTRUCTION

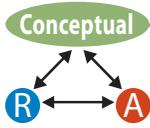

Sometimes a company constructs an item of property, plant, and equipment that it intends to use in its production process. The costs directly related to the construction are added to the cost of the asset, including materials, labor, engineering, and variable manufacturing overhead. Three other components of the asset cost need additional consideration: (1) interest costs, (2) fixed manufacturing overhead costs, and (3) profit on the construction. We discuss each of these in the following sections.

### Interest During Construction

There has been a great deal of controversy as to whether a company should capitalize the interest on the funds borrowed to finance construction of an asset as part of the acquisition cost, or expense the interest. Also, if the company uses internally generated funds to finance the acquisition, should it add imputed interest to the cost of the asset? Regulating authorities for public utilities usually allow a company to

- 4 Compute the cost of a self-constructed asset, including interest capitalization.

include both actual and imputed interest in the cost of the asset because the impact of the interest on the utility rates is deferred until the new plant is in operation. Therefore, the company assigns the cost of the plant (through depreciation expense) to the periods of use and to the customers who use the product. **FASB Statement No. 34** requires the capitalization of interest in certain instances as we discuss later in this section.<sup>6</sup>

### Conceptual Alternatives

The *Statement* discussed three alternatives that the FASB considered to account for interest during construction.

- (a) ***No interest is capitalized during construction.*** Under this alternative a company would treat interest as a cost of borrowing funds, and would record the interest as an expense during the period incurred. This approach would be consistent with all other interest costs, such as interest on cash borrowed to purchase inventory, or to purchase property, plant, and equipment. The principal argument in favor of this alternative is that interest is the price paid for borrowing funds for a period of time, and the benefit received is the availability of the funds. Therefore, the matching principle requires that the cost be expensed against the company's revenues in the period in which the funds are made available. Another argument is that expensing interest as incurred results in income amounts that are more similar to cash flows.
- (b) ***Capitalize an amount of interest for all funds used for construction.*** Under this alternative a company would assign an interest cost to all funds used in construction, whether borrowed or not. Therefore, the company would have to impute and capitalize an interest cost for the equity funds (common stock) used in construction in addition to the cost of borrowed funds. While it often is argued that this alternative provides the fairest economic cost of the asset, two major problems have prevented its adoption. First, there might be disagreement about the rate to be used for the imputed cost of the equity funds, and this amount would lack *reliability*. Second, since the computed interest cost of the equity funds would be debited to the asset, it would be necessary to record a credit. The credit could be to a revenue account, but that would violate the revenue recognition principle, since revenue should not be recognized as a result of acquiring assets. Another alternative would be to credit stockholders' equity directly, but there has been no contribution of capital by the owners, and the net worth of the company has not increased.
- (c) ***Capitalize the interest on funds borrowed for the construction.*** Under this alternative a company would treat the cost of borrowed funds as part of the cost of acquiring an asset and therefore as equivalent to the other costs of construction, such as materials and labor. The advantages are (1) the cost of the borrowed funds is necessary to obtain the benefits from the asset, and (2) since the asset is not yet generating revenue, the matching principle requires that the cost of interest (and depreciation) not be expensed during construction. The disadvantage is that the cost of the asset will differ depending on the type of financing (debt or equity) used for construction. There are two ways of interpreting this third alternative. The cost to be capitalized could be either the cost of funds *specifically* borrowed to finance the project or the *average* cost of all borrowed funds. Elements of both approaches are required by *FASB Statement No. 34*.

6. "Capitalization of Interest Cost," *FASB Statement of Financial Accounting Standards No. 34* (Stamford, Conn.: FASB, 1979).

## GAAP for Interest Capitalization

FASB *Statement No. 34* requires a company to complete three steps for its interest capitalization:

- Determine whether an asset qualifies for interest capitalization
- Calculate the amount of interest to capitalize
- Identify the period over which to capitalize interest

We discuss each step in the following sections.

**Assets Qualifying for Interest Capitalization** A company is required to capitalize interest on assets that are either constructed for its own use or constructed as discrete projects for sale or lease to others (for example, long-term construction projects such as ships or real estate developments, as we discuss in Chapter 18). Interest *cannot* be capitalized for the following types of assets:

1. Inventories that are routinely manufactured. Inventories are not qualifying assets because, in the view of the FASB, “the informational benefit does not justify the cost”<sup>7</sup> of capitalization.
2. Assets that are in use or ready for their intended use.
3. Assets that are not being used in the earning activities of the company and are not undergoing the activities necessary to get them ready for use.

**Amount of Interest to Be Capitalized** The amount of interest capitalized for a qualifying asset is based on the actual amounts borrowed and the cost of those borrowings. The amount is “intended to be that portion of the interest cost incurred during the asset’s acquisition periods that theoretically could have been avoided.”<sup>8</sup> A company determines the amount of interest to capitalize by applying an interest rate to the average cumulative invested costs (expenditures) for the qualifying asset during the capitalization period.

If a company incurs a specific borrowing for a qualifying asset, it applies the interest rate on that borrowing to the expenditures for the asset. If the expenditures on the asset exceed the cost of the specific borrowing or if no specific borrowing is made, the company applies the weighted average interest rate on all other borrowings. Because no imputed interest is allowed to be capitalized, the total amount of interest cost that a company capitalizes each period may not exceed the interest cost incurred during the period.

The expenditures to which a company applies this rate are the cumulative capitalized expenditures (which include any capitalized interest on the qualifying asset from previous periods). The company may assume for simplicity that the expenditures are incurred evenly throughout the period. Therefore, the average cumulative capitalized expenditures for a period are computed as follows:  $[(\text{beginning cumulative costs} + \text{ending cumulative costs}) \div 2]$ . If a company does not incur expenditures evenly throughout the period, a weighted average calculation would be used. If the company receives any progress payments from the eventual purchaser of the asset, it deducts these amounts from its expenditures, so that it capitalizes interest on its net expenditures.

**Period of Interest Capitalization** The capitalization period begins when (a) expenditures for the asset have been made, (b) activities that are necessary to get the asset ready for its intended use are in progress, and (c) interest cost is being incurred. Interest capitalization continues as long as the three conditions are present. Activities include all the steps necessary to prepare the asset for its intended use. For example, they include administrative and technical activities during the preconstruction stage and activities undertaken to overcome technical difficulties after construction has begun, such as labor disputes or litigation. If a company suspends

7. *Ibid.*, par. 10.

8. *Ibid.*, par. 12.

substantially *all* the activities related to the construction of the asset, however, it suspends interest capitalization until the activities are resumed.

The capitalization period ends when the asset is (a) substantially complete and (b) ready for its intended use. If the asset is completed in parts and each part can be used independently, interest capitalization stops for each part when that part meets the two criteria. In this case the interest capitalized is based on the average cost for that part. If the asset must be completed in its entirety before any part of the asset may be used, however, interest capitalization continues until the entire asset meets the two criteria.

### Example : Interest Capitalization

To illustrate these provisions of *FASB Statement No. 34*, consider the Cia Company, which started a building project on January 1, 2007 and completed it on December 31, 2008. Example 10-2 shows the relevant facts.

The company incurred the costs (expenditures) evenly during each year. It computes the average cumulative capitalized costs in the project to date for each year using the equations discussed earlier as we show in Example 10-2.

**EXAMPLE 10-2 Capitalization of Interest Costs**

Capitalization period: January 1, 2007 through December 31, 2008

Annual expenditures on the project (excluding capitalized interest):

2007 \$1 million

2008 \$2.9 million

Amounts borrowed and outstanding:

\$1.5 million at 10% borrowed specifically for the project

\$4 million at 12%

\$6 million at 13%

Average cumulative costs: 2007, \$500,000  $[(\$0 + \$1,000,000) \div 2]$

Capitalized interest, 2007 = Average cumulative cost  $\times$  Interest rate

= \$500,000  $\times$  10%

= \$50,000

Average cumulative costs: 2008, \$2,500,000  $[(\$1,000,000 + \$50,000^a) + (\$1,050,000 + \$2,900,000)] \div 2$

Capitalized interest, 2008 = Average cumulative cost  $\times$  Interest rate

=  $(\$1,500,000^b \times 10\%) + (\$1,000,000^c \times 12.6\%^d)$

= \$150,000 + \$126,000

= \$276,000

<sup>a</sup>\$50,000 capitalized interest for 2007

<sup>b</sup>\$1.5 million specific borrowing

<sup>c</sup>\$2,500,000 average cumulative cost for 2008 – \$1,500,000 specific borrowing

<sup>d</sup>Weighted average interest rate =  $(12\% \times \frac{\$4,000,000}{\$10,000,000}) + (13\% \times \frac{\$6,000,000}{\$10,000,000})$

= 4.8% + 7.8%

= 12.6%

Since the company borrowed \$1.5 million specifically for the project, it uses the 10% interest rate on this borrowing for each of the two years on the first \$1.5 million of costs. It computes interest each year on costs greater than \$1.5 million based on the weighted average of its remaining borrowings. It calculates the amount of interest to be capitalized in each of the two years as we show in Example 10-2.

Cia Company calculates the \$50,000 interest capitalized in 2007 by multiplying the \$500,000 average cumulative cost by the 10% interest rate on the specific borrowing for the project. The interest capitalized in 2008 requires two calculations, because the \$2,500,000 average cumulative cost exceeds the \$1,500,000 specifically borrowed for the project. First, the company calculates the \$150,000 ( $\$1,500,000 \times 10\%$ ) annual interest on the specific borrowing. Next, it multiplies the \$1,000,000 excess of average cost over specific borrowing ( $\$2,500,000 - \$1,500,000$ ) by the 12.6% weighted average interest rate to determine the \$126,000 additional interest to be capitalized. Thus it capitalizes a total of \$276,000 ( $\$150,000 + \$126,000$ ) interest in 2008.

As we mentioned earlier, the total amount of interest that is capitalized each period may not exceed the interest cost incurred during the period. Each year the company incurs interest costs of \$1.41 million [ $(\$1.5 \text{ million} \times 10\%) + (\$4 \text{ million} \times 12\%) + (\$6 \text{ million} \times 13\%)$ ]. This amount is clearly more than the capitalized interest in either year. If it were less, however, it would be the maximum amount that the company could capitalize in any given year. Assuming Cia Company has recorded interest expense for the \$1.41 million interest cost each year, it would record the capitalized interest at the end of 2007 and 2008, respectively, as follows:

**End of 2007**

<b>Building</b>	<b>50,000</b>	
<b>Interest Expense</b>		<b>50,000</b>

**End of 2008**

<b>Building</b>	<b>276,000</b>	
<b>Interest Expense</b>		<b>276,000</b>

Note that these journal entries *reduce* the net interest expense for each year and *increase* the cost of the building because of the capitalized interest. The company reports the remaining net interest expense amounts of \$1,360,000 ( $\$1,410,000 - \$50,000$ ) and \$1,134,000 ( $\$1,410,000 - \$276,000$ ), respectively, on its 2007 and 2008 income statements. Therefore, its pretax income is increased by \$50,000 in 2007 and \$276,000 in 2008. In addition, the company discloses the capitalized interest amounts of \$50,000 and \$276,000 in the notes to its financial statements. (Note that it also discloses the total interest paid each year, as we discuss in Chapter 22.)

The company reports a cost of \$1,050,000 (\$1 million construction cost + \$50,000 interest cost) for the construction-in-process on its December 31, 2007 balance sheet, and a cost of \$4,226,000 (\$3.9 million total construction costs + \$326,000 total interest cost) for the building on its December 31, 2008 balance sheet. The total interest capitalized over the two years is \$326,000 ( $\$50,000 + \$276,000$ ). Therefore, the cost of the asset is increased by this amount. This will reduce the gross profit on the sale if the asset is sold when completed, or increase the depreciation expense each year if the asset is held by the company. ♦

In some cases, a company may borrow a larger amount than it requires for its immediate construction needs. A question arises as to whether the company should offset the interest revenue earned by investing the excess funds against the interest cost to determine the amount of interest to be capitalized. Since *FASB Statement No. 34* states that the amount of interest to be capitalized is the portion of the interest that theoretically could have been avoided, the interest revenue should *not* be offset against the interest cost. The decision of a company to borrow greater amounts than needed and to invest the excess does not affect the avoidable interest and therefore does not affect the amount of interest to be capitalized.<sup>9</sup> Therefore, the interest earned is recognized and reported as interest revenue in the normal way.

9. "Offsetting Interest Cost to Be Capitalized with Interest Income," *FASB Technical Bulletin No. 81-5* (Stamford, Conn.: FASB, 1981).

## LINK TO INTERNATIONAL DIFFERENCES

International accounting standards for the capitalization of interest may be different from U.S. standards. International standards state that the “benchmark” method is to expense all interest costs. However, the capitalization of interest during the acquisition, construction, or production of a qualifying asset is an allowable alternative. This allowed alternative approach is similar to the capitalization rules under U.S. GAAP. So the flexibility allowed under international standards may create a lack of comparability with companies following U.S. standards. (There are also some differences in the two sets of capitalization rules that are beyond the scope of this book.)

### Fixed Overhead Costs

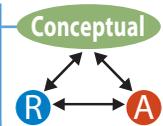

There are three alternatives for a company to include fixed overhead costs in the cost of a self-constructed asset. They are (1) to allocate a portion of the total fixed overhead, (2) to include only the incremental fixed overhead, and (3) not to include any fixed overhead in the cost of the asset. Each alternative should be considered for two production situations. First, the company may be operating at full capacity, so that the construction activity reduces normal production activity. Second, the company may be operating at below-normal capacity, so that the construction activity does not affect normal production activity.

1. **Allocate a portion of total fixed overhead to the self-constructed asset.** Under this alternative, the company allocates the fixed overhead to the construction in the same manner as to units of inventory produced. This is a “full costing” concept, because the total overhead costs of the period are allocated to the production of inventory and the construction of the asset. Arguments in favor of this alternative are (1) the construction should be accounted for in the same way as regular products, even though this means that the regular products will be allocated less of the overhead, and (2) the cost of the constructed asset will tend to approximate more closely the cost of an equivalent purchased asset, since the seller normally would include fixed overhead in its selling price. The first argument is especially relevant if the company is operating at full capacity prior to the construction, so that the construction causes less regular production to take place. Then the lower total overhead allocated to production coupled with lower productive output results in more consistent unit costs. When the company is operating at below-normal capacity prior to construction, allocation of some fixed overhead to self-constructed assets reduces the costs allocated to regular production and therefore increases the income reported for these products when they are sold. Thus there is a transfer of overhead costs from regular production to the self-constructed asset.
2. **Include only incremental fixed overhead in the cost of the self-constructed asset.** Under this alternative, the company includes only the fixed overhead that increases as a result of the construction (but no allocated overhead) in the cost of the self-constructed asset. Arguments in favor of this alternative are (1) the cost of an asset is the additional cost incurred to produce it, (2) the normal operations should not receive different treatment by reducing the cost of the regular product and increasing income because of the construction, (3) the overhead would be incurred whether or not the construction takes place, and (4) the decision to construct the asset should be based on the total incremental cost and not include allocated fixed overhead. This method is particularly appropriate when the company has excess capacity available so that regular production and income are not affected by the construction. If this method is used in a full-capacity situation, the unit cost of the regular production is increased because the same total fixed overhead is allocated to the reduced production.

3. **Include no fixed overhead in the cost of the self-constructed asset.** The primary argument in favor of this alternative is that the company's fixed overhead does not change as a result of the construction. Therefore, if the company included some overhead, this would result in less overhead being expensed in the current period (or included in the cost of inventory) and an increase in income. Of course, this alternative is reasonable only if the fixed overhead does not increase as a result of the construction.

In summary,

- the allocation of fixed overhead to a self-constructed asset is most appropriate when the company is operating at full capacity,
- the inclusion of only incremental fixed overhead is most appropriate in excess-capacity situations, and
- no allocation is appropriate if the overhead does not change.

Otherwise, the self-construction activity affects income, an effect that many people consider undesirable. Income should be a measure of the success of selling goods and services, and it should not depend on the amount of construction undertaken.

However, the first alternative of allocating a portion of the total fixed overhead to the self-constructed asset is supported for both situations by the Cost Accounting Standards Board as follows:

**Tangible capital assets constructed for a contractor's own use must be capitalized at amounts that include general and administrative [costs] when such [costs] are identifiable with the constructed asset and are material in amount. When the constructed assets are identical with or similar to the contractor's regular product, such assets must be capitalized at amounts that include a full share of indirect costs.<sup>10</sup>**

This method is the most commonly used and tends to produce an asset cost that is closer to the cost of a purchased asset, because an independent contractor would include an allowance to cover its overhead and income. However, it also tends to result in increased income during construction.

## Income on Self-Construction

If a company constructs an asset for less than it would cost to purchase, should it recognize income for the difference between the two costs? An argument can be made in favor of recognizing income, since it would tend to produce an asset cost similar to the purchase price of the asset. However, generally accepted accounting principles do not allow recognition of income in this case. To do so would violate the revenue recognition principle that requires a company to recognize income through asset use and disposal and not through acquisition. In addition, accounting is based on actions taken, not on what might have been. The company will realize the saving from self-construction with reduced depreciation charges in the future. However, the conservatism convention requires that, if the construction cost materially exceeds the fair value of the asset, the company must write down the capitalized construction costs of the asset to fair value and recognize a loss.

## Development Stage Companies

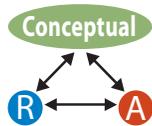

Development stage companies devote substantially all their efforts to establishing a new business, and their planned principal operations have not yet started or no significant revenue has been generated. Some people argue that a new company should capitalize the costs of interest, taxes, and general overhead during its development stage—that is, before it makes

10. "Capitalization of Tangible Assets," *CASB Standard 404* (Washington, D.C.: CASB, 1973).

significant sales. They argue that the costs incurred in the development stage will benefit future periods. Therefore, the company should not report losses before it makes sales. In **FASB Statement No. 7** this argument was rejected. Instead normal capitalization criteria are applied to development stage companies. Therefore, a company expenses such costs as interest (except for the provisions of *FASB Statement No. 34*), taxes, and general overhead in the period incurred. *FASB Statement No. 7* does impose some special disclosure requirements on development stage companies, but these are beyond the scope of this book.

## COSTS AFTER ACQUISITION

### 5 Record costs after acquisition.

A company incurs costs over the life of its property, plant, and equipment for purposes ranging from routine repairs to major overhauls and improvements. The related accounting decision is whether these costs should be added (capitalized) to an asset account (a **capital expenditure**) or expensed (an **operating** or **revenue expenditure**). A cost that increases the future economic benefits of the asset above those that originally were expected is a **capital expenditure**. The future economic benefits can be increased by (1) extending the life of the asset, (2) improving productivity, (3) producing the same product at lower cost, or (4) increasing the quality of the product. A cost that does not increase the economic benefits but is incurred to maintain the existing benefits is an **operating expenditure**.

We discuss additions, improvements and replacements, rearrangement and moving, and repairs and maintenance in the following sections.

### Additions

The cost of an **addition** represents a new asset and therefore is capitalized. Adding a new wing to a building and installing a pollution-control device are examples of additions. When the addition involves removing an old asset, an issue arises as to how to account for the cost of the removal. For example, when a company adds a new wing to a building, it frequently makes alterations to the old building. If these alterations increase the economic benefits originally anticipated for the old building, then the cost of alteration is capitalized. If the alterations do not increase the original benefits of the old building, then the cost is expensed. In addition, the cost of any part of the asset that is demolished (for example, a connecting wall) should be removed from the accounts as the disposal of an asset, although this is rarely done because of immateriality or the difficulty of measurement.

### Improvements and Replacements

**Improvements** (sometimes called **betterments**) and **replacements** (sometimes called **renewals**) involve the substitution of new parts for old ones, and increase the economic benefits to be obtained from the asset. An improvement is the substitution of a better asset for the one currently used, such as the installation of a solar heating system in a building. A replacement is the substitution of an equivalent asset, such as a new engine in a truck. The related costs of improvements and replacements are capitalized. There are three alternative ways for a company to account for such capitalized expenditures, and the choice depends on the particular circumstances.

#### 1. Example: Substitution Method

When the book value of the old asset is known, it is removed from the accounts and the new asset recorded. For example, suppose that Pippa Company decides to replace its oil furnace with a gas furnace. The oil furnace is carried on the books at a cost of \$50,000 with accumulated depreciation of \$30,000. The scrap value of the old furnace is \$5,000, and the new furnace costs \$70,000. Pippa Company records this transaction as follows:

Furnace	70,000	
Accumulated Depreciation: Furnace	30,000	
Loss on Disposal of Furnace (\$20,000 – \$5,000)	15,000	
Furnace		50,000
Cash (\$70,000 – \$5,000)		65,000 ♦

Although this is the ideal method, it often is not practical because the company does not know the book value of the asset being replaced. For example, when the company replaces the engine on a truck, it may not know the book value of the engine. In these situations, it should use one of the following two alternative methods.

### 2. Example: Reduce Accumulated Depreciation

The costs of improvements and replacements are often debited to Accumulated Depreciation because some of the service potential that previously was written off has been restored. Therefore, it is appropriate to use this method for replacements when the service life of the asset has been extended. For example, suppose that Ellen Company incurs a capital expenditure of \$60,000 to replace a roof on its factory. Ellen Company had not planned to replace the roof, but it has extended the life of the factory. Ellen Company records the cost as follows:

Accumulated Depreciation	60,000	
Cash		60,000 ♦

### 3. Example: Increase the Asset Account

The costs of improvements and replacements may be capitalized directly to the asset account because an addition to the service potential of the asset has been made. This method is particularly appropriate for improvements when the benefits are increased above those originally expected. For example, Matt Company records a capital expenditure of \$80,000 to enlarge a factory that increases its usefulness as follows:

Factory	80,000	
Cash		80,000 ♦

Note that examples 2 and 3 have exactly the same effect on the book value of the asset, although the gross amounts in the two accounts would be different. In both cases, a new depreciation rate would be computed, as we discuss in the next chapter.

## Rearrangement and Moving

The costs of rearranging the facilities within a building or moving them to a new location are capitalized and expensed over the period expected to benefit. (This period is shorter than the economic life of the assets being moved if the company expects that it will move the assets again before the end of their service lives.) However, many companies expense such costs immediately, which is an acceptable procedure if the difference is immaterial.

## Repairs and Maintenance

When a company incurs routine repair and maintenance costs to maintain an asset in its operating condition, it expenses the costs in the period incurred. However, the classification of an expenditure as a repair may depend on how the company accounts for its assets. For example, if the company includes landscaping costs in a Land Improvements

account, it would account for the replacement of some trees as repairs and maintenance. If the company included the landscaping costs in a separate account, then it would most likely account for the replacement of these trees as an improvement or replacement.

Since a company may incur repair and maintenance costs unevenly during the year (e.g., it may schedule repairs for slack production periods), its interim financial statements (such as quarterly reports) will include different amounts of repair costs that, in turn, may give a misleading picture of the company's income. The amount of repair costs that a company records as an expense in each interim period may be averaged by using an allowance account.

**Example: Repairs and Maintenance**

Suppose Sanner Company anticipates spending \$60,000 on repair and maintenance during the year, but \$45,000 will be spent in the third quarter, with the remainder spread equally over the remaining three quarters. Sanner Company records these events as follows:

First Quarter

Repair Expense (\$60,000 ÷ 4)	15,000	
Allowance for Repairs		10,000
Cash, Accounts Payable, Inventory, etc.		5,000

Second Quarter

Repair Expense	15,000	
Allowance for Repairs		10,000
Cash, Accounts Payable, Inventory, etc.		5,000

Third Quarter

Repair Expense	15,000	
Allowance for Repairs		30,000
Cash, Accounts Payable, Inventory, etc.		45,000

Fourth Quarter

Repair Expense	15,000	
Allowance for Repairs		10,000
Cash, Accounts Payable, Inventory, etc.		5,000

The repair expense for each quarter is \$15,000 (one-fourth of the annual cost of \$60,000), and Allowance for Repairs has a zero balance at the end of the year. This procedure is acceptable for *interim* reporting because it allows a company to record equal expenses in each interim period. Sanner Company reports the balance in Allowance for Repairs as an addition to or offset from its property, plant, and equipment and not as a liability because nothing is owed. However, a balance in Allowance for Repairs is not carried over from one *annual* fiscal period to another, because such smoothing of income is not allowed under generally accepted accounting principles. If a balance does remain in the Allowance for Repairs account at the end of the year, it is closed to the Repair Expense account. ♦

**DISPOSAL OF PROPERTY, PLANT, AND EQUIPMENT**

A company may dispose of property, plant, and equipment by sale, involuntary conversion, abandonment, or exchange (which we discussed earlier in the chapter). Ideally, the depreciation, which is accumulated up to the time of disposal, will have reduced the book value down to the disposal value. Usually, however, this does not occur, and the company must recognize a gain or a loss on the disposal. The gain or loss may be considered a correction of the income that has been recorded in the years the asset has been owned, since it is an indication that the depreciation was not correct. However, GAAP requires that a company record a gain or loss on disposal in the period of the disposal. The company usually includes the gain or loss in ordinary income, but it could also be reported as an

6 Record the disposal of property, plant, and equipment.

extraordinary item or a disposal of a component of a business if it meets the appropriate criteria established in **FASB Statement No. 144**, as we discussed in Chapter 4.

To account for the disposal of property, plant, and equipment, the company first records the depreciation up to the date of the disposal (as we discuss in the next chapter). It then removes the cost of the asset and the related amount of accumulated depreciation from the respective accounts.

### Example: Disposal of Machine

Assume that Bean Company has a machine that originally cost \$10,000, has accumulated depreciation of \$8,000 at the beginning of the current year, and is being depreciated at \$1,000 per year. If the company sells the machine for \$600 on December 30, it must first bring the depreciation up to date as follows:

Depreciation Expense	1,000	
Accumulated Depreciation		1,000

Once the book value is up to date, the company compares it to the proceeds to determine the gain or loss. Comparing the \$1,000 [ $\$10,000 - (\$8,000 + \$1,000)$ ] book value of the asset on December 30 to the \$600 proceeds yields a loss of \$400, which Bean Company records as follows:

Cash	600	
Accumulated Depreciation	9,000	
Loss on Disposal	400	
Machine		10,000

An involuntary disposal, such as condemnation of land by a governmental unit, is accounted for in the same way.<sup>11</sup> An abandonment is handled in a similar way, except that there is no receipt of cash, so the loss is equal to the remaining book value. ♦

### Asset Retirement Obligations

The acquisition of some assets automatically creates a legal obligation related to the retirement of the asset. For example, companies owning power plants, mines, and industrial manufacturing sites frequently are legally required to incur significant costs related to their closure. **FASB Statement No. 143** requires a company to record a legal liability for the obligation at its fair value when the obligation is incurred, which is usually when the asset is acquired. The most common method of measuring the fair value is likely to be the present value of the future cash flows that will be paid by the company. When the company acquires the asset (and records the liability) the present value is less than the future cash flows, and therefore, it must increase the liability over time. So the company recognizes interest expense (called accretion expense) each year it uses the asset. It calculates the expense by multiplying the book value of the liability by the discount rate it used to compute the original present value. On the date the company retires the asset and pays the retirement costs, it debits the obligation and credits cash. The company recognizes any difference between the estimated retirement costs (i.e., the liability) and the actual costs as a gain or loss.

When the company records (credits) the initial liability, it also records (debits) the same amount as an increase in the carrying value of the related asset. The company expenses (depreciates) this cost in the usual way by means of a systematic and rational allocation method over its useful life.<sup>12</sup>

11. "Accounting for Involuntary Conversions of Nonmonetary Assets to Monetary Assets," *FASB Interpretation No. 30* (Stamford, Conn.: FASB, 1979), requires that a gain or loss be recognized when a nonmonetary asset is involuntarily converted to monetary assets even though a company reinvests or is obligated to reinvest the monetary assets in replacement nonmonetary assets.

12. "Accounting for Asset Retirement Obligations," *FASB Statement of Financial Accounting Standards No. 143* (Norwalk, Conn.: FASB, 2001), par. 3, 11, and 14.

## SECURE YOUR KNOWLEDGE 10-2

- The initial cost of self-constructed assets includes direct material, direct labor, and a portion of the company's overhead costs.
  - If the asset qualifies for interest capitalization, avoidable interest (computed by applying an appropriate interest rate to the average cumulative cost) is capitalized as long as it does not exceed the actual interest cost incurred during the period.
  - Management may choose to allocate a portion of fixed overhead, include incremental fixed overhead, or exclude fixed overhead from the cost of a self-constructed asset.
  - Income recognition is not allowed if a company constructs an asset for less than it would have cost to purchase it.
- Expenditures that increase the future economic benefits of an asset (e.g., extend the useful life of the asset, improve productivity, decrease operating costs, or increase the quality of the product) are capital expenditures and are added to the cost of the asset.
- Expenditures that simply maintain the existing level of benefits are operating (or revenue) expenditures and are expensed in the current period.
- When a company disposes of property, plant, and equipment by sale, involuntary conversion, or abandonment, any resulting gain or loss is included in current period income.
- An asset retirement obligation (any liability related to the retirement or disposition of property, plant, and equipment) is required to be capitalized at fair value on the date the obligation is incurred. After acquisition, a company increases the liability over time by recognizing interest expense (accretion expense), and depreciates the asset using a systematic and rational method.

## DISCLOSURE OF PROPERTY, PLANT, AND EQUIPMENT

APB Opinion No. 12 requires a company to disclose the balances of its major classes of depreciable assets by nature or function.<sup>13</sup> We show an example of each of these methods in Real Report 10-1. **Johnson & Johnson** discloses by the nature of the assets, such as land, buildings, and machinery. **Norfolk Southern** discloses by function, such as road and equipment.

7 Understand the disclosures of property, plant, and equipment.

### Real Report 10-1 Disclosures of Depreciable Assets

#### JOHNSON & JOHNSON AND SUBSIDIARIES

##### Notes to Consolidated Financial Statements (in part)

##### 1. Summary of Accounting Principles (in part):

##### Property, Plant, and Equipment and Depreciation

Property, plant, and equipment are stated at cost. The Company utilizes the straight-line method of depreciation over the estimated useful lives of the assets:

Building and building equipment	20–40 years
Land and leasehold improvements	10–20 years
Machinery and equipment	2–13 years

##### 3 Property, Plant and Equipment

At the end of 2004 and 2003, property, plant and equipment at cost and accumulated depreciation were:

<i>(Dollars in Millions)</i>	2004	2003
Land and land improvements	\$ 515	\$ 491
Buildings and building equipment	5,907	5,242
Machinery and equipment	10,455	9,638
Construction in progress	1,787	1,681
	<u>18,664</u>	<u>17,052</u>
Less accumulated depreciation	8,228	7,206
	<u>\$ 10,436</u>	<u>\$ 9,846</u>

The Company capitalizes interest expense as part of the cost of construction of facilities and equipment. Interest expense capitalized in 2004, 2003 and 2002 was \$136 million, \$108 million and \$98 million, respectively.

Upon retirement or other disposal of fixed assets, the cost and related amount of accumulated depreciation or amortization are eliminated from the asset and accumulated depreciation accounts, respectively. The difference, if any, between the net asset value and the proceeds is adjusted to earnings.

#### NORFOLK SOUTHERN CORPORATION AND SUBSIDIARIES

##### Notes to Consolidated Financial Statements (in part)

##### 1. Summary of Significant Accounting Policies (in part):

*Properties:* "Properties" are stated principally at cost and are depreciated using group depreciation. Rail is depreciated primarily on the basis of use measured by gross ton

*Continued*

13. "Omnibus Opinion—1967," APB Opinion No. 12 (New York: AICPA, 1967), par. 5.

miles. Other properties are depreciated generally using the straight-line method over the lesser of estimated service or lease lives. NS capitalizes interest on major capital projects during the period of their construction. Expenditures, including those on leased assets, that extend an asset's useful life or increase its utility, are capitalized. Maintenance expense is recognized when repairs are performed. When properties other than land and non-rail assets are sold or retired in the ordinary course of business, the cost of the assets, net of sale proceeds or salvage, is charged to accumulated depreciation, and no gain or loss is recognized through income. Gains and losses on disposal of land and non-rail assets are included in "Other income-net."

NS reviews the carrying amount of properties whenever events or changes in circumstances indicate that such carrying amount may not be recoverable based on future undiscounted cash flows. Assets that are deemed impaired as a result of such review are recorded at the lower of carrying amount or fair value.

#### 6. Properties

(\$ in millions)	December 31,		Depreciation Rate for 2004
	2004	2003	
Railway property:			
Road	\$19,530	\$11,243	3.0%
Equipment	6,661	5,779	4.2%
Other property	574	569	2.9%
	<u>26,765</u>	<u>17,591</u>	
Less: Accumulated depreciation	<u>6,239</u>	<u>5,812</u>	
Net properties	<u>\$20,526</u>	<u>\$11,779</u>	

Railway property includes \$618 million at Dec. 31, 2004 and \$477 million at Dec. 31, 2003, of assets recorded pursuant to capital leases. Other property includes the costs of obtaining rights to natural resources of \$341 million at Dec. 31, 2004 and 2003.

Total interest cost incurred on debt in 2004, 2003 and 2002 was \$499 million, \$509 million and \$529 million respectively, of which \$10 million, \$12 million and \$11 million was capitalized.

#### Questions:

1. If Johnson & Johnson had not capitalized interest in 2004, how would its financial statements be different?
2. What are the effects on the financial statements of the method used by Norfolk Southern for the sale of its properties? Is it different from the method used by Johnson & Johnson?
3. Why does Norfolk Southern account for the sale of land differently than the sale of other properties?

# 1 3

## LINK TO RATIO ANALYSIS

The analysis of property, plant, and equipment is often concerned with a company's ability to use its investment in assets to generate income. An examination of a company's return on assets, a profitability ratio, provides an indication of how efficiently a company uses its economic resources. Consider the following information from **Microsoft's** 2004 annual report:

(in millions)	
Net Sales	\$36,835
Net Income	5,355
Total Assets, beginning of year	81,732
Total Assets, end of year	92,389

Microsoft's return on assets<sup>14</sup> is shown in the following equation:

$$\text{Return on Assets} = \frac{\text{Net Income}}{\text{Average Total Assets}} = \frac{\$5,355}{\left(\frac{\$81,732 + \$92,389}{2}\right)} = 6.1\%$$

A company's return on assets is driven by two factors: how effective a company is at controlling its costs and expenses in relation to sales (profit margin) and how well a company manages its assets to generate sales (asset turnover). Additional insights into Microsoft's profitability can be obtained by separating its return on assets into these two ratios as shown in the following equation:

$$\begin{aligned} \text{Return on Assets} &= \text{Profit Margin} \times \text{Asset Turnover} = \frac{\text{Net Income}}{\text{Net Sales}} \times \frac{\text{Net Sales}}{\text{Average Total Assets}} \\ &= \frac{\$5,355}{\$36,835} \times \left(\frac{\$36,835}{\left(\frac{\$81,732 + \$92,389}{2}\right)}\right) = 14.5\% \times 42.3\% = 6.1\% \end{aligned}$$

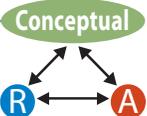

Based on this equation, Microsoft's profit margin indicates that every dollar of sales generated approximately \$0.145 of income and that Microsoft was able to generate \$0.423 of sales per dollar invested in assets.

## APPENDIX: OIL AND GAS PROPERTIES

A company faces special issues when accounting for oil and gas properties that are included in its property, plant, and equipment. Two alternative methods of accounting for the cost of oil and gas properties are widely used. The principal difference between the two methods concerns the cost of dry wells—those that do not result in the production of oil or gas. Under the **successful-efforts** method, those costs are expensed; under the **full-cost** method, they are capitalized as part of the cost of oil and gas reserves, and then amortized.

Proponents of the *successful-efforts method* argue that a direct relationship between costs incurred and specific reserves discovered is required before costs are recorded as assets. Costs of acquisition and development activities that are known not to have resulted in the discovery of reserves are expensed. In contrast, the *full-cost method* regards the costs of unsuccessful

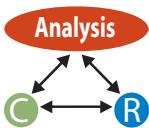

8 Explain the accounting for oil and gas properties.

14. Return on assets is often computed by adding interest expense (net of tax) back to net income because interest is a financial cost to pay creditors, not a cost of generating sales. However, because Microsoft has such a small percentage of long-term debt, we ignore interest cost for this calculation.

acquisition and exploration activities as necessary for the discovery of reserves. Thus, all costs incurred in oil and gas drilling are regarded as integral to the development of whatever reserves ultimately result from the efforts as a whole, and are thus associated with the company's reserves. Establishing a direct cause-and-effect relationship between drilling costs incurred and specific reserves discovered is not relevant to full costing.

The basic difference between the two methods focuses on the nature of an asset. If the asset is viewed as an individual well, it is appropriate for a company to expense the costs incurred if no oil or gas is found, because no future cash flows will result. Alternatively, if the asset is viewed as the oil or gas that lies underground, it is appropriate for a company to capitalize the costs of drilling even if no oil or gas is found from a particular well, because the activity was necessary in searching for oil or gas. It is the oil or gas that is discovered that will contribute to the future cash flows rather than the costs incurred to drill any particular well. A company that uses the full-cost method is required (by the SEC, as discussed later) to use a country as a cost center. Thus if costs are incurred in a new country and no oil or gas results, the costs are expensed.

Because both methods are widely used, difficulties are created for users of financial statements when making comparisons between companies that are each using different methods. Large oil and gas companies generally use the successful-efforts method, whereas small independent producers prefer the full-cost method because it enables them to defer more costs, thereby reducing current expenses and increasing current income.

In 1977 **FASB Statement No. 19** was issued, which required the use of the successful-efforts method. The FASB cited two primary reasons to justify the adoption of the successful-efforts method. First, an asset is an economic resource that is expected to provide future benefits, so costs that are known not to have resulted in identifiable future benefits should be expensed. Second, financial statements should reflect risk and unsuccessful results. The successful-efforts method highlights the cost of failures and the risks involved in the search for oil and gas reserves. In a politically motivated decision, the SEC decided not to support the FASB's position. Many of the owners and managers of oil and gas companies that were using full-cost accounting objected to its elimination and lobbied Congress. They argued that the use of successful efforts would cause reported income and assets to be lower, and would impair the ability of their companies to raise capital and search for oil and gas. This argument is inconsistent with efficient markets research, which indicates that users of financial statements would not be "fooled" by the different reporting of the same underlying economic facts. However, Congress accepted the argument and directed that the SEC must accept the use of the full-cost method in reports filed with it, thereby allowing both methods to continue to be used. Consequently, the FASB suspended *FASB Statement No. 19*.

It can be argued that neither method satisfies the needs of users of financial statements because they do not reflect the economic substance of oil and gas exploration. That is, neither one includes the current values of a company's oil and gas reserves in its financial statements. Thus, the SEC established a completely new method of accounting called Reserve Recognition Accounting (RRA). RRA allowed a company to report the current values of reserves on its balance sheet and changes in the values of those reserves to be included on its income statement. Effective in 1979, companies were required to present a supplementary income statement, based on RRA, while continuing to use successful-efforts or full-cost accounting. Later, the SEC rescinded the requirement to use RRA, and therefore oil companies now use either the full-cost or the successful-efforts method. Once a company has selected one of the two alternative methods, it must follow specific SEC accounting rules.<sup>15</sup> If the successful-efforts method is chosen, the SEC requires that the rules of *FASB Statement No. 19* must be followed. In addition, *FASB Statement No. 69* requires that oil companies disclose the physical and dollar amounts of reserves at year-end and changes in these amounts. Since these accounting problems relate to a specific industry, we do not discuss them further.

15. "Codification of Financial Reporting Policies," *SEC Accounting Rules* (Chicago: Commerce Clearing House, 2005), sec. 406.

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

1. **Identify the characteristics of property, plant, and equipment.** Property, plant, and equipment is the title used to classify tangible noncurrent assets a company uses in the normal operations of its business. The asset must be held for use and not for investment, must have an expected life of more than one year, and must be tangible in nature.
2. **Record the acquisition of property, plant, and equipment.** Property, plant, and equipment is recorded at the total cost necessary to acquire the asset and put it in operating condition; that is, the costs that are necessary to obtain the benefits to be derived from the asset.
3. **Determine the cost of a nonmonetary asset acquired by the exchange of another nonmonetary asset.** The cost of the nonmonetary asset acquired is the fair value of the nonmonetary asset surrendered plus any cash paid or minus any cash received.
4. **Compute the cost of a self-constructed asset, including interest capitalization.** When a company constructs an item of property, plant, and equipment, the costs included in the asset cost are materials, labor, engineering, variable manufacturing overhead, interest, and perhaps allocated fixed manufacturing overhead. A company is required to capitalize interest on assets that are either constructed for its own use or constructed as discrete projects for sale or lease to others. The company determines the amount of interest to capitalize by applying an interest rate to the average cumulative invested costs for the qualifying asset during the capitalization period.
5. **Record costs after acquisition.** A subsequent cost that increases the future economic benefits of the asset above those that originally were expected is a capital expenditure. A subsequent cost that does not increase the economic benefits but is incurred to maintain existing benefits is an operating expenditure and is expensed.
6. **Record the disposal of property, plant, and equipment.** A company may dispose of property, plant, and equipment by sale, involuntary conversion, or abandonment. The company records depreciation up to the date of the sale and records a gain or loss for the difference between the book value of the asset and the proceeds received.
7. **Understand the disclosures of property, plant, and equipment.** A company is required to disclose the balances of its major classes of depreciable assets by nature or function.
8. **Explain the accounting for oil and gas properties (Appendix).** A company may account for oil and gas properties using either the full cost method, in which the cost of dry holes is capitalized, or the successful efforts method, in which the cost of dry holes is expensed.

## ANSWERS TO REAL REPORT QUESTIONS

### Real Report 10-1 Answers

1. The capitalization of interest in 2004 by Johnson & Johnson resulted in a \$136 million decrease in interest expense reported on the income statement, and a \$136 million increase in income, assets (property, plant, and equipment), and stockholders' equity.
2. Norfolk Southern uses the group depreciation method for "properties" (group depreciation is discussed in Chapter 11). Under this method, the sale of properties other than land and non-rail assets is recorded by a debit to cash for any sale proceeds and a credit to the asset account. Any gain or loss on the sale (the difference between the cost of the asset and the sale proceeds) is recorded as an adjustment to accumulated depreciation. For land and non-rail assets, Norfolk Southern includes any gain or loss in income. Johnson & Johnson records retirements or disposals in a manner consistent with the latter method.
3. Norfolk Southern uses group depreciation for its railway property because the assets are homogeneous (similar) and this method simplifies the company's record-keeping. However, the unique nature of land necessitates a different accounting method relative to the similar, relatively lower cost railway properties.

## QUESTIONS

- Q10-1** What characteristics are necessary for a company to include an asset in the category of property, plant, and equipment?
- Q10-2** What is the general criterion a company uses to decide whether to include an expenditure in the cost of property, plant, and equipment rather than expensing it?
- Q10-3** How does a company categorize land held for investment on its balance sheet?
- Q10-4** What is the book value of an asset?
- Q10-5** What is the relationship between the book value and the market value of an asset during the life of the asset?
- Q10-6** When a company purchases several assets for a single lump sum, what principle does it use for cost apportionment? Why is it necessary to apportion the cost?
- Q10-7** How does a company determine the acquisition cost of an asset when it acquires the asset in exchange for securities?
- Q10-8** At what amount does a company record the cost of a nonmonetary asset acquired in exchange for another nonmonetary asset?
- Q10-9** How much does a company recognize as a gain or loss when it exchanges nonmonetary assets?
- Q10-10** Under what conditions does a company capitalize the interest incurred during self-construction of an asset? Contrast your answer with accounting for interest on a note payable that is not associated with the construction of an asset.
- Q10-11** Explain how a company determines the amount of interest to capitalize when it constructs an asset.
- Q10-12** A company borrows some money which it uses to acquire a parcel of land for a real estate development project. Before construction begins, a period of time passes while the company obtains the necessary planning permission. May the company capitalize interest during this period? If so, should it capitalize the interest to the land or the building account?
- Q10-13** What are the three common alternative treatments of overhead costs during self-construction of an asset? What are the arguments in favor of each?
- Q10-14** May a company recognize profit during self-construction of an asset under generally accepted accounting principles? May it recognize a loss?
- Q10-15** What is the distinction between a capital and an operating expenditure? Give two examples of each.
- Q10-16** Distinguish between additions and improvements/replacements. How should a company account for each?
- Q10-17** Distinguish between ordinary repairs and maintenance, and extraordinary repairs. How should a company account for each?
- Q10-18** What are leasehold improvements? How should a company account for them?
- Q10-19** Under what conditions would you expect to see Allowance for Repairs in a company's balance sheet?
- Q10-20** How does a company account for the disposal of an asset? How does it report gains and losses on its financial statements?
- Q10-21 (Appendix)** Distinguish between successful efforts and full cost accounting for oil and gas properties.

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

**M10-1** The Hickory Company made a lump-sum purchase of three pieces of machinery for \$115,000 from an unaffiliated company. At the time of acquisition Hickory paid \$5,000 to determine the appraised value of the machinery. The appraisal disclosed the following values:

Machine A \$70,000                      Machine B \$42,000  
Machine C \$28,000

What cost should be assigned to machines A, B, and C, respectively?

	A	B	C
a.	\$40,000	\$40,000	\$40,000
b.	\$57,500	\$34,500	\$23,000
c.	\$60,000	\$36,000	\$24,000
d.	\$70,000	\$42,000	\$28,000

**M10-2** A donated plant asset for which the fair value has been determined, and for which incidental costs were incurred in acceptance of the asset, should be recorded at an amount equal to its

- Incidental costs incurred
- Fair value and incidental costs incurred
- Book value on books of donor and incidental costs incurred
- Book value on books of donor

**M10-3** The following expenditures were among those incurred by Jensen Corporation during the year ended December 31, 2007:

Replacement of tiles on portion of roof that had been leaking	\$4,000
Overhaul of machinery that is expected to extend its useful life for another two years	6,000

How much should be charged to repairs and maintenance in 2007?

- a. \$0  
b. \$4,000
- c. \$6,000  
d. \$10,000

**M10-4** The sale of a depreciable asset resulting in a loss indicates that the proceeds from the sale were

- a. Less than current market value  
b. Greater than cost  
c. Greater than book value  
d. Less than book value

**M10-5** Electro Corporation bought a new machine and agreed to pay for it in equal annual installments of \$5,000 at the end of each of the next five years. Assume a prevailing interest rate of 15%. The present value of an ordinary annuity of \$1 at 15% for five periods is 3.35. The future amount of an ordinary annuity of \$1 at 15% for five periods is 6.74. The present value of \$1 at 15% for five periods is 0.5. How much should Electro record as the cost of the machine?

- a. \$12,500  
b. \$16,750
- c. \$25,000  
d. \$33,700

**M10-6** When a company purchases land with a building on it and immediately tears down the building so that the land can be used for the construction of a plant, the costs incurred to tear down the building should be

- a. Expensed as incurred  
b. Added to the cost of the plant  
c. Added to the cost of the land  
d. Amortized over the estimated time period between the tearing down of the building and the completion of the plant

**M10-7** When a company replaces an old asphalt roof on its plant with a new fiberglass insulated roof, which of the following types of expenditure occurs?

- a. Ordinary repair and maintenance  
b. Addition
- c. Rearrangement  
d. Betterment

**M10-8** On January 2, 2007 Yuki Yogurt Company decided to replace its obsolete refrigeration system with a more efficient one. The old system had a book value of \$9,000 and a fair value of \$1,000. Yuki's new refrigeration system has a fair value of \$190,000, for which Yuki paid \$189,000 after permitting the contractor to keep the old refrigeration equipment. How much should Yuki capitalize as the cost of the new refrigeration system?

- a. \$189,000  
b. \$190,000
- c. \$197,000  
d. \$198,000

**M10-9** During 2007, Belardo Corporation constructed and manufactured certain assets, and incurred the following interest costs in connection with those activities:

	Interest Costs Incurred
Warehouse constructed for Belardo's own use	\$20,000
Special-order machine for sale to unrelated customer, produced according to customer's specifications	9,000
Inventories routinely manufactured, produced on a repetitive basis	7,000

All of these assets required an extended period of time for completion. Assuming that the effect of interest capitalization is material, what is the total amount of interest costs to be capitalized?

- a. \$0  
b. \$20,000
- c. \$29,000  
d. \$36,000

**M10-10** Lyle, Inc., purchased certain plant assets under a deferred payment contract on December 31, 2007. The agreement was to pay \$20,000 at the time of purchase and \$20,000 at the end of each of the next five years. The plant assets should be valued at

- a. The present value of a \$20,000 ordinary annuity for five years  
b. \$120,000  
c. \$120,000 less imputed interest  
d. \$120,000 plus imputed interest

## EXERCISES

**E10-1 Determination of Cost** Which of the following 22 items does a company include in the cost of property, plant, and equipment?

- Contract price
- List price
- Freight costs

4. Discounts taken
5. Discounts not taken
6. Installation costs
7. Testing costs
8. Cost of overhaul before initial use
9. Costs of grading land prior to construction
10. Tax assessment for street improvements
11. Delinquent property taxes on acquired property
12. Cost of tearing down an old building (already owned) in preparation for new construction
13. Cost of insurance during construction
14. Excess of costs over revenues during the development stage of the company
15. Interest costs during construction
16. Landscaping costs
17. Severance pay for employees dismissed because of the acquisition of a new machine
18. Cost of tearing down a building on newly acquired land
19. Replacement of an electric motor in a machine
20. Expansion of the heating/cooling system to accommodate an expansion of a building and certain expected future needs
21. Service contract for two years on the acquired asset
22. Cost of training new employees

**E10-2 Inclusion in Property, Plant, and Equipment** Which of the following does a company include in property, plant, and equipment on the balance sheet?

1. Idle equipment awaiting sale
2. Land held for future use as a plant site
3. Land held for investment
4. Deposits on machinery not yet received
5. Progress payments on building being constructed by a contractor
6. Fully depreciated assets still being used
7. Leasehold improvements
8. Assets leased to others

**E10-3 Acquisition Costs** The Voiture Company manufactures compact, energy efficient cars. On April 1, it purchased a machine for its assembly line at a contract price of \$200,000 with terms of 2/10, n/30. The company paid the contract price on April 8 and also incurred installation and transportation costs of \$5,000, sales tax of \$10,000, and testing costs of \$2,000. During testing the machine was accidentally damaged, so the company had to pay \$1,000 to repair it.

#### Required

Prepare the journal entry to record the acquisition of the machine.

**E10-4 Determination of Acquisition Cost** In January 2007 Cordova Company entered into a contract to acquire a new machine for its factory. The machine, which has a cash price of \$215,000, was paid for as follows:

Down payment	\$ 55,000
Note payable in four equal annual payments starting in January 2008	120,000
600 shares of Cordova preferred stock with a mutually agreed value of \$100 per share (par value \$100)	60,000
Fair rate of interest on the non-interest-bearing note	10%

#### Required

1. Prepare the journal entry to record the acquisition of the machine.
2. How would your answer change, if at all, if the \$215,000 cash price were not available?

**E10-5 AICPA Adapted Determination of Acquisition Cost** On August 1, 2007 Darmow Corporation purchased a new machine on a deferred payment basis. It made a down payment of \$1,000 and will make four monthly installments of \$2,500 each beginning on September 1, 2007. The cash equivalent price of the machine was \$9,500. Darmow incurred and paid installation cost amounting to \$300.

#### Required

Prepare the journal entry to record the acquisition of the machine.

**E10-6 AICPA Adapted Acquisition of Land and Building** On February 1, 2007 Edwards Corporation purchased a parcel of land as a factory site for \$50,000. It demolished an old building on the property, and began construction on a new building that was completed on October 2, 2007. Costs incurred during this period are:

Demolition of old building	\$ 4,000
Architect's fees	20,000
Legal fees for title investigation and purchase contract	2,000
Construction costs	500,000

The company sold salvaged materials resulting from the demolition for \$3,000.

**Required** 

At what amount should Edwards record the cost of the land and the new building, respectively?

**E10-7 Lump-Sum Purchase** The Garrett Corporation paid \$200,000 to acquire land, buildings, and equipment. At the time of acquisition, the company paid \$20,000 for an appraisal, which revealed the following values: land, \$100,000; buildings, \$125,000; and equipment, \$25,000.

**Required** 

What cost does the company assign to the land, buildings, and equipment, respectively?

**E10-8 Exchange of Assets** Two independent companies, Denver and Bristol, each own a warehouse, and they agree to an exchange in which no cash changes hands. The following information for the two warehouses is available:

	Denver	Bristol
Cost	\$90,000	\$45,000
Accumulated depreciation	55,000	25,000
Fair value	30,000	30,000

**Required**

Prepare journal entries for the Denver Company and the Bristol Company to record the exchange.

**E10-9 Exchange of Assets** Use the same information as in E10-8, except that the warehouse owned by Denver Company has a fair value of \$28,000, and therefore Denver agrees to pay Bristol \$2,000 to complete the exchange.

**Required**

Prepare journal entries for the Denver Company and the Bristol Company to record the exchange.

**E10-10 Exchange of Assets** Use the same information as in E10-8, except that the warehouse owned by Denver Company has a fair value of \$33,000, and therefore the Bristol Company agrees to pay the Denver Company \$3,000 to complete the exchange.

**Required**

Prepare journal entries for the Denver Company and the Bristol Company to record the exchange.

**E10-11 Exchange of Assets** The Goodman Company acquired a truck from the Harmes Company in exchange for a machine. The machine cost \$30,000, has a book value of \$6,000, and has a market value of \$9,000. The truck has a cost of \$12,000 and a book value of \$8,000 on Harmes' books.

**Required**

Prepare journal entries for the Goodman Company and the Harmes Company to record the exchange.

**E10-12 Exchange of Assets** Use the same information as in E10-11, except that the machine has a market value of \$8,500, and therefore the Goodman Company agrees to pay \$500 to complete the exchange.

**Required**

Prepare journal entries for the Goodman Company and the Harmes Company to record the exchange.

**E10-13 AICPA Adapted Exchange of Assets** Minor Baseball Company had a player contract with Doe that was recorded in its accounting records at \$145,000. Better Baseball Company had a player contract with Smith that was recorded in its accounting records at \$140,000. Minor traded Doe to Better for Smith by exchanging each player's contract. The fair value of each contract was \$150,000.

**Required**

What amounts should each company show in its accounting records for the exchange of player contracts?

**E10-14 Self-Construction** The Harshman Company constructed a building for its own use. The company incurred costs of \$20,000 for materials and supplies, \$48,000 for direct labor, and \$4,000 for a supervisor's overtime that was caused by the construction. The company uses a factory overhead rate of 50% of direct labor cost. Before construction, the company had received a bid of \$100,000 from an outside contractor.

**Required**

1. At what value should the company capitalize the building? Justify your answer.
2. Would your answer change if the bid from the outside contractor had been \$80,000? \$60,000?

**E10-15 Asset Acquired by Donation** The city of Littleton donated a building and land to the Hetting Co. without charge. The agreement provided that the company employ 350 people for 10 years. The land was appraised at \$65,000 and the building at \$44,000.

**Required**

1. Prepare the journal entry to record the acquisition of the land and building.
2. How should the 10-year agreement be reported in the financial statements?
3. If the title were not to pass until after 10 years, would your answer change?

**E10-16 Interest During Construction** The Snowbird Company is constructing a building that qualifies for interest capitalization. It is built between January 1 and December 31, 2007. Expenditures, which occur evenly throughout the year, totaled \$800,000. The company borrowed \$500,000 at 12% to help finance the project. In addition, the Snowbird Company had outstanding borrowings of \$2 million at 8%.

**Required**

1. Compute the amount of interest capitalized on the building.
2. What effect does the interest capitalization have on the company's financial statements after it completes the building?

**E10-17 Calculating Capitalized Interest** The Kit Company borrows \$5 million at 12% on January 1, 2007 specifically for the purpose of financing a construction project. The company invests the total amount at 11% until it makes payments for the construction project. During the first year of construction, the company incurs construction costs of \$4 million evenly over the year.

**Required**

Compute the amount of interest that the company would capitalize and the amount of interest revenue it would recognize.

**E10-18 Capital and Operating Expenditures** Which of the following 10 items does a company record as a capital expenditure and which as an operating expenditure?

- |  |   |
|--|---|
| 1. Cost of installing machinery                                    | 6. Property taxes on land and buildings                     |
| 2. Cost of moving machinery  | 7. Property taxes on land and buildings held for investment |
| 3. Repairs as a result of an accident                              | 8. Cost of rearranging offices                              |
| 4. Cost of major overhaul  | 9. Cost of repainting offices                               |
| 5. Installation of safety device as a result of an OSHA inspection | 10. Ordinary repairs  |

**E10-19 Oil and Gas Accounting (Appendix)** The Lawrence Company spends \$4 million in 2007 drilling oil wells. Sixty percent of the drilling is successful and results in commercial quantities of oil being found.

**Required**

1. How much drilling expense does the company recognize under
  - a. The successful-efforts method?
  - b. The full-cost method?
2. At what value does the company report the asset, Oil and Gas Properties, in its balance sheet under
  - a. The successful-efforts method?
  - b. The full-cost method?

## PROBLEMS

**P10-1 Acquisition Costs** The Mawn Company bought land and built a warehouse during 2007. It debited the following related costs to an account titled Land and Buildings:

Land purchase	\$22,000
Demolition of old building	3,000

Legal fees for land acquisition	1,500
Interest on loan for construction (based on average costs incurred)	2,900
Building construction	53,000
Assessment by city for sewer connection	1,200
Landscaping	3,500
Equipment purchased for excavation	18,800
Fixed overhead charged to building	15,000
Insurance on building during construction	1,000
Profit on construction	12,000
Compensation for injury to construction worker	3,000
Modifications to building ordered by building inspectors	7,500
Property taxes on land paid in 2007	2,500

The following credits were made to the account:

Salvage from demolished old building	\$ 700
Sale of excavation equipment	14,000

In addition, you discover that compensation for the worker's injury was necessary because it was not covered by the particular insurance policy purchased by the company. Accident insurance that would have covered the injury would have cost an additional \$350. The modifications ordered by the building inspectors resulted from poor planning by the company.

#### Required

Prepare adjusting entries on December 31, 2007 to properly reclassify the preceding items.

**P10-2** *Costs Subsequent to Acquisition* As the first auditor of the Newberg Company you discover that the following entries have been made in the property, plant, and equipment account:

Property, Plant, and Equipment			
2006		2006	
Plant purchased	60,000	Depreciation	6,310
Legal fees	700		
Insurance	2,400		
2007		2007	
Repairs	2,000	Depreciation	6,879
Addition to building	10,000		
2008		2008	
Repairs	3,000	Machine sold	500
Insurance	2,800	Depreciation	7,421
Machine purchased	7,000		

You discover the following additional information:

- The purchase of the plant included a building and machinery. When the plant was purchased, an appraisal showed that the building was valued at \$39,000 and the machinery at \$26,000.
- Depreciation has been recorded each year at 10% of the balance in the account. The 10% was chosen because the property is being depreciated over 10 years for tax purposes. Subsequent investigation indicates that the expected lives at the time of acquisition were: building, 20 years; machinery, 8 years.
- Each insurance payment was made on January 1 and was for a two-year policy.
- The machine that was sold in 2008 had an original cost of \$800.
- All purchases and sales of property, plant, and equipment items occurred at the beginning of the year indicated.

#### Required

Prepare adjusting entries at December 31, 2008 to correct the books assuming they have not been closed for the year.

**P10-3** *Classification of Costs Associated with Assets* The following account balances were included in the balance sheet of the Bromley Company on December 31, 2006:

Land	\$100,000
Land improvements	20,000
Buildings	300,000
Machinery and equipment	500,000

During 2007 the following transactions occurred:

1. Land was acquired for \$70,000 for a future building site. Commissions of \$4,000 were paid to a real estate agent.
2. A factory and land were acquired from the Kent Development Company by issuing 20,000 shares of \$3 par common stock. At that time the stock was selling for \$10 per share on the New York Stock Exchange. The independently appraised values of the land and the factory were \$60,000 and \$180,000, respectively.
3. Machinery and equipment was acquired at a cost of \$120,000. In addition, sales tax, freight costs, and installation costs were \$7,000, \$10,000, and \$16,000, respectively. During installation, the machinery was damaged and \$2,000 was spent in repairs.
4. A new parking lot was installed at a cost of \$30,000.
5. A machine that had cost \$20,000 on January 1, 2003 and had a book value on December 31, 2007 of \$4,000 was sold on that date for \$6,000.
6. Half the land purchased in item 1 was prepared as a building site. Costs of \$26,000 were incurred to clear the land, and the timber recovered was sold for \$3,000. A new building was built for \$60,000 plus architect's fees and imputed interest on equity funds used during construction of \$18,000 and \$15,000, respectively. No debt is outstanding.
7. Costs of \$20,000 were incurred to improve some leased office space. The lease will terminate in 2009 and is not expected to be renewed.
8. A group of new machines was purchased under a royalty agreement that provides for payment of annual royalties based on units produced. The invoice price of the machines was \$30,000, freight costs were \$2,000, and royalty payments for 2007 were \$12,000.

### Required

Prepare journal entries to record all the preceding events. Unless otherwise indicated, assume the company makes all payments in cash.

**P10-4 CMA Adapted Self-Construction** The Olson Machine Company manufactures small and large milling machines. Selling prices of these machines range from \$35,000 to \$200,000. During the five-month period from August 1, 2007 through December 31, 2007, the company manufactured a milling machine for its own use. This machine was built as part of the regular production activities. The project required a large amount of time from planning and supervisory personnel, as well as that of some of the company's officers, because it was a more sophisticated type of machine than the regular production models.

Throughout the five-month period, the company charged all costs directly associated with the construction of the machine to a special account entitled "Asset Construction Account." An analysis of the charges to this account as of December 31, 2007 follows:

ASSET CONSTRUCTION ACCOUNT	
Item Description	Cost
<i>Raw Materials</i>	
Iron castings:	
Main housing, 3 sections	\$37,480
Movable heads, 2 heads @ \$3,900	7,800
Machine bed	4,760
Table, 2 sections @ \$5,500	<u>11,000</u>
	\$ 61,040
Other raw materials:	
Electrical components and wiring	\$28,000
Worm screws and housing	8,600
Cutter housings	2,700
Conveyor system	8,400
Other parts	<u>2,500</u>
	50,200
<i>Direct Labor Costs</i>	
Layout 90 hr. @ \$5.00	\$ 450
Electricians 380 hr. @ 9.00	3,420
Machining 1,100 hr. @ 8.00	8,800
Heat treatment 100 hr. @ 7.50	750
Assembly 450 hr. @ 7.00	3,150
Testing 180 hr. @ 8.00	<u>1,440</u>
	18,010
<i>Other Direct Charges</i>	
Repairs and maintenance during testing period	\$ 1,340
Interest expense from 8/1/07 to 12/31/07 on funds borrowed for construction purposes	4,260
Additional labor to assist during machine testing period, 180 hr. @ \$5.00	<u>900</u>
	6,500
Balance, December 31, 2007	<u>\$135,750</u>

The company allocates factory overhead to normal production as a percent of direct labor dollars as follows:

Departments	Factory Overhead Rates (applied as a percent of direct labor dollars)		Total
	Variable	Fixed	
Layout and electricians	50%	20%	70%
Machining,* heat treatment, and assembly	50%	50%	100%

\*All testing is conducted by employees in the machining department.

The company uses a flat rate of 40% of direct labor dollars to allocate general and administrative overhead.

During the machine testing period, a cutter head malfunctioned and did extensive damage to the machine table and one cutter housing. This damage was not anticipated and was the result of an error in the assembly operation. Although no additional raw materials were needed to make the machine operational after the accident, the following labor for rework was required:

	Direct Labor Hours
Electric	80
Machining	200
Assembly	100
Testing (conducted by machining department)	20

The company has included all these labor charges in the Asset Construction account. In addition, it included in the account the repairs and maintenance charges of \$1,340 that it incurred as a result of the malfunction.

#### Required

1. Compute, in accordance with generally accepted accounting principles, the amount that Olson Machine Company should capitalize for the milling machine as of December 31, 2007 when it declares the machine operational.
2. Identify the costs you included in Requirement 1 for which there are acceptable alternative procedures. Describe the alternative procedure(s) in each case.

**P10-5 Acquisition Cost** The following transactions of the Weber Company occurred during 2007:

1. The company acquired a tract of land in exchange for 1,000 shares of \$10 par value common stock. The stock was traded on the New York Stock Exchange at \$24 on the date of exchange. The land had a book value on the selling company's records of \$5,000, and it was believed to be worth "anything up to \$30,000."
2. An engine on a truck was replaced. The truck originally cost \$10,000 three years ago and was being depreciated at \$2,000 per year. The engine cost \$1,000 to replace.
3. The company acquired a tract of land that was believed to have mineral deposits by issuing 500 shares of preferred stock of \$50 par value. The preferred stock was rarely traded. The last transaction was two months earlier, when 50 shares were sold at \$75 per share. The owner of the land was willing to accept cash of \$55,000, and an appraisal had shown a value of \$60,000.
4. The company purchased a machine with a list price of \$8,500 by issuing a two-year \$10,000 non-interest-bearing note when the market rate of interest was 10%.

#### Required

Prepare journal entries to record the preceding events.

**P10-6 AICPA Adapted Comprehensive** At December 31, 2006 certain accounts included in the property, plant, and equipment section of the Townsend Company's balance sheet had the following balances:

Land	\$100,000	Leasehold improvements	\$500,000
Buildings	800,000	Machinery and equipment	700,000

During 2007, the following transactions occurred:

1. Land site number 621 was acquired for \$1,000,000. Additionally, to acquire the land Townsend paid a \$60,000 commission to a real estate agent. Costs of \$15,000 were incurred to clear the land. During the course of clearing the land, timber and gravel were recovered and sold for \$5,000.
2. A second tract of land (site number 622) with a building was acquired for \$300,000. The closing statement indicated that the land value was \$200,000 and the building value was \$100,000. Shortly after acquisition, the building was demolished at a cost of \$30,000. A new building was constructed for \$150,000 plus the following costs:

Excavation fees	\$11,000
Architectural design fees	8,000
Building permit fee	1,000

The building was completed and occupied on September 29, 2007.

3. A third tract of land (site number 623) was acquired for \$600,000 and was put on the market for resale.

4. Extensive work was done to a building occupied by Townsend under a lease agreement that expires on December 31, 2016. The total cost of the work was \$125,000, which consisted of the following:

Painting of ceilings	\$ 10,000 (estimated useful life is one year)
Electrical work	35,000 (estimated useful life is ten years)
Construction of extension to current working area	<u>80,000 (estimated useful life is thirty years)</u>
	<u>\$125,000</u>

The lessor paid one-half of the costs incurred in connection with the extension to the current working area.

5. During December 2007 costs of \$65,000 were incurred to improve leased office space. The related lease will terminate on December 31, 2009, and is not expected to be renewed.
6. A group of new machines was purchased under a royalty agreement which provides for payment of royalties based on units of production for the machines. The invoice price of the machines was \$75,000, freight costs were \$2,000, unloading charges were \$1,500, and royalty payments for 2007 were \$13,000.

#### Required

- Prepare a detailed analysis of the changes in each of the following balance sheet accounts for 2007:
 

Land	Leasehold improvements
Buildings	Machinery and equipment

 Disregard the related accumulated depreciation accounts.
- List the items in the fact situation which were not used to determine the answer to Requirement 1, and indicate where, or if, these items should be included in Townsend's financial statements.

**P10-7 Assets Acquired by Exchange** The Bremer Company made the following exchanges of assets during 2007:

- Acquired a more advanced machine worth \$10,000 by paying \$2,000 cash and giving a machine that had originally cost \$40,000 and has a book value of \$12,000.
- Acquired a building worth \$55,000 by paying \$5,000 cash and giving a piece of land that had originally cost \$35,000.
- Acquired a more advanced machine worth \$20,000 by paying \$5,000 cash and giving a machine that had originally cost \$13,000 and has a book value of \$11,000.
- Acquired a car by giving a truck that had originally cost \$20,000, has a book value of \$15,000, and has a "blue book" value of \$16,800. In addition the company received \$1,000 cash.

#### Required

Prepare the journal entry of the Bremer Company for each exchange.

**P10-8 Assets Acquired by Exchange** The Bussell Company exchanged the following assets during 2007:

- Acquired a newer machine by paying \$4,000 cash and giving a machine that originally cost \$40,000, has a book value of \$25,000, and is worth \$30,000.
- Same facts as in item 1, except that the asset being surrendered has a book value of \$33,000.
- Acquired a newer machine by giving a machine that originally cost \$45,000, has a book value of \$20,000, and is worth \$32,000. In addition \$5,000 cash was received.
- Same facts as in item 3, except that the asset being surrendered has a book value of \$36,000.
- Acquired a newer machine worth \$90,000 by giving up a machine of equal value. The machine surrendered had originally cost \$150,000 and has a book value of \$80,000.
- Same facts as in item 5, except that the asset being surrendered has a book value of \$94,000.
- Acquired a building in exchange for land that had originally cost \$130,000 and is now worth \$200,000.
- Same facts as in item 7, except that \$30,000 was paid.
- Same facts as in item 7, except that \$20,000 was received.

#### Required

Prepare the journal entry to record each acquisition of the Bussell Company.

**P10-9 Interest During Construction** The Alta Company is constructing a production complex which qualifies for interest capitalization. The following information is available:

Capitalization period: January 1, 2007 to June 30, 2009

Expenditures on project (incurred evenly during each period and excluding capitalized interest from previous years):

2007	\$2,000,000
2008	\$3,760,000
2009	\$4,324,000

Amounts borrowed and outstanding:

- \$3 million borrowed at 12%, specifically for the project
- \$6 million borrowed on July 1, 2003, at 14%
- \$14 million borrowed on January 1, 1999, at 8%

#### Required

1. Compute the amount of interest costs capitalized each year.
2. If it is assumed that the production complex has an estimated life of 20 years and a residual value of zero, compute the straight-line depreciation in 2010.
3. Explain the effects of the interest capitalization on the financial statements for all three years. Ignore income taxes.

**P10-10 Comprehensive** The Foothills Power Company begins a two-year construction project on a power plant on January 1, 2007. The following information is available:

1. The company borrows \$10 million on January 1, 2007 at 12%, specifically for use on the project.
2. The company's other borrowings are:
  - \$20 million at 10%
  - \$60 million at 8%
3. The expenditures for the project, incurred evenly each year (excluding capitalized interest from previous years), are as follows:
  - \$6,000,000 in 2007
  - \$11,460,000 in 2008
  - \$1,800,000 in 2009
4. The project is completed on March 31, 2009. It took longer than originally planned because the company suspended construction for the last three months of 2007 because of a concern about the salability of the electricity produced by the plant.
5. Because of reduced demand for electricity, the plant does not begin operations until October 1, 2009.
6. The company invests at 11% the unused amounts of the \$10 million borrowed in item 1.
7. Assume all transactions are in cash unless otherwise indicated.

#### Required

1. Prepare all the necessary journal entries for each of the three years. Record all construction costs in a Construction in Progress inventory account.
2. How would your answer to Requirement 1 change if the three-month suspension in the construction activity was due to an environmental dispute with the federal government?

**P10-11 Events Subsequent to Acquisition** The following selected events occurred during 2007:

- Jan. 10 A motor breaks on a machine and is replaced for \$800. This replacement was expected when the machine was purchased.
- Jan. 24 A machine that was purchased for \$10,000 and has a book value of \$1,000 is sold for \$600.
- Feb. 3 A fully depreciated building that originally cost \$25,000 is demolished so that a new building may be constructed. The demolition cost \$2,200 and resulted in \$700 of salvageable materials.
- Feb. 14 A machine breaks down unexpectedly and requires repairs of \$700.
- Mar. 10 An accident damages some equipment. Repairs cost \$2,000.
- Mar. 19 A motor breaks on a machine and is replaced for \$900. The new motor is of an improved design that increases the capacity of the machine.
- Mar. 27 Office layout is rearranged at a cost of \$700. At the same time, the walls are repainted for \$500.

#### Required

Prepare journal entries for the preceding transactions.

**P10-12 AICPA Adapted Comprehensive** You are engaged in the examination of financial statements of the Dewoskin Company and are auditing the Machinery and Equipment account and the related depreciation accounts for the year ended December 31, 2007. Your permanent file contains the following schedules:

	Balance 12/31/05	2006 Retirements	2006 Addition	Balance 12/31/06
<i>Machinery and Equipment</i>				
1996	\$ 8,000	\$2,100	—	\$ 5,900
1997	400	—	—	400
1998	—	—	—	—
1999	—	—	—	—
2000	3,900	—	—	3,900
2001	—	—	—	—
2002	5,300	—	—	5,300
2003	—	—	—	—
2004	4,200	—	—	4,200
2005	—	—	—	—
2006	—	—	\$5,700	5,700
	<u>\$21,800</u>	<u>\$2,100</u>	<u>\$5,700</u>	<u>\$25,400</u>

	Balance 12/31/05	2006 Retirements	2006 Addition	Balance 12/31/06
<i>Accumulated Depreciation</i>				
1996	\$ 7,840	\$2,100	\$ 160	\$ 5,900
1997	340	—	40	380
1998	—	—	—	—
1999	—	—	—	—
2000	2,145	—	390	2,535
2001	—	—	—	—
2002	1,855	—	530	2,385
2003	—	—	—	—
2004	630	—	420	1,050
2005	—	—	—	—
2006	—	—	285	285
	<u>\$12,810</u>	<u>\$2,100</u>	<u>\$1,825</u>	<u>\$12,535</u>

Here is a transcript of the Machinery and Equipment account for 2007:

2007	Machinery and Equipment	Ref.	Debit	Credit
Jan. 1	Balance forward		\$25,400	
Mar. 1	Burnham grinder	VR	1,200	
May 1	Air compressor	VR	4,500	
June 1	Power lawnmower	VR	600	
June 1	Lift-truck battery	VR	320	
Aug. 1	Rockwood saw	CR		\$ 150
Nov. 1	Electric spot welder	VR	4,500	
Nov. 1	Baking oven	VR	2,800	
Dec. 1	Baking oven	VR	236	
			<u>\$39,556</u>	<u>150</u>
Dec. 31	Balance			<u>\$39,406</u>
			<u>\$39,556</u>	<u>\$39,556</u>

Your examination reveals the following eight items:

1. The company uses a 10-year life for all machinery and equipment for depreciation purposes. Depreciation is computed by the straight-line method. Six months' depreciation is recorded in the year of acquisition or retirement. For 2007 the company recorded depreciation of \$2,800 on machinery and equipment.

- The Burnham grinder was purchased for cash from a firm in financial distress. The chief engineer and a used machinery dealer agreed that the machine, which was practically new, was worth \$2,100 in the open market.
- For production reasons, the new air compressor was installed in a small building that was erected in 2007 to house the machine. The building will also be used for general storage. The cost of the building, which has a 25-year life, was \$2,000 and is included in the \$4,500 voucher for the air compressor.
- The power lawnmower was delivered to the home of the company president for personal use.
- On June 1, the battery in a battery-powered lift truck was accidentally damaged beyond repair. The damaged battery was included at a price of \$600 in the \$4,200 cost of the lift truck purchased on July 1, 2004. The company decided to rent a replacement battery instead of buying a new battery. The \$320 expenditure is the annual rental for the battery paid in advance, net of a \$40 allowance for the scrap value of the damaged battery that was returned to the battery company.
- The Rockwood saw sold on August 1 had been purchased on August 1, 1994, for \$1,500. The saw was in use until it was sold.
- On September 1, the company determined that a production casting machine was no longer needed and advertised it for sale for \$1,800 after having determined from a used machinery dealer that this was its market value. The casting machine had been purchased for \$5,000 on September 1, 2002.
- On November 1 a baking oven was purchased for \$10,000. A \$2,800 down payment was made, and the balance will be paid in monthly installments over a three-year period. The December 1 payment includes interest charges of \$36. Legal title to the oven will not pass to the company until the payments are completed.

#### Required

- Prepare the auditor's adjusting journal entries required on December 31, 2007, for machinery and equipment and the related depreciation.
- Prepare schedules for detailing the effect of additions and retirements on the assets and related accumulated depreciation balances.

**P10-13 AICPA Adapted** *Adjusting Entries* In your examination of the financial statements of Ericson Corporation at December 31, 2007 you observe the contents of certain accounts and other pertinent information as follows:

Date	Explanation	Building Post REF	Debit	Credit	Balance
12/31/06	Balance	X	\$100,000	—	\$100,000
7/1/07	New boiler	CD	16,480	\$1,480	115,000
9/1/08	Insurance recovery	CR	—	2,000	113,000

Date	Explanation	Accumulated Depreciation—Building LF	Debit	Credit	Balance
12/31/06	Balance: 15 years @ 4% of \$100,000 (no salvage value)	X		\$60,000	\$60,000
12/31/07	Annual depreciation	GJ		4,440	64,440

You learn that on June 15 the company's old high-pressure boiler exploded and was partially damaged. Damage to the building was insignificant, but the boiler was replaced by a more efficient oil-burning boiler. The company received \$2,000 as an insurance adjustment under terms of its policy for damage to the boiler. The disbursement voucher charged to the Building account on July 1, 2007 is reproduced here:

To: Leetsdale Heating Company	
Fair value—new oil-burning boiler (including fuel oil tank and 1,000 gallons fuel oil)	\$16,000
Sales tax—3% of \$16,000	480
Total	\$16,480
Less: Allowance (fair value) for old coal-burning boiler in building—to be removed at the expense of the Leetsdale Heating Company	1,480
Total price	<u>\$15,000</u>

In vouching the expenditure, you determine that the terms included a 2% cash discount that was properly computed and taken. Neither the sales tax nor the trade-in allowance on the old boiler is subject to discount. Your audit discloses that a voucher for \$1,000 was paid to Monaco Company on July 3, 2007 and charged to the Repair Expense account. The voucher is adequately supported and is marked "installation costs for new oil-burning boiler."

The company's fuel oil supplier advises that fuel oil had a market price of 80 cents per gallon on July 1 and 85 cents per gallon on December 31. The fuel oil inventory at December 31 was 100 gallons.

A review of subsidiary property records discloses that the replaced coal-burning boiler was installed when the building was constructed and was recorded at a cost of \$10,000. According to its manufacturers, the new boiler should be serviceable for the estimated useful life of the building.

In computing depreciation for retirements, Ericson Corporation consistently treats a fraction of a month as a full month.

**Required**

Prepare the adjusting journal entries that you would suggest for entry on the books of the Ericson Corporation. The books have not been closed. Support your entries with computations in good form. Assume that the building has no salvage value.

**P10-14 Oil and Gas Accounting Methods (Appendix)** The Iwata Oil Company incurred costs of \$6 million during 2007 drilling for oil. Half the costs resulted in oil being found and half resulted in dry wells. The company expects the oil wells to produce 10% of their capacity each year from 2008 to 2017.

**Required**

1. What amounts appear in the financial statements for 2008 under
  - a. The successful-efforts method?
  - b. The full-cost method?
2. Why do small oil companies generally prefer the full-cost method?

## CASES

### COMMUNICATION

#### C10-1 Acquisition and Retirement

**AICPA Adapted** Among the principal topics related to the accounting for property, plant, and equipment of a company are acquisition and retirement.

**Required**

1. Explain the expenditures that a company capitalizes when it acquires equipment for cash.
2. Assume that a company cannot determine the market value of equipment acquired by reference to a similar purchase for cash. Explain how the company determines the capitalizable cost of equipment purchased by exchanging it for each of the following three items:
  - a. Bonds having an established market price.
  - b. Common stock not having an established market price.
  - c. Similar equipment having a determinable market value.
3. Explain the factors that a company uses to determine whether it capitalizes expenditures relating to property, plant, and equipment already in use.
4. Explain how a company accounts for the gain or loss on the sale of property, plant, and equipment for cash.

#### C10-2 Capitalization Issues

**AICPA Adapted** George Company purchased land for use as its corporate headquarters. A small factory that was on the land when it was purchased was torn down before construction of the office building began. Furthermore, a substantial amount of rock blasting and removal had to be done to the site before construction of the building foundation began. Because the office building was set back on the land, far from the public road, George Company had the contractor construct a paved road that led from the public road to the parking lot of the office building.

Three years after it occupied the office building, George Company added four stories to the office building. The four stories had an estimated useful life of five years more than the remaining estimated useful life of the original office building.

Ten years later George Company sold the land and building at an amount more than their book value and had a new

office building constructed in another state for use as its new corporate headquarters.

**Required**

1. Which of the preceding expenditures does the company capitalize? How does it depreciate or amortize each? Explain the rationale for your answers.
2. How does a company account for the sale of the land and building? Include in your answer how to determine the book value at the date of sale. Explain the rationale for your answer.

#### C10-3 Cost Issues

**AICPA Adapted** Deskin Company purchased a new machine to be used in its operations. The new machine was delivered by the supplier, installed by Deskin, and placed into operation. It was purchased under a long-term payment plan for which the interest charges approximated the prevailing market rates. The estimated useful life of the new machine is 10 years, and its estimated residual (salvage) value is significant. Normal maintenance was performed to keep the new machine in usable condition.

Deskin also added a wing to the manufacturing building that it owns. The addition is an integral part of the building. Furthermore, Deskin made significant leasehold improvements to office space used as corporate headquarters.

**Required**

1. What costs should Deskin capitalize for the new machine?
2. Explain how Deskin should account for the normal maintenance performed on the new machine.
3. Explain how Deskin should account for the wing added to the manufacturing building. Where should the added wing be reported on Deskin's financial statements?
4. Explain how Deskin should account for the leasehold improvements made to its office space. Where should the leasehold improvements be reported on Deskin's financial statements?

### C10-4 Acquisition Costs

**AICPA Adapted** A company may acquire plant assets (among other ways) for cash, on a deferred-payment plan, by exchanging other assets, or by a combination of these ways.

#### Required

1. Identify six costs that a company should capitalize as the cost of land. For your answer, assume that a company acquires land with an existing building for cash and that it removes the existing building immediately in order that it can construct a new building on that site.
2. At what amount should a company record a plant asset acquired on a deferred-payment plan?
3. In general, at what amount should a company record plant assets received in exchange for other nonmonetary assets? Specifically, at what amount should a company record a new machine acquired by exchanging an older, similar machine and paying cash? What amount should it recognize as a gain or loss?

### C10-5 Capital and Revenue Expenditures

**AICPA Adapted** Bristol Company purchased land as a site for construction of a factory. Outside contractors were engaged to:

1. Construct the factory
2. Grade and pave a parking lot adjacent to the factory for the exclusive use of the factory workers.

Operations at the new location began during the year and normal factory maintenance costs were incurred after production began.

#### Required

1. Distinguish between capital and revenue (operating) expenditures.
2. Indicate how the company should account for and report expenditures for each of the following at the time incurred and in subsequent accounting periods.
  - a. Purchase of land
  - b. Construction of factory
  - c. Grading and paving parking lot
  - d. Payment of normal factory maintenance costs

Do not discuss capitalization of interest during construction in your response.

## CREATIVE AND CRITICAL THINKING

### C10-6 Lump-Sum Acquisition

In 1975 a trial was held to settle a tax dispute between the owners of the **Atlanta Falcons**, a National Football League franchise, and the Internal Revenue Service. In 1966, the owners had paid \$8.5 million to purchase the franchise. They considered \$50,000 to be the cost of the franchise (which is not depreciable for income tax reporting), \$727,000 was deferred interest, and the remaining \$7.7 million was claimed to be the cost of the players' contracts and options. The dispute centered on several variables:

1. How much of the purchase price was assignable to television rights?
2. Is the value assignable to television rights depreciable? If so, what is the expected life?
3. How much of the purchase price was assignable to player contracts and options?
4. Over what life should the value assigned to the players be depreciated?
5. What is the value of the franchise?

#### Required

1. As an independent accountant, explain the approach you would take and the information you would need to provide advice to the court for the resolution of the points in dispute.
2. Do these valuation issues also create ethical issues?

### C10-7 Interest Capitalization

The Gold Creek Company has borrowed large amounts of money to purchase 5,000 acres of land, which it will develop as a new ski area over the next 10 years. Development is currently

under way on the first 2,000 acres, with trails being cut and ski lifts being built. When the company completes this initial development after four years, it will develop the remaining acreage at the rate of approximately 500 acres per year. The company also used some of the money it borrowed to purchase adjacent land, which it will use to expand the ski area if it is successful.

Since this is the first year of the company's existence, it has not developed a policy about interest capitalization. Specifically, it is uncertain about whether it is entitled to capitalize interest on the amounts borrowed to acquire the first 2,000 acres, the total 5,000 acres, the 5,000 acres plus the adjacent land, or the land and the development.

#### Required

1. Explain the interest capitalization that is appropriate under these circumstances.
2. How might the decision be influenced if the company were interested in earnings management?

### C10-8 Purchase Options

The Morgan Company was planning to expand its production facilities. Therefore it acquired one-year options to purchase two alternative sites. Each option cost \$5,000 and could not be applied against the contract. One of the sites was bought for \$100,000. The company was unsure whether to capitalize the land at \$100,000, \$105,000, or \$110,000.

#### Required

Write a short report that presents arguments in favor of each alternative.

### C10-9 Donated Asset and Its Modification

The Birkby Company acquires a building as a donation from the City of Avalon. The controller argues that since there was no payment by the company, it is not necessary to record the asset and therefore no depreciation should be recorded.

The company has to spend \$15,000 altering the building to suit its unique needs. The controller argues that the \$15,000 should be expensed because if the building is sold or returned to the city, it cannot recover the \$15,000. In addition, expensing the \$15,000 results in a closer approximation of the apparent market value of the asset and reduces income taxes immediately.

#### Required

Write a short memo to the controller that evaluates each of the arguments made by the controller.

### C10-10 Natural Resource Assets

**AICPA Adapted** You have been engaged to examine the financial statements of Brahe Corporation for the year ending December 31, 2007. Brahe Corporation was organized in January 2007 by Messrs. Moses and Price, original owners of options to acquire oil leases on 5,000 acres of land for \$350,000. They expected that first the oil leases would be acquired by the corporation and subsequently 180,000 shares of the corporation's common stock would be sold to the public at \$6 per share. In February 2007 they exchanged their options, \$150,000 cash, and \$50,000 of other assets for 75,000 shares of common stock of the corporation. The corporation's board of directors appraised the leases at \$600,000, basing its appraisal on the price of other acreage recently leased in the same area. The options were therefore recorded at \$250,000 (\$600,000 – \$350,000 option price).

The options were exercised by the corporation in March 2007 prior to the sale of common stock to the public in April 2007. Leases on approximately 500 acres of land were abandoned as worthless during the year.

#### Required

1. Explain why the valuation of assets acquired by a corporation in exchange for its own common stock is sometimes difficult.
2. a. Explain the reasoning Brahe Corporation might use to support valuing the leases at \$600,000, the amount of the appraisal by the board of directors.  
b. Assuming the board's appraisal was sincere, what steps might Brahe Corporation have taken to strengthen its position to use the \$600,000 value and to provide additional information if questions were raised about possible overvaluation of the leases?
3. Discuss the propriety of charging one-tenth of the recorded value of the leases against income at December 31, 2007 because leases on 500 acres of land were abandoned during the year.

### C10-11 Ethics and Construction Costs

You are the accountant for a division of a company that is constructing a building for its own use. It is January 2008, and you are working on closing the books for 2007. The CEO of the division stops by your office and says, "I have some questions about our building. Although we started construction at the beginning of June this year, we started planning it at the beginning of the previous year. I believe that we can capitalize interest since then. Check to see if we did capitalize some in 2006. If not, we can take it out of this year's expense and get a double dose. Also, I want you to add lots of overhead to the cost of the building so we can increase our profit for this year. For example, you spent quite a bit of time on the project. So perhaps we could add 1/12 of your salary to the cost of the building. You get the idea?" When the CEO leaves, you check the files and find a letter to an architect dated January 2, 2006. There are numerous subsequent letters to and from the architect.

#### Required

From financial reporting and ethical perspectives, how would you reply to the CEO?

## RESEARCH SIMULATIONS

### R10-1 Researching GAAP

#### Situation

The Tenth National Bank had taken possession of a shopping mall in foreclosure of a mortgage. When the mall was inspected prior to being sold by the bank to a real estate company, it was discovered that it had extensive asbestos problems. An estimate indicated that it would cost \$1 million to remove the asbestos. The bank has also purchased an office building for its headquarters. The building was inspected before the purchase and a similar asbestos problem was

discovered. An estimate indicated that it would cost \$2 million to remove the asbestos, and the bank completed the purchase. The bank's president has asked you how to account for these transactions.

#### Directions

1. Research the related generally accepted accounting principles and prepare a short memo to the president that answers her question. Cite your references and applicable paragraph numbers.
2. Does this situation create ethical issues?

## R10-2 Researching GAAP

### Situation

The Perry Park Company (a privately-held company) was searching for a way to expand its operating capacity even though it was short of cash. The president of the company was playing golf and mentioned his concern to his playing partner, who owned some land and a building, and was interested in disposing of them. After some negotiation, the two agreed to swap the land and building for shares in the company. The president of the company has asked you

how to account for this transaction, including whether the transaction qualifies as an exception to the general rule to use fair value and the value to place on the transaction and its components.

### Directions

1. Research the related generally accepted accounting principles and prepare a short memo to the president. Cite your references and applicable paragraph numbers.
2. Does this situation create ethical issues?

## OBJECTIVES

After reading this chapter, you will be able to:

- 1 Identify the factors involved in depreciation.
- 2 Explain the alternative methods of cost allocation, including time-based and activity-based methods.
- 3 Record depreciation.
- 4 Explain the conceptual issues regarding depreciation methods.
- 5 Understand the disclosure of depreciation.
- 6 Understand additional depreciation methods, including group and composite methods.
- 7 Compute depreciation for partial periods.
- 8 Explain the impairment of property, plant, and equipment.
- 9 Understand depreciation for income tax purposes.
- 10 Explain changes and corrections of depreciation.
- 11 Understand and record depletion.

## Depreciation and Depletion

### The Financial Effect of Impairments

Accounting for property, plant, and equipment involves many choices that affect the balance sheet and the income statement, but perhaps no choice involving property, plant, and equipment has generated as much regulatory scrutiny as the decision to record asset impairments. Under U.S. accounting standards, companies are required to evaluate their property, plant, and equipment when events or circumstances indicate that an asset may be impaired. For example, in November 2004, **DirecTV** announced that it was taking a \$1.47 billion write-down because of the company's decision to use several new satellites for high-definition TV broadcasting rather than their intended use to deliver Internet service. In DirecTV's third-quarter press release, this write-down was listed as a contributing factor to the company's quarterly loss of \$1.01 billion.

Because impairments produce conservative financial results (income is reduced and asset values lowered), why would asset impairment accounting be a focus of the Securities and Exchange Commission? One concern is that companies often take large

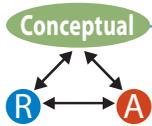

Credit: Associated Press, AP

write-downs to help their future earnings. When an asset impairment charge is taken, there is often very little of the asset's book value left to depreciate in future periods. For example, the book value of the DirecTV satellites was approximately \$1.9 billion prior to the impairment. After the impairment loss, the remaining book value to be depreciated was \$430 million, approximately 23% of the assets' original book value. Given a useful life of 12 to 16 years for satellites, as disclosed in DirecTV's annual report, the asset impairment taken by DirecTV will reduce depreciation expense by approximately \$90 million to \$120 million per year. With financial statement effects of this size, the SEC and investors will certainly take notice.

### FOR FURTHER INVESTIGATION

For a discussion of asset impairments, consult the Business & Company Resource Center (BCRC):

- The Perils of Impairment. Daniel Berninger, *Telephony*, 0040-2656, Jan 31, 2005, v245, i2.

In Chapter 10, we described property, plant, and equipment as a group of assets held by a company for use for a period of more than one year. That is, the company acquired the assets for their long-term revenue-generating ability. Since the company uses these assets to earn revenue, the matching principle requires that the company match the expenses of the assets' use against the revenue. Over the life of the asset, the expense is the difference between the purchase price of the asset and its residual value (that is, future selling price).

**Depreciation is the process of allocating in a systematic and rational manner this total expense to each period benefited by the asset.** Land is not depreciated because it generally does not have a limited life and its residual value usually is higher than its cost. Thus, there is no expense to be recognized over the life of the asset and, therefore, no periodic cost allocation.

Terms used to describe this allocation process depend on the type of asset:

1. **Depreciation** is the allocation of the cost of *tangible assets*, such as property, plant, and equipment.
2. **Depletion** is the allocation of the cost of *natural resource assets*, such as oil, gas, minerals, and timber.
3. **Amortization** is the allocation of the cost of *intangible assets*, such as patents and copyrights. It may be used as a general term to describe the periodic allocation of costs; in that case, it is synonymous with depreciation and depletion.

These three terms all describe the same principle of a company allocating costs to match its expenses with revenue. However, they differ in their application to different types of assets. It is important to note that a company does *not* record depreciation, depletion, and amortization in an attempt to report the fair value of the asset. We discuss depreciation and depletion in this chapter, and the amortization of intangible assets in the next chapter.

## FACTORS INVOLVED IN DEPRECIATION

A company considers four factors in the computation of depreciation for a period:

- Asset cost
- Service life
- Residual value
- Method of cost allocation<sup>1</sup>

### Asset Cost

The cost of an asset includes all the acquisition costs a company incurs to obtain the benefits from the asset. These costs include the contract price plus freight, assembly, installation, and testing costs, as we discussed in Chapter 10.

### Service Life

The service life of an asset is the measure of the service units a company expects from the asset before its disposal. Service life may be measured in *units of time*, such as years and months, or *units of activity or output*, such as hours of operation of a machine, tons produced for a steel mill, or miles driven for a truck.

1 Identify the factors involved in depreciation.

1. The service life, residual value, and method of cost allocation are different for income tax purposes under the Modified Accelerated Cost Recovery System (MACRS), as we discuss later in the chapter.

The factors that limit the service life of an asset can be divided into two general categories:

- **Physical causes include wear and tear because of operational use, deterioration and decay that is independent of use but is a function of time (such as rust), and damage and destruction.**
- **Functional causes limit the service life of the asset through obsolescence and inadequacy, even though the physical life is not exhausted.**

*Obsolescence* is common in a technologically advanced economy when an asset becomes obsolete because of new technology. *Inadequacy* refers to the situation in which an asset is no longer suitable for the size of the company's operations. For example, a warehouse may be physically sound and useful, but too small for the company's operations.

When a company estimates the service life, it should consider all these factors because in many situations the service life is affected by a combination of factors. For example, the service life of a truck is likely to be affected by the passage of time (deterioration, decay, and possibly obsolescence) as well as by the amount of use. In addition, the company may be able to increase or decrease the service life by the amount it spends on repairs and maintenance as well as on improvements and replacements. You will have to rely on others, such as engineers, for advice about such estimates, but will still have to make your own judgment.

## Residual Value

The residual (salvage) value is the net amount that a company expects to obtain from disposing of an asset at the end of its service life. It is the expected value of the asset at the end of its service life minus the costs of disposal, such as dismantling, removing, and selling the asset. The service life and the residual value are determined by company policy. A company may plan to hold an asset until it is physically exhausted or functionally obsolete and not useful to anyone else. Then, the expected residual value is the expected scrap value, which is probably very low. Alternatively, a company may plan to dispose of the asset when it still has considerable economic usefulness to others (the service life to the company is less than the physical life). Then, the expected residual value is the estimated net market value of the asset (the selling price less the disposal costs) at the time of the disposal, which may be relatively high. For example, many airlines sell their planes long before the end of their physical lives to replace them with technologically more advanced planes and to avoid passenger resistance to flying in old planes. In some situations, such as a nuclear power plant, the acquisition of an asset automatically creates an obligation related to the retirement of the asset. As we discussed in Chapter 10, a company computes the present value of the obligation and adds the same amount to the cost of the asset.

In practice, because the residual value is difficult to estimate, it often is ignored in computing the depreciation amount, or else a standard rate, such as 10% of original cost, is used. This practice is acceptable if it does not have a material effect on the measurement of income and the book value of the asset.

## METHODS OF COST ALLOCATION

Accounting principles require that a company use a method of cost allocation that is "systematic and rational."<sup>2</sup> *Systematic* means that the calculation should follow a formula and not be determined in an arbitrary manner. *Rational* means that the amount of the depreciation should relate to the benefits that the asset produces in each period.

**2** Explain the alternative methods of cost allocation, including time-based and activity-based methods.

2. *Accounting Terminology Bulletin No. 1* (New York: AICPA, 1953), par. 56.

Although these criteria may appear to be very general and to allow numerous methods, only the following methods are used frequently in practice:

1. Time-based methods
  - a. Straight line
  - b. Accelerated (declining charge)
    - (1) Sum of the years' digits
    - (2) Declining balance
2. Activity (or use) methods

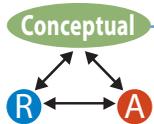

We discuss each of these methods in the following sections, using the data for the Troup Company shown in Example 11-1. **The depreciation base (depreciable cost) of the asset is the cost less the estimated residual value, or \$100,000.** The different depreciation methods all allocate the total of \$100,000 over the expected service life of the asset. However, they differ in the pattern in which the cost is allocated to each year or each unit produced. We discuss additional special depreciation methods later in the chapter.

#### EXAMPLE 11-1 Asset Information of the Troup Company

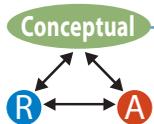

Asset cost	\$120,000
Date of purchase	January 1, 2006
Estimated residual value	\$20,000
Estimated service life	5 years; 10,000 hours; 20,000 units

### Time-Based Methods

A company should use a time-based method when the service life of the asset is affected primarily by the passage of time and not by the use of the asset. This situation includes the physical causes of deterioration and decay and the functional causes of obsolescence and inadequacy. Two general categories of time-based methods are the straight-line method and the accelerated methods. **The straight-line method is appropriate when a company estimates that the benefits it will derive from the asset will be approximately constant each period of its life.** Since straight-line depreciation is the same each period, the matching principle is satisfied because the company matches, as an expense, an equal cost each period against benefits that are approximately the same each period. The straight-line method is appropriate if maintenance costs are expected to be the same each period. Then the total costs of depreciation and maintenance each period are equal and matched against benefits that are approximately the same each period.

**The accelerated (or declining-charge) methods are appropriate when a company estimates that the benefits it will derive from the asset will decline each period.** Thus, the accelerated methods match a depreciation cost that declines each period against revenues that also are declining each period. The benefits to be derived from the asset may be measured in physical terms or in dollars of revenue, as we discuss later. The choice of a particular accelerated method is basically arbitrary. This is because, in most situations, the particular declining depreciation amount of each method cannot be matched against the expected pattern of declining revenue. The estimates required cannot be that accurate. Instead, the general principle is that if declining benefits are expected, then an accelerated (declining-charge) method is selected.

### Straight Line

**The straight-line method allocates an equal cost to each period.** For the Troup Company, we show the calculation in Example 11-2. The depreciation base of \$100,000 is allocated equally to the estimated life of five years at the rate of \$20,000 per year. The straight-line depreciation sometimes is expressed as a percentage of original cost

(\$20,000 ÷ \$120,000 = 16.67%) or of depreciable cost (\$20,000 ÷ \$100,000 = 20%). Although widely adopted, the use of the straight-line method may be criticized because it often is used for convenience when an activity method would be more appropriate.

#### EXAMPLE 11-2 Straight-Line Depreciation

Year	Book Value of Asset at Beginning of Year	Depreciation	Book Value of Asset at End of Year <sup>b</sup>
2006	\$120,000	\$20,000 <sup>a</sup>	\$100,000
2007	100,000	20,000	80,000
2008	80,000	20,000	60,000
2009	60,000	20,000	40,000
2010	40,000	20,000	20,000

$$\begin{aligned} \text{aDepreciation} &= \frac{\text{Cost} - \text{Residual Value}}{\text{Service Life}} \\ &= \frac{\$120,000 - \$20,000}{5} \\ &= \underline{\underline{\$20,000 \text{ per year}}} \end{aligned}$$

<sup>b</sup> Cost minus depreciation; in 2006, \$120,000 – \$20,000

#### Sum of the Years' Digits

The sum-of-the-years'-digits method produces declining depreciation each period by applying a declining fraction each year to the depreciation base. The denominator of the fraction is the sum of the years' digits. So, for an asset with a five-year life, the sum is  $5 + 4 + 3 + 2 + 1 = 15$ .<sup>3</sup> The numerator of the fraction is the years' digits taken in reverse order—that is, 5 the first year, 4 the second year, etc. An alternative way of looking at the numerator is that it is the number of years remaining in the asset's life as of the *beginning* of the year. The fractions for the five years of the asset's life are 5/15, 4/15, 3/15, 2/15, and 1/15. We show the calculation of the depreciation for the Troup Company in Example 11-3. Each year, the depreciation declines, and at the end of the fifth year, the book value of the asset is equal to the estimated residual value of \$20,000. Note that in this method, the depreciation base remains constant, while the fraction decreases each year.

#### EXAMPLE 11-3 Sum-of-the-Years'-Digits Depreciation

Year	Depreciation Base	Fraction	Depreciation	Book Value of Asset at End of Year*
2006	\$100,000	5/15	\$ 33,333	\$86,667
2007	100,000	4/15	26,667	60,000
2008	100,000	3/15	20,000	40,000
2009	100,000	2/15	13,333	26,667
2010	100,000	1/15	6,667	20,000
			<u>\$100,000</u>	

\*Cost minus accumulated depreciation; in 2006, \$120,000 – \$33,333

3. The general formula to compute the sum of the years' digits is  $n(n + 1)/2$ . So, for an asset with a 50-year life, the sum is  $50(50 + 1)/2 = 1,275$ .

### Declining Balance

The declining-balance methods produce a declining depreciation amount each period by applying a *constant* rate to the book value of the asset at the beginning of the period. Note that the periodic depreciation declines because the book value is used and *not* the depreciation base. Also, the residual value is ignored in the calculation of the depreciation each period. However, the asset is not depreciated below the estimated residual value. The constant rate is a function of the straight-line rate. The highest rate that can be used is double the straight-line rate. This rate was established as the highest rate by the income tax regulations and was also adopted as the highest rate for financial reporting. An asset that has a five-year life is depreciated on a straight-line basis at the rate of 20% per year, so the double-declining rate is 40%. However, an alternative rate could be chosen, such as a 150% declining rate, which is 1½ times the straight-line rate or, in this example, 30% per year. We show both alternatives for the Troup Company in Example 11-4.

#### EXAMPLE 11-4 Declining-Balance Depreciation Methods

##### (a) Double-Declining-Balance

Year	Book Value of Asset at Beginning of Year	Rate	Depreciation	Book Value of Asset at End of Year
2006	\$120,000	40%	\$ 48,000	\$72,000
2007	72,000	40%	28,800	43,200
2008	43,200	40%	17,280	25,920
2009	25,920	—	5,920	20,000
2010	20,000	—	—	20,000
			<u>\$100,000</u>	

##### (b) 150%-Declining-Balance

Year	Book Value of Asset at Beginning of Year	Rate	Depreciation	Book Value of Asset at End of Year
2006	\$120,000	30%	\$ 36,000	\$84,000
2007	84,000	30%	25,200	58,800
2008	58,800	30%	17,640	41,160
2009	41,160	30%	12,348	28,812
2010	28,812	—	8,812	20,000
			<u>\$100,000</u>	

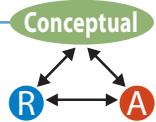

Note the special situations that arise toward the end of the asset's life. Under the double-declining-balance method, the book value at the beginning of 2009 is \$25,920. A strict application of the 40% rate would result in depreciation of \$10,368 ( $\$25,920 \times 40\%$ ). However, this would reduce the book value below the estimated residual value. Therefore, the 2009 depreciation is only \$5,920, which reduces the \$25,920 book value to the \$20,000 residual value, and there is no depreciation in 2010. A similar issue arises under the 150%-declining-balance method. Applying the 30% rate in 2010 would result in depreciation of \$8,643.60 ( $\$28,812 \times 30\%$ ), which would not reduce the book value to the residual value. Consequently, the depreciation in 2010 is \$8,812, which reduces the book value to the \$20,000 residual value.

Many companies avoid these problems by switching from the declining-balance method to the straight-line method during the life of the asset. The change in the

depreciation method might be made at the midpoint of the life of the asset, or when the depreciation under the straight-line method exceeds the declining-balance depreciation. Either method is systematic and rational if the company decides on the policy at the time of purchase and applies it to all assets. In addition, this practice avoids the possible distortion in the depreciation in the last years of the asset's life. The depreciation under this procedure probably will not be materially different from the continued application of the accelerated method.<sup>4</sup>

### Activity Methods

A company should use an activity method when the service life of the asset is affected primarily by the amount the asset is used and not by the passage of time. The activity usually is measured in terms of the number of hours worked or the output produced (such as miles driven or tons produced). In the case of the Troup Company, one measure of the life of the asset is estimated to be 10,000 hours of activity. We show the calculation of the depreciation per hour in Example 11-5.

#### EXAMPLE 11-5 Depreciation Based on Activity

$$\begin{aligned} \text{Depreciation Rate} &= \frac{\text{Cost} - \text{Residual Value}}{\text{Total Lifetime Activity Level}} \\ &= \frac{\$120,000 - \$20,000}{10,000 \text{ hours}} \\ &= \underline{\underline{\$10 \text{ per hour}}} \end{aligned}$$

The depreciation base of \$100,000 is divided by the life of 10,000 hours to derive a depreciation rate of \$10 per hour. The total depreciation for the period is determined by multiplying the depreciation rate by the number of hours the asset is used in the period. For example, if the Troup Company uses the asset for 2,100 hours during 2006, the depreciation for the year is \$21,000 (\$10 × 2,100).

It is important to note that this application of the activity method has produced a constant depreciation rate per *hour*, but one that varies per *unit* of production as the output per hour changes. For example, if the company produces 2 units per hour, the depreciation cost per unit is \$5. If productivity increases so that the company produces 2.5 units per hour, the depreciation cost per unit is \$4, although the depreciation per hour remains at \$10. In contrast, if the activity method is based on the number of *units* expected to be produced over the life of the asset, then a depreciation rate is developed that is constant per *unit* produced but would vary per *hour* as productivity changes. For example, if the depreciation is based on the expected lifetime production of 20,000 units, the depreciation rate is \$5 per unit produced (\$100,000 ÷ 20,000). If productivity

4. Another depreciation method also solves the issue of computing the correct amount of depreciation in the last year of an asset's life. It is the **fixed-percentage-of-declining-balance method**, in which a percentage depreciation rate is calculated that is multiplied by the book value to reduce it to the residual value at the end of the service life. The depreciation rate is calculated as follows:

$$\text{Depreciation Rate} = 1 - n \sqrt[n]{\frac{\text{Residual Value}}{\text{Cost}}}$$

where  $n$  is the life of the asset. (The residual value cannot be zero because that makes the fraction zero and the depreciation rate 100%.) The Troup Company would compute the rate as follows:

$$\text{Depreciation Rate} = 1 - 5 \sqrt[5]{\frac{\$20,000}{\$120,000}} = 0.3012$$

This method is rarely used in practice because of its complexity.

increases so that the company produces 2.5 units per hour, the depreciation cost per unit remains at \$5, but the depreciation per hour increases to \$12.50.

Although an activity method is appropriate for many assets because their lives are limited by physical causes, it often is not used because of the difficulty of estimating the lifetime units of activity. Also it would be a costly method to implement because of the need to measure and record the activity level of each asset each period. However, it is the method used for depletion, as we discuss later in the chapter.

# 1 3

## LINK TO RATIO ANALYSIS

While most U.S. companies use straight-line depreciation, they use varying estimates of service lives and residual values, which makes intercompany comparisons much more difficult. However, the required disclosures can be used by analysts to gain insights into a company's property, plant, and equipment. A useful measure that can be computed is the average age of a company's fixed assets. Consider the following data from **Intel's** 2004 annual report.

(in millions)	2004	2003
Accumulated Depreciation	\$24,065	\$22,031
Depreciation Expense	4,590	4,651
Depreciation Method	Straight-line	

Based on this information, the average age of Intel's property, plant, and equipment can be computed as follows:

$$\text{Average Age}_{2004} = \frac{\text{Accumulated Depreciation}}{\text{Depreciation Expense}} = \frac{\$24,065}{\$4,590} = 5.2 \text{ years}$$

$$\text{Average Age}_{2003} = \frac{\text{Accumulated Depreciation}}{\text{Depreciation Expense}} = \frac{\$22,031}{\$4,651} = 4.7 \text{ years}$$

Based on the above analysis, it appears that the average age of Intel's assets has increased slightly during 2004. Analysts may monitor this trend for three reasons. First, the age of a company's assets affects its competitive position since old assets tend to be less efficient than newer assets. Second, the age of assets provides an indication of a company's capital replacement policy and assists analysts in estimating future capital expenditures. Third, all things being equal, a company's return on assets will increase as the company's assets get older, which may affect the company's perceived profitability.

## RECORDING DEPRECIATION

### 3 Record depreciation.

It is important to note that a company may not expense all its depreciation cost in the period. A company includes depreciation on manufacturing assets as a cost of the inventory produced and records the depreciation as an increase (debit) to the Work in Process Inventory account. In other words, the company capitalizes the depreciation to inventory rather than expensing it directly. Costs incurred during the period either remain in the inventory accounts, Work in Process and Finished Goods Inventory, or they are included in Cost of Goods Sold. Only the portion of the total depreciation included in the units sold appears in the company's income statement as part of the cost of goods sold (and not separately as depreciation expense). Consequently, depreciation included in the cost of the units produced but not sold is part of the two inventory accounts on the company's balance sheet. Therefore, when a company sells in the current period units produced in previous periods, its cost of goods sold includes some depreciation cost from previous periods.

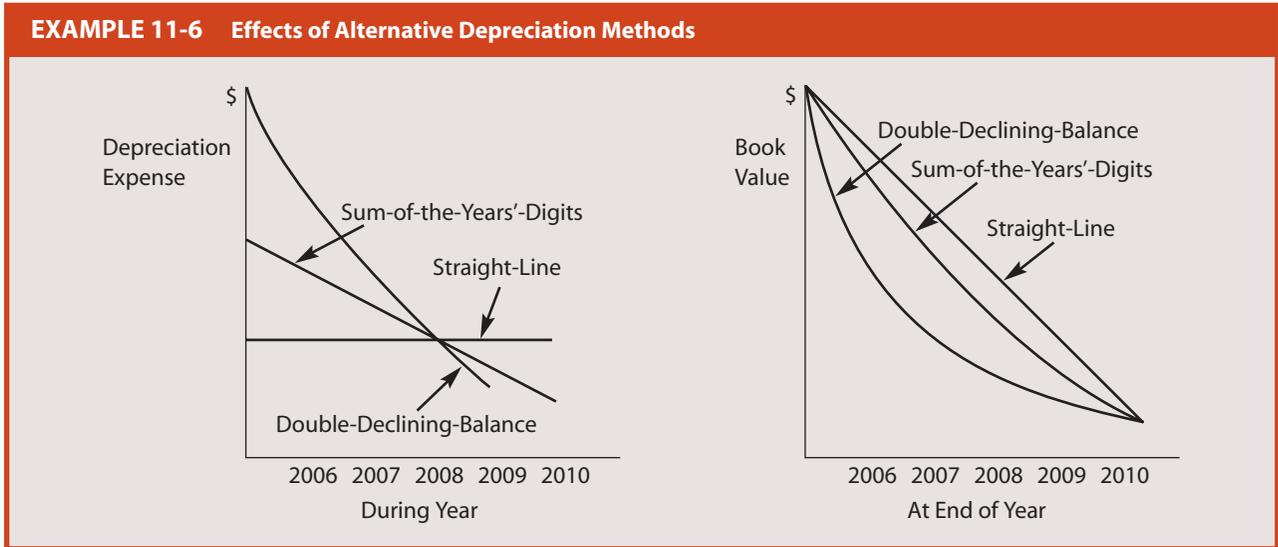

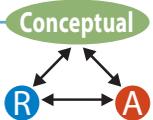

A manufacturing company records depreciation on assets used for its selling, general, and administrative functions as an expense in the period, and includes the total Depreciation Expense each period on its income statement. Similarly, a merchandising company records depreciation on all its assets as an expense each period. Note, however, that many companies choose to disclose their expenses under functional classifications, such as selling, general, and administrative expenses. Therefore, they would not separately report depreciation expense on their income statements. However, the total depreciation expense for the period is a required disclosure.

The credit entry to record depreciation is to a contra-asset account usually called Accumulated Depreciation, or Allowance for Depreciation. A company maintains a separate contra-asset account for each class of assets and should deduct this amount on its balance sheet directly from the cost of that asset class. Alternatively, the company may report the book value on the balance sheet and disclose the cost and accumulated depreciation in the notes to its financial statements. However, many companies combine all the accumulated depreciation amounts and report only the total since this limited disclosure is allowed by GAAP.

### CONCEPTUAL EVALUATION OF DEPRECIATION METHODS

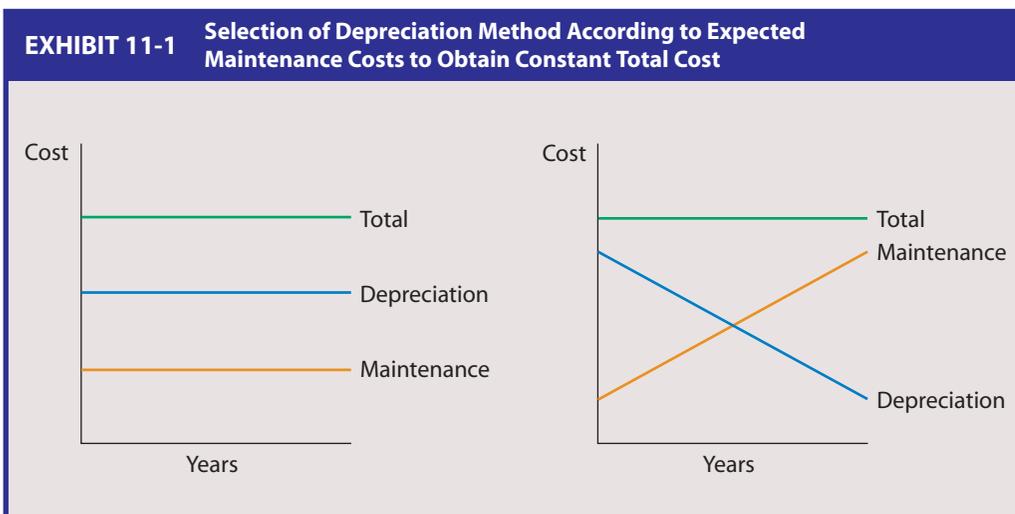

A company may use any of the previously discussed depreciation methods, provided the method relates the allocation of the depreciable cost of the asset to the expected pattern of benefits to be derived from the asset. The choice of a particular method can have a significant impact on a company's income and assets, as you can see by comparing the various depreciation amounts and the book value of the asset computed for the Troup Company. We show these differences in Example 11-6. Use of an inappropriate method has an adverse impact on the measurement of a company's income each year. However, the company's total income over the life of the asset is unaffected because it expenses the same total depreciable cost. For example, if an asset produces equal (or increasing) benefits each year but a company uses an accelerated depreciation method, its income will increase each year of the asset's life (if other factors remain the same each period). This will occur even though there has been no change in the activity each period. The rising income may be misleading to users of the financial statements.

4 Explain the conceptual issues regarding depreciation methods.

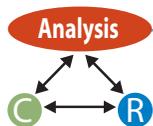

Three additional factors that should be considered when a company selects a depreciation method are repair and maintenance costs, changing prices, and the risk associated with the cash flows from the asset. However, none have been addressed by generally accepted accounting principles. A company should consider the selection of the depreciation

method together with the expected repair and maintenance costs, so that it evaluates the matching of the *total* costs associated with the asset and the benefits derived from the asset. For example, if a company expects that repair and maintenance costs and the total economic benefits of the asset all will remain similar each period, a similar total cost each period can be achieved through straight-line depreciation and the similar repair and maintenance costs. Alternatively, if a company expects increasing repair and maintenance costs, accelerated (declining-charge) depreciation and the increasing repair and maintenance costs each period may produce similar total costs each period. However, repair and maintenance costs would have to increase significantly to offset the decreasing depreciation amounts. We show these two situations in Exhibit 11-1. Alternatively, a company may expect that benefits will decline each year for the life of the asset, and that repair and maintenance costs are constant each period or are not rising as fast as the depreciation is declining. Then, a declining total cost will be achieved by using accelerated (declining-charge) depreciation along with the expected repair and maintenance costs.

Inflation is likely to have a significant effect on the measurement of the benefits, or revenue, over the life of the asset. In selecting a depreciation method, a company should consider whether its benefits are to be measured in terms of current dollars or dollars realized in future periods. Since GAAP is silent on this issue, either alternative is acceptable.

In these periods of rapid technological change, an asset may become obsolete before the end of its originally estimated useful life. Therefore, there is a greater risk associated with the estimated revenues near the end of the life of the asset than for those at the beginning. Use of accelerated depreciation may be appropriate in such situations because the lower depreciation recorded late in the life of the asset reduces the amount of revenues that have to be earned for the asset to be profitable.

A ratio commonly used in financial analysis is the rate of return on total assets, which is defined as (net) income divided by the assets. An unfortunate impact of recording depreciation is that the rate of return on assets increases over time. Refer back to the Troup Company example using straight-line depreciation in Example 11-2. Suppose, in addition, that net income after depreciation and income taxes is \$12,000 per year and that the company owns only this one asset. The rate of return earned by the company increases each year as we show in Example 11-7. (The calculation of the rate of return could also be based on the average of the beginning and ending book values of the asset.) The increase in the rate of return over the life of the asset would be even more dramatic if an accelerated depreciation method were used. As a result of this relationship, a user should always be

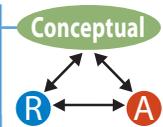

careful when calculating the rate of return during financial statement analysis. Comparison between two companies can be distorted if one company has a newer asset base and hence a lower rate of return. Alternatively, if one company is analyzed over time, its rate of return will increase as its asset base gets older, other things being equal.

#### EXAMPLE 11-7 Effect of Depreciation on Rate of Return

Year	Net Income	Book Value of Asset at Beginning of Year	Rate of Return
2006	\$12,000	\$120,000	10%
2007	12,000	100,000	12
2008	12,000	80,000	15
2009	12,000	60,000	20
2010	12,000	40,000	30

Depreciation is intended only to allocate the cost in a systematic and rational manner. It is *not* an attempt to measure the *fair value* of the asset. The only times that a company should expect to report the fair (market) value of a property, plant, and equipment asset is on the date of acquisition and the date of disposal. Therefore, accounting principles match the cost of the asset against the benefits it produces, rather than an alternative approach of valuing the asset at its fair value. Many users consider the fair value only to be relevant for assets that are held for sale rather than held for use.

Depreciation is *not* recorded in an attempt to provide funds for the replacement of the asset. Over the life of the asset, the total depreciation expense is equal to the depreciable cost. Since depreciation is a tax-deductible expense, there is an income tax savings over the life of the asset. However, the savings is equal only to the tax rate multiplied by the total amount of tax depreciation. Therefore, there will not be sufficient cash saved over the life of the asset to replace it. Also, the purchase of an asset requires that cash be available at the time of the purchase, or that the company be able to obtain the necessary funds by borrowing or selling stock. However, the cash saved in income taxes may have been used to help finance the company's operations and may not be available for asset acquisitions. Also, in times of rising prices, the cost of replacing the asset will be higher than the original cost, so that additional funds will be required for the replacement.

## DISCLOSURE OF DEPRECIATION

APB Opinion No. 12 requires the following disclosure requirements for depreciation:

- Depreciation expense for the period
- Balances of major classes of depreciable assets, by nature or function, at the balance sheet date
- Accumulated depreciation, either by major classes of depreciable assets or in total, at the balance sheet date
- A general description of the method or methods used in computing depreciation with respect to major classes of depreciable assets<sup>5</sup>

5 Understand the disclosure of depreciation.

5. "Omnibus Opinion—1967," APB Opinion No. 12 (New York: AICPA, 1971), par. 5.

We show the disclosure of these items for **Anheuser-Busch** in Real Report 11-1. The depreciation (and amortization) expense of \$932.7 million in 2004 was disclosed (after adjusting for the amortization expense) in the company's statement of cash flows under the indirect method.

### Real Report 11-1 Consolidated Balance Sheet

#### ANHEUSER-BUSCH COMPANIES, INC. AND SUBSIDIARIES

NOTES TO CONSOLIDATED FINANCIAL STATEMENTS (in part)

*Note 1. Summary of Significant Accounting Principles and Policies (in part):*

#### FIXED ASSETS

Fixed assets are carried at original cost less accumulated depreciation, and include expenditures for new facilities as well as those that increase the useful lives of existing facilities. The cost of routine maintenance, repairs and minor renewals is expensed as incurred. Depreciation expense is recognized using the straight-line method based on the following weighted average useful lives: buildings, 25 years; production machinery and equipment, 15 years; furniture and fixtures, 10 years; computer equipment, 3 years. When fixed assets are retired or sold, the book value is eliminated, and any gain or loss on disposition is recognized in cost of sales.

The components of plant and equipment as of December 31 are summarized below (in millions):

	December 31	
	2004	2003
Land	\$ 278.9	\$ 278.8
Buildings	4,750.6	4,546.1
Machinery and equipment	11,907.4	11,208.0
Construction in progress	475.6	488.3
Plant and equipment, at cost	17,412.5	16,521.2
Accumulated depreciation	(8,565.1)	(8,022.3)
Net plant and equipment	<u>\$ 8,847.4</u>	<u>\$ 8,498.9</u>

#### Questions:

1. Why do you think the company selected its depreciation method?
2. What is the estimated average age of Anheuser-Busch's property, plant, and equipment at the end of 2004?

We show the relative use of alternative depreciation methods by 600 surveyed companies in Exhibit 11-2. Note that the straight-line method is used by most companies. There are more than 600 responses because many companies use more than one method of depreciation. Even with the current disclosure requirements, the reader of a company's

#### EXHIBIT 11-2 Use of Alternative Depreciation Methods

financial statements is not able to evaluate whether the chosen depreciation method(s) is appropriate for the particular assets, but must accept that management and the company's auditors consider the method(s) to be systematic and rational. Nor is the reader able to estimate accurately the effect on income and assets of the use of an alternative depreciation method, which might be useful when comparing the financial activities of two companies using different depreciation methods.

## LINK TO INTERNATIONAL DIFFERENCES

International accounting standards for depreciation are essentially the same as those in the United States. However, they only require that depreciation be “systematic,” rather than “systematic and rational.” International standards also require that the estimated useful lives and residual values of the assets, and the depreciation method, be reviewed at least once a year. They also require that companies disclose the accumulated depreciation for each class of asset, not just the total amount as allowed by U.S. standards. Also note that international standards allow a company to write up the value of its property, plant, and equipment assets to fair value, as we discussed in Chapter 10. Such a write-up would affect the amount of depreciation that the company records each period.<sup>6</sup>

## ADDITIONAL DEPRECIATION METHODS

Some additional depreciation methods are **group-rate** and **composite-rate** methods, which are used frequently with the straight-line or accelerated methods, and **inventory systems**.<sup>7</sup>

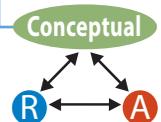

Group and composite depreciation are conceptually similar methods of applying depreciation to more than one asset. Group depreciation is applied to *homogeneous* assets that are expected to have similar service lives and residual values. Composite depreciation is applied to *heterogeneous* assets having some similar characteristics, but are expected to have varying service lives and residual values. Thus, group depreciation would be used for homogeneous assets such as laptops, whereas composite depreciation would be applied to heterogeneous assets such as office machines.

6 Understand additional depreciation methods, including group and composite methods.

### Group Depreciation

A company uses group depreciation when it owns a group of homogeneous (similar) assets. Under this method, the company uses the following procedures:

- It capitalizes the assets in one asset account.
- It treats the group as one “asset” for purposes of depreciation.
- It bases the group depreciation rate on the average life of the assets in the group.
- It accumulates the depreciation in a single contra-asset account.
- It calculates the depreciation each period by multiplying this rate by the balance in the asset account.
- When an item in the group is retired, the company does not recognize a gain or loss on that item because the entire “asset” is not retired.

6. For additional discussion see Carrie Bloomer (editor), *The IASC–U.S. Comparison Project: A Report on the Similarities and Differences between IASC Standards and U.S. GAAP*, 2nd ed. (Norwalk, Conn: FASB, 1999).
7. Two other methods, the **compound-interest** and **sinking-fund** methods, are based on present value concepts. They result in an *increasing* depreciation amount and a constant rate of return on the asset each period. They are very rarely used because increasing depreciation each period generally is not considered to satisfy the matching principle.

- It records the retirement of an item in the group by a credit to the asset account for the original cost, and a debit to the accumulated depreciation account for the difference between the cost and the proceeds received.
- It recognizes a total net gain or loss on the group as a whole when the final unit in the group is retired.

### Example: Group Depreciation

Suppose that a company purchases 10 cars for \$20,000 each, and the average expected service life is three years with a residual value of \$5,000 each. Of those cars, three are sold after two years for \$8,000 each, five after three years for \$6,000 each, and two after four years for \$4,800 each. The company computes the depreciation rate as follows:

$$\begin{aligned} \text{Depreciation} &= \frac{\text{Cost} - \text{Residual Value}}{\text{Life}} \\ &= \frac{\$200,000 - \$50,000}{3} \\ &= \$50,000 \text{ (or 25\% of the cost of the assets)} \end{aligned}$$

We show the journal entries used to record these events in Example 11-8. Depreciation expense is based on the original estimates, and the rate is not changed by the early retirement of three cars after the second year. No gain or loss is recognized on the retirement at the end of the second and third years. The journal entries in the fourth year (the year of the final retirement) need further explanation. First, the usual procedure in group depreciation is to multiply the asset cost by the group depreciation rate to determine the annual depreciation expense. However, it is a general rule that assets are not depreciated below their residual value. Since the book value of the group asset is \$11,000 (\$40,000 Cars – \$29,000 Accumulated Depreciation) at the beginning of the year and the residual value of the two remaining cars is \$10,000 (2 × \$5,000), the depreciation expense must be \$1,000 in this year. Second, the \$400 loss on the *entire* group is determined by comparing the \$9,600 (2 × \$4,800) proceeds to the \$10,000 book value at the end of the fourth year. ♦

Suppose the company purchases a new asset (i.e., more cars) before the group is retired. In this case, it computes a new depreciation rate by dividing the new depreciation base (book value at the beginning of the period plus the additional cost less the estimated residual value of the group) by the new weighted average of the remaining lives of the assets in the group.

### Composite Depreciation

A company may apply composite depreciation to heterogeneous (dissimilar) assets that have somewhat similar characteristics or purposes. It uses similar procedures to group depreciation, as follows:

- The company combines the assets in one asset account and depreciates them accordingly.
- The company uses one accumulated depreciation account.
- The company does not recognize a gain or loss on each item retired.
- The company recognizes a net gain or loss when it retires the final asset.

### Example: Composite Depreciation

Suppose that a company purchases three assets with the following characteristics:

Asset	Cost	Residual Value	Life	Annual Depreciation
A	\$25,000	\$5,000	10 years	\$2,000
B	13,000	1,000	6	2,000
C	12,000	—	4	3,000
	<u>\$50,000</u>	<u>\$6,000</u>		<u>\$7,000</u>

**EXAMPLE 11-8 Journal Entries for Group Depreciation**

1. To record the purchase:			
Cars	200,000		
Cash		200,000	
2. To record the first year's depreciation expense:			
Depreciation Expense	50,000		
Accumulated Depreciation		50,000	
3. To record the second year's depreciation expense:			
Depreciation Expense	50,000		
Accumulated Depreciation		50,000	
4. To record the disposal of three cars at the end of the second year for \$8,000 each:			
Cash	24,000		
Accumulated Depreciation	36,000		
Cars		60,000	
5. To record the third year's depreciation expense:			
Depreciation Expense [25% × (\$200,000 – \$60,000)]	35,000		
Accumulated Depreciation		35,000	
6. To record the disposal of five cars at the end of the third year for \$6,000 each:			
Cash	30,000		
Accumulated Depreciation	70,000		
Cars		100,000	
7. To record the depreciation expense for the fourth year, the disposal of two cars at the end of the fourth year for \$4,800 each, and the <i>net</i> gain or loss of the <i>entire</i> group:			
Depreciation Expense	1,000 <sup>a</sup>		
Accumulated Depreciation		1,000	
Cash	9,600		
Accumulated Depreciation	30,000		
Loss on Disposal	400 <sup>b</sup>		
Cars		40,000	

<sup>a</sup> The depreciation expense is the amount needed to reduce the \$11,000 book value (\$40,000 remaining cost minus \$29,000 remaining accumulated depreciation) of the group to the estimated residual value (2 × \$5,000).

<sup>b</sup> The loss is equal to the proceeds of \$9,600 (2 × \$4,800) minus the remaining book value of \$10,000 (\$40,000 – \$30,000).

Assuming that the company uses straight-line depreciation, it computes the composite depreciation rate as follows:

$$\text{Depreciation Rate} = \frac{\$7,000}{\$50,000} = 14\%$$

The company computes the depreciation by multiplying 14% by the cost of the assets remaining in service until the book value equals the estimated residual value of \$6,000. If the company purchases another asset, it may include the asset in the group by adding the cost to the asset account. Then it calculates a new composite depreciation rate.

The advantage of both the group and the composite methods is that they simplify a company's record keeping, especially when it acquires a large number of low-cost items. The methods also recognize that depreciation estimates are based on averages and that gains or losses on disposals of single assets are often immaterial. The major disadvantage of the two methods is that faulty estimates might be concealed for long periods. Also, gains and losses may be deferred beyond the period in which they actually occurred. This

is particularly true when heterogeneous assets are combined for the composite depreciation method, and the average life is the result of combining varying individual lives. ♦

## Inventory Systems

The inventory (or appraisal) system typically is used in situations where there are large numbers of similar low-cost items, such as tools for a manufacturing company or dishes for a restaurant. The method is similar to a periodic inventory system, in that a cost is assigned to an expense by a physical count at the end of the year. That is, the cost that a company assigns to depreciation is determined by multiplying the physical number of units at the end of the year by the replacement cost. Then, it subtracts that amount from the “inventory” cost at the beginning of the year to determine the depreciation expense. The ending inventory usually is computed as the value (not the cost) of the assets, so that the depreciation becomes a measure of the change in the value of the assets. The method is criticized because it does not result in a systematic and rational allocation of cost, but rather is a measure of the value of the assets. Also, the value assigned to the inventory tends to be less reliable than cost.

### SECURE YOUR KNOWLEDGE 11-1

- Depreciation, depletion, and amortization are allocation processes that attempt to match the cost of an asset against the revenue that the asset helps to generate.
- The four factors that must be considered in computing depreciation are:
  - Asset cost—acquisition cost, as discussed in Chapter 10.
  - Service life—the amount of use that the company expects from the asset prior to disposal, measured in units of time or in units of activity.
  - Residual value—the amount that a company expects to receive for an asset at the end of its useful life.
  - Method of cost allocation—must be systematic and rational.
- Time-based depreciation methods result in a depreciation amount that is related to the passage of time.
  - The straight-line method allocates an equal amount of the asset’s depreciable cost to each year of the service life.
  - Accelerated methods (sum-of-the-years’-digits and declining balance) result in periodic depreciation amounts that decline over the asset’s service life.
- Activity-based depreciation methods result in a depreciation rate that is based on estimated usage (e.g., number of hours worked or output produced), and this rate is then multiplied by actual usage to compute the depreciation amount.
- Depreciation on assets used for selling, general, and administrative functions is recorded as a current period expense on the income statement; however, depreciation on manufacturing assets is recorded as part of the cost of inventory.
- While a company selects from acceptable depreciation methods that are systematic and rational, this choice can have a significant impact on a company’s income and assets.
- A company may choose to combine multiple assets into one asset account and use group depreciation (for homogeneous assets) or composite depreciation (for heterogeneous assets) to simplify record keeping.

## DEPRECIATION FOR PARTIAL PERIODS

Our discussion so far has assumed that assets are purchased on the first day of the fiscal year and disposed of on the last day. Of course, transactions occur throughout the fiscal year. Also, depreciation could be computed to the nearest day, but such precision is unnecessary, since the calculation of depreciation uses estimates. There are three common alternative policies that companies use to compute depreciation for partial periods.

**7** Compute depreciation for partial periods.

## Compute Depreciation to the Nearest Whole Month

Under this method, assets purchased on or before the 15th of the month are considered owned for the whole month; assets purchased after the 15th are considered *not* to be owned during the month. Similarly, assets sold on or before the 15th are considered not to be owned for the month; assets sold after the 15th are considered owned for the whole month. Depreciation is based on the fraction of the year the asset is used. When a company uses straight-line depreciation and calculates depreciation for months instead of years, it usually states the denominator of the depreciation calculation as the total months in the estimated service life. This results in a monthly depreciation amount. We show the more complex issues when a company uses accelerated depreciation methods.

### Example: Depreciation for Partial Periods

Suppose Vann Company purchases a \$6,000 asset with a three-year life and no residual value on August 18. Thus four months remain in the year. It uses the *sum-of-the-years'-digits depreciation* method over four fiscal years and computes the amounts as follows:

Fiscal Year	Annual Depreciation by Sum-of-the-Years'-Digits Method	Months	Computation	Annual Depreciation
1	\$3,000	4	$4/12 \times \$3,000$	\$1,000
2	2,000	12	$8/12 \times \$3,000 + 4/12 \times \$2,000$	2,667
3	1,000	12	$8/12 \times \$2,000 + 4/12 \times \$1,000$	1,667
4	—	8	$8/12 \times \$1,000$	666*
	<u>\$6,000</u>			<u>\$6,000</u>

\*Adjusted for \$1 rounding error

If Vann Company use *double-declining depreciation* for partial periods, two alternatives are available. In the first alternative, it can use the double-declining-balance method in the same way as we just described for the sum-of-the-years'-digits method. That is, the depreciation on an annual basis is allocated to each fiscal year on the basis of the number of months. In the second alternative, after computing the depreciation for the first year as described for the first alternative, it can apply the double-declining-balance method by multiplying the book value by the appropriate percentage (66.7%). Using the same example of a \$6,000 asset with a three-year life and no residual value, Vann Company computes the depreciation under the two alternatives as follows:

Fiscal Year	Annual Depreciation by the Double-Declining-Balance	Months	Computation	Reported Annual Depreciation
<i>Alternative 1</i>				
1	\$4,000	4	$4/12 \times \$4,000$	\$1,333
2	1,333	12	$8/12 \times \$4,000 + 4/12 \times \$1,333$	3,111
3	667	12	$8/12 \times \$1,333 + 4/12 \times \$667$	1,111
4	—	8	$8/12 \times \$667$	445
	<u>\$6,000</u>			<u>\$6,000</u>
<i>Alternative 2</i>				
Depreciation Year 1			$4/12 \times \$4,000$	\$1,333
Depreciation Year 2			$0.667* \times (\$6,000 - \$1,333)$	3,113
Depreciation Year 3			$0.667 \times (\$4,667 - \$3,113)$	1,037
Depreciation Year 4			Remaining balance	517
				<u>\$6,000</u> ♦

\*Two times straight-line rate =  $2 \times 1/3$

### Compute Depreciation to the Nearest Whole Year

For this partial depreciation method, exactly the same procedure is used as for the monthly situation, except that six months is used as the cutoff instead of the 15th of the month. That is, assets purchased during the first six months of the year are considered to be owned for the entire year, and assets purchased during the second six months are not depreciated for that year. Using the same example, with straight-line depreciation there is no depreciation in the first fiscal year, since the asset was purchased in the second half of the year. However, a full year's depreciation is recorded in the last year. Under the sum-of-the-years'-digits method, depreciation in the four fiscal years is \$0, \$3,000, \$2,000, and \$1,000, respectively.

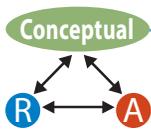

### Compute One-Half Year's Depreciation on All Assets Purchased or Sold During the Year

Under this method, all assets purchased or sold during the fiscal year are considered to have been purchased or sold at the midpoint of the year. Therefore, one-half year's depreciation is recorded in all such situations. Using the same example, the depreciation for each fiscal year is computed as follows:

Fiscal Year	Annual Depreciation by Sum-of-the-Years'-Digits Method	Computation	Reported Annual Depreciation
1	\$3,000	$1/2 \times \$3,000$	\$1,500
2	2,000	$1/2 \times \$3,000 + 1/2 \times \$2,000$	2,500
3	1,000	$1/2 \times \$2,000 + 1/2 \times \$1,000$	1,500
4	—	$1/2 \times \$1,000$	500
	<u>\$6,000</u>		<u>\$6,000</u>

## IMPAIRMENT OF PROPERTY, PLANT, AND EQUIPMENT

8 Explain the impairment of property, plant, and equipment.

Users have been concerned for a long time about the values that a company assigns to its property, plant, and equipment. If the fair value of these noncurrent assets is less than their book value, then the company's past earnings may be overstated (because it did not record sufficient depreciation in prior years). Conservatism would suggest that the company write down these assets and recognize a loss. Also, if a company writes down an asset by too much, then future profits will be overstated (because it would record too little depreciation in future years). **FASB Statement No. 144<sup>8</sup>** requires that a company review its property, plant, and equipment for impairment whenever events or changes in circumstances indicate that the book value of the property, plant, and equipment may not be recoverable. Examples of such events or changes in circumstances include:

- a significant decrease in the fair value of the asset,
- a significant change in the way the asset is used,
- a significant change in the business or regulatory environment,
- costs of constructing the asset that exceed the planned amount,
- a current period operating loss,
- a negative cash flow from operating activities,
- or an expectation that the asset will more-likely-than-not (i.e., more than 50% chance) be sold or otherwise disposed of before the end of its useful life.

8. "Accounting for the Impairment or Disposal of Long-Lived Assets," *FASB Statement of Financial Accounting Standards No. 144* (Norwalk, Conn.: FASB 2001). Certain assets are excluded from the scope of the *Statement*, including specialized assets in the record, music, broadcasting, and software industries. The *Statement* replaced, but made only minor changes to, *FASB Statement of Financial Accounting Standards No. 121* which was issued in 1995.

After the company identifies that an asset may be impaired, two steps are taken: (1) an impairment test, and (2) measurement of the loss.

## Impairment Test

To test for impairment, the company estimates the future net cash flows expected to result from the use of the asset and its eventual sale. If the total expected cash flows (undiscounted) are less than the book value of the asset, the company must recognize an impairment loss. One of the major issues faced by the FASB was asset grouping. That is, does the company test individual assets or large groups of assets? The FASB resolved this issue by requiring that assets be grouped at the lowest level at which identifiable cash flows are largely independent of the cash flows of other groups of assets. (We will use the singular term “asset” to describe the group of assets identified by a company.) If the future cash flows exceed the book value, an impairment loss is *not* recognized, but a review of the company’s depreciation policies may be appropriate.

## Measurement of the Loss

The impairment loss for an asset that the company intends to hold and use is the difference between the asset’s book value and its lower fair value.<sup>9</sup> The fair value is the amount at which the asset could be bought or sold in a current transaction between willing parties. However, quoted market prices will often not be available for the assets covered by *FASB Statement No. 144*. Therefore, fair value may be measured by using the present value method to determine the discounted cash flows (as we discuss in the Time Value of Money Module). The discount rate is the rate of return that the company would require for a similar investment with similar risks. For example, this could be the rate used to evaluate capital budgeting projects.

## Recording and Reporting the Loss

When a company recognizes an impairment loss (debit), it writes down the asset (credit) to reduce its book value to the lower fair value (as we show in the example that follows). The company reports the impairment loss on its income statement as part of income from continuing operations and reports the new (reduced) book value on its ending balance sheet. The reduced book value (i.e., fair value) becomes the new “cost” of the asset and is used to compute the depreciation over the remaining life of the asset. Once an asset has been written down, if the fair value later increases, the asset may *not* be written back up.

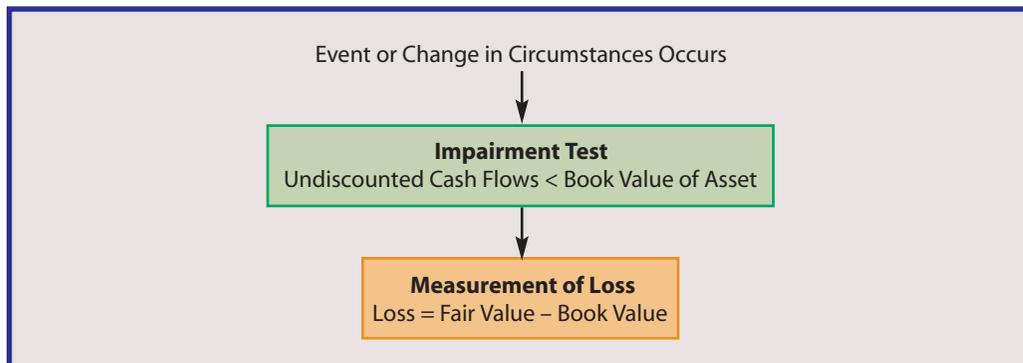

## Disclosures

A company must include in its disclosures in the year of the write-down and the next two years (1) a description of the impaired asset and the circumstances leading to the impairment, (2) the amount of the loss, how the asset’s fair value was determined, (3) the income statement caption which includes the loss, and (4) the operating segment affected (if applicable).

9. The *Statement* also discusses the measurement of an impairment loss for an asset that the company *intends to sell*. The asset is reported at the lower of the (1) book value or (2) fair value less the costs to sell. The impairment loss is calculated in the same way as for an asset held for use, except that the estimated selling price less the costs to sell is used instead of the present value of the cash flows (or other measure of fair value). Thus, the GAAP related to an asset the company expects to sell is similar to that we discussed in Chapter 5 for the disposal of a component of a company and we do not discuss it further.

In summary, an impairment loss involves the following steps:

### Example: Impairment Loss

Suppose that on January 1, 2004, the Hall Company purchased a factory for \$1 million and machinery for \$3 million. The asset(s) is held for use and not for sale. The company is depreciating the factory over 20 years and the machinery over 10 years, both by the straight-line method, to zero residual values. Late in 2007, because of technological changes in the industry and reduced selling prices for its products, the company believes that its asset(s) may be impaired and will have a remaining useful life of five years. The company combines the factory and machinery as a group because the cash flows from each are not separable and are independent of the company's other activities. To test for impairment, the company estimates that the asset will produce cash inflows of \$700,000 and will incur cash outflows of \$300,000 each year for the next five years. The company tests for impairment and measures the loss as follows:

#### Impairment Test

December 31, 2007

Factory cost	\$1,000,000	
Less: Accumulated depreciation (4 years × \$50,000)	<u>(200,000)</u>	
Book value		\$ 800,000
Machinery cost	\$3,000,000	
Less: Accumulated depreciation (4 years × \$300,000)	<u>(1,200,000)</u>	
Book value		<u>1,800,000</u>
Total Book Value		<u><u>\$2,600,000</u></u>

$$\begin{aligned}
 \text{Undiscounted expected net cash flows} &= 5 \text{ years} \times (\$700,000 \text{ cash inflows} - \\
 &\quad \$300,000 \text{ cash outflows}) \\
 &= 5 \times \$400,000 \\
 &= \underline{\underline{\$2,000,000}}
 \end{aligned}$$

Because \$2,000,000 is less than \$2,600,000, the company must recognize an impairment loss.

Since the company is not able to determine the fair value based on the selling price of the factory and machinery, it uses the present value method instead. To apply this method, the company uses a discount rate of 16% (which is the rate of return it uses to evaluate capital budgeting projects). It calculates the impairment loss of \$1,290,282 as follows:

#### Measurement of the Loss

$$\begin{aligned}
 \text{Present value of the expected net cash flows (fair value)} &= \$400,000 \times 3.274294 \\
 &\quad (n = 5, i = 0.16 \text{ from} \\
 &\quad \text{Table 4 in the Time Value} \\
 &\quad \text{of Money Module}) \\
 &= \underline{\underline{\$1,309,718}} \text{ (rounded)}
 \end{aligned}$$

$$\begin{aligned} \text{Impairment loss} &= \$1,309,718 \text{ fair value} - \$2,600,000 \text{ book value} \\ &= \underline{\underline{\$(1,290,282)}} \end{aligned}$$

Although the *Statement* does not specify how to record the write-down, it does indicate that the reduced book value of the asset is to be accounted for as the new cost. Therefore, we will treat the write-down as a “sale” with an acquisition at the new “cost.” We also assume that the new cost is allocated among the individual assets based on their relative fair values at their original acquisition date. Then the Hall Company records the loss as follows:

<b>Loss from Impairment</b>	<b>1,290,282</b>	
<b>Accumulated Depreciation: Factory</b>	<b>200,000</b>	
<b>Accumulated Depreciation: Machinery</b>	<b>1,200,000</b>	
<b>Factory (new cost)</b>	<b>327,429<sup>a</sup></b>	
<b>Machinery (new cost)</b>	<b>982,289<sup>b</sup></b>	
<b>Factory (old cost)</b>		<b>1,000,000</b>
<b>Machinery (old cost)</b>		<b>3,000,000</b>

<sup>a</sup> $\$1,309,718 \times [\$1,000,000 \div (\$3,000,000 + \$1,000,000)]$

<sup>b</sup> $\$1,309,718 \times [\$3,000,000 \div (\$3,000,000 + \$1,000,000)]$

The company will depreciate the factory and machinery over their remaining useful life of five years. It reports the \$1,290,282 loss in income from continuing operations on its 2007 income statement, and the property, plant, and equipment at a total of \$1,309,718 on its 2007 ending balance sheet. ♦

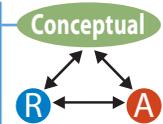

## LINK TO ETHICAL DILEMMA

The fortunes of NetWorth, Inc. are in serious jeopardy. Several years ago, NetWorth was the high-technology darling of Wall Street with the business press constantly heaping praises on NetWorth’s innovative business model and solid management team. However, the recession during the last two years and increasing competition has certainly dampened its future prospects. During the last 18 months, NetWorth has reported only one quarterly profit and the Board of Directors is calling for a quick return to profitability. With current quarterly results looking disappointing, the CFO has called on you to perform an extensive analysis of all property, plant, and equipment items in an effort to identify the nonproductive assets and improve operational efficiency. After informing the CFO that preliminary results indicated an impairment loss of almost \$700 million needed to be recognized, you are instructed to increase the impairment amount by \$300 million and record a \$1 billion impairment loss. When you question the increase in the impairment amount, you are told that upper management thought your estimates of the usefulness of the assets were overly optimistic and that they changed several of your estimates, including the discount rate used in measuring the impairment loss. Since the changes resulted in more conservative financial statements, the CFO was sure you would not object. What is your reaction?

### Conceptual Evaluation of Asset Impairment

*FASB Statement No. 121* first established the impairment rules we just discussed. Although it has been replaced by *FASB Statement No. 144*, the principles it established have only changed slightly. *FASB Statement No. 121* was issued to enhance the usefulness of a company’s financial statements by recognizing the loss when incurred and reporting the fair value of productive assets. This should provide better financial reporting because the asset value reflects the value of the company’s investment. Thus, the information is expected to be more relevant and help users assess the return on investment, operating capability, and risk of the company. The information should also improve comparability across companies.

Although the *Statement* narrows GAAP, it still allows for significant management flexibility. For example, it does not require that assets be tested for impairment on a regular basis, because the FASB concluded that would be too costly. Management will also have some flexibility in deciding which assets to include in, and exclude from, each grouping. Also, estimating future cash flows is very subjective. For example, the company could use current or expected cost and volume information. Furthermore, the discount rate used to value the cash flows is a management choice.

The *Statement* was adopted by a 5-to-2 vote. The dissenters believed that the use of fair value is not appropriate if the asset will continue to be used, because there has not been an exchange transaction. They argued that such use of fair value is a precedent-setting departure from the transaction-based historical cost model (other than for certain investments in marketable securities, as we discuss in Chapter 15). Therefore, the dissenters argued that the asset should be recorded at recoverable cost, either measured on a present value or undiscounted basis. One dissenter also argued that fair value is not relevant and reliable information for property, plant, and equipment that is held and used in the normal course of business. Therefore, the fair value of an impaired asset is also not relevant and reliable. Also the write-down will “guarantee” future profits because of the lower depreciation expense in the future.

Two other concerns were also expressed. First, the cash flows expected by a company from using a specific asset are not necessarily the same as those used to determine the market value of the asset, since the company may use the asset differently from other companies. Therefore, the specific cash flows may not result in a measure of fair value. Second, the test for an impairment may differ for identical assets simply because of the depreciation method (or life) selected by the company. An asset depreciated by an accelerated method will have a lower book value than one depreciated by the straight-line method, and therefore be less likely to meet the impairment test. Even with these concerns, it is hoped that the *Statement* has improved financial reporting. For example, in 2004, **Corning** reported that it would record noncash charges of \$2.8 billion to \$2.9 billion as it reduced the value of the assets in its telecommunication business.

## LINK TO INTERNATIONAL DIFFERENCES

Although international accounting standards for the impairment of assets are similar to those of the United States, there are some differences. International standards use the higher of the asset's net selling price or value in use to determine if an asset is impaired compared to the undiscounted cash flows used in U.S. principles. Typically, this should mean that international companies will recognize impairment losses earlier than U.S. companies. Under international standards, the impairment loss is the difference between the book value and the “trigger” value defined above. Therefore, it is likely that the impairment losses measured under the two sets of principles would be different. Also, international standards allow impairment losses to be reversed, which is not allowed under U.S. standards.

## DEPRECIATION AND INCOME TAXES

- 9 Understand depreciation for income tax purposes.

Companies follow different depreciation rules for computing taxable income than for computing income for financial reporting purposes. The use of different methods is appropriate because the purpose of the depreciation methods required by the income tax laws is to stimulate capital investment through the rapid recovery of capital costs. However, the purpose of accounting income is to present fairly the activities of the company over a particular period. Therefore, companies that are *not* required to follow GAAP may use the tax method in their financial statements.

For assets acquired before 1981, depreciation for income tax purposes is based on use of the straight-line, sum-of-the-years'-digits, and declining-balance methods we discussed

earlier. The asset may not be depreciated below the estimated residual value, and the IRS publishes tables that give a range of the estimated lives to use. For assets purchased in the years 1981 through 1986, the Accelerated Cost Recovery System (ACRS) is used. For assets purchased in 1987 and later, ACRS was modified and is known as MACRS.<sup>10</sup> The following discussion is based on these latest rules.

## MACRS Principles

For an asset purchased in 1987 or later, a company's computations of depreciation for federal income tax purposes and financial reporting purposes differ in three major respects:

1. A mandated tax life, which is usually shorter than the economic life
2. Acceleration of the cost recovery (except for a building)
3. Elimination of the residual value

Each of these differences tends to cause depreciation early in the life of an asset to be higher for income tax purposes than for financial statement reporting. This results in lowering income taxes payable in those years. Over the life of an asset, the sum of the total depreciation and the gain or loss on disposal for both income tax reporting and financial reporting usually will be the same for both methods. Therefore, a company's taxable income over the asset's life usually will be equal to its income before income taxes reported in its financial statements. However, the transfer of income tax payments from early in the life of the asset to later in the life is desirable when present value concepts are considered. Since MACRS depreciation is so different from the depreciation used in a company's financial statements, we briefly discuss it. You should also note that for income tax reporting a company may use the straight-line method over the mandated tax life instead of MACRS. Refer to the Internal Revenue Code, or an income tax book, for a more detailed and technical discussion.

### Shorter Life

The MACRS establishes lives (recovery periods) of 3, 5, 7, 10, 15, 20, 27½ (residential rental buildings), and 39 (commercial buildings) years. Each asset is defined to be in one of the categories, and a company uses that life no matter what economic life it uses for financial reporting purposes.

### Acceleration of Cost Recovery

The depreciation is computed based on the *cost* of the asset. The method used depends on the life of the asset mandated by MACRS, as follows:

Method	MACRS Life (in years)
Double-declining-balance	3, 5, 7, 10
150%-declining-balance	15, 20
Straight-line	27½, 39

All the depreciation calculations for income tax purposes are based on the half-year convention. That is, a company records depreciation for half a year in the year of acquisition and in the last year of the MACRS life. Therefore, the depreciation for tax purposes is spread over one more tax year than the number of calendar years listed previously. Also, when one of the accelerated methods is used, a change is made to the straight-line

10. Following the terrorist attacks of 9/11/01, Congress enacted a temporary change in the MACRS rules. For assets (other than buildings) placed in service between 9/10/01 and 9/11/04, a company receives a tax deduction of 30% of the cost of the asset and then applies MACRS procedures to the remaining 70%. To assist in the economic recovery, Congress enacted a temporary change in the MACRS rules. For new assets (other than buildings) placed in service between 5/6/03 and 12/31/04, a company receives a tax deduction of 50% of the cost of the asset and then applies MACRS procedures to the remaining 50%. We do not include the effects of these temporary rules in the examples and homework throughout the book.

method in the period in which the straight-line depreciation exceeds the amount calculated under the accelerated method. The IRS has published tables to simplify the application of these methods, as we show in Exhibit 11-3.

<b>EXHIBIT 11-3 MACRS Depreciation as a Percentage of the Cost of the Asset</b>						
Year of Life	Tax Life of Asset in Years					
	3	5	7	10	15	20
1.....	33.33%	20.00%	14.29%	10.00%	5.00%	3.750%
2.....	44.45	32.00	24.49	18.00	9.50	7.219
3.....	14.81	19.20	17.49	14.40	8.55	6.677
4.....	7.41	11.52	12.49	11.52	7.70	6.177
5.....		11.52	8.93	9.22	6.93	5.713
6.....		5.76	8.92	7.37	6.23	5.285
7.....			8.93	6.55	5.90	4.888
8.....			4.46	6.55	5.90	4.522
9.....				6.56	5.91	4.462
10.....				6.55	5.90	4.461
11.....				3.28	5.91	4.462
12.....					5.90	4.461
13.....					5.91	4.462
14.....					5.90	4.461
15.....					5.91	4.462
16.....					2.95	4.461
17.....						4.462
18.....						4.461
19.....						4.462
20.....						4.461
21.....						2.231

### Residual Value

The residual value is *not* considered when the MACRS system is used, and so the asset is depreciated to a zero value at the end of its MACRS life. However, the entire proceeds from the disposal of the asset will be taxable since the entire value received will be a gain.

### Example: MACRS

To show the use of the MACRS system and the differences from the calculation of depreciation for financial reporting, consider the following facts for an asset purchased by the Melville Company on January 1, 2006:

Cost	\$200,000
Estimated economic life	8 years
Estimated residual value	\$20,000
Depreciation method for financial statements	Straight-line
MACRS life	5 years
MACRS method	200% declining balance
Disposal	\$15,000 on January 3, 2014

The company computes the MACRS depreciation using the rates from Exhibit 11-3 as follows:

2006:	$\$200,000 \times 20\%$	= \$ 40,000
2007:	$\$200,000 \times 32\%$	= \$ 64,000
2008:	$\$200,000 \times 19.20\%$	= \$ 38,400
2009:	$\$200,000 \times 11.52\%$	= \$ 23,040
2010:	$\$200,000 \times 11.52\%$	= \$ 23,040
2011:	$\$200,000 \times 5.76\%$	= \$ 11,520
		<u>\$200,000</u>

Note that the total depreciation deductions on the company's income tax returns for 2006 through 2011 are \$200,000. Thus, the MACRS depreciation recovers the total cost of the asset on an accelerated basis and ignores any residual value. Also note that the MACRS depreciation is spread over six tax years, even though the tax life is five years. This is because of the half-year MACRS convention. Therefore, the MACRS depreciation is zero in 2012 and 2013. The taxable gain in 2014 when the asset is sold is \$15,000, since the company has depreciated the asset to a zero residual value. Therefore, the total effect on its taxable income for the years 2006 through 2013 is \$185,000 (\$200,000 – \$15,000).

The depreciation for financial reporting purposes is \$22,500  $[(\$200,000 - \$20,000) \div 8]$  for each of the eight years of the asset's economic life from 2006 through 2013. The loss on disposal in 2014 is \$5,000 (\$20,000 book value – \$15,000 proceeds). The total effect on the company's income before income taxes for the years 2006 through 2013 in its income statement is \$185,000 (\$180,000 + \$5,000), which is the same as the total effect on taxable income. The different amounts of depreciation for income tax reporting and financial reporting in each year result in temporary differences, which require interperiod tax allocation, as we discuss in Chapter 19. ♦

**10** Explain changes and corrections of depreciation.

## CHANGES AND CORRECTIONS OF DEPRECIATION

FASB statement No. 154, which we discuss more fully in Chapter 23, describes how a company may make each of the various changes in and corrections of depreciation for the following situations:

1. A change in an estimate of the residual value or the service life of a currently owned asset is accounted for prospectively. The company allocates the undepreciated cost of the asset at the beginning of the year of the change over the new remaining life, considering the new residual value. We include an example (using depletion) in the next section of the chapter.
2. A change in the depreciation method for currently owned assets is also accounted for prospectively. A company may change its depreciation method because of a change in the estimated future benefits expected from the asset. In this case, the company allocates the undepreciated cost of the asset at the beginning of the year over the remaining life (considering the residual value) using the new depreciation method. This change is called a change in accounting estimate that is effected by a change in accounting principle.<sup>11</sup>
3. A correction of an error in depreciation is accounted for as a prior period restatement. The effect on the current period's financial statements involves a correction to the amount in the accumulated depreciation account and an adjustment to retained earnings (net of income taxes) for the amount of the error in previously reported net income. The company's previous financial statements are also corrected (restated). We show this reporting in Chapters 5 and 17, and more fully in Chapter 23, and it is consistent with the requirements of FASB Statement No. 154.

## DEPLETION

**11** Understand and record depletion.

Depletion is the allocation of the depletable cost for the use of a natural resource (wasting asset) to the periods in which benefits are received. It is the same concept as depreciation, but the different term is used for natural resources. Examples of such resources are oil, gas, minerals, timber, and gravel.

A company determines the recorded cost of natural resources by the same principles used for property, plant, and equipment. It is possible that there will be extensive reclamation costs. In this case the company would report a liability and add the same amount to the cost of the asset, as we discussed in Chapter 10.

A company usually records depletion using an activity method. The activity measure is the number of units of the resource that the company expects to extract over the life of the asset. A unit depletion rate is calculated as follows:

$$\text{Unit Depletion Rate} = \frac{\text{Cost} - \text{Residual Value}}{\text{Units}}$$

To determine the actual depletion for a period, the unit depletion rate is multiplied by the actual production for that period.

### Example: Coal Mine Depletion

Suppose that the Reggio Company purchases land for \$3,000,000 from which it expects to extract 1,000,000 tons of coal, the estimated residual value is \$200,000, and it mines

11. If a company has a policy of switching depreciation methods at a specific point in the service life of an asset, this is *not* considered to be a change in accounting estimate that is effected by a change in accounting principle.

80,000 tons of coal in the first year. It calculates the depletion for that year as follows:

$$\begin{aligned}\text{Unit Depletion Rate} &= \frac{\$3,000,000 - \$200,000}{1,000,000 \text{ tons}} \\ &= \underline{\underline{\$2.80 \text{ per ton}}}\end{aligned}$$

$$\begin{aligned}\text{Depletion for Year} &= \$2.80 \times 80,000 \text{ tons} \\ &= \underline{\underline{\$224,000}}\end{aligned}$$

Reggio Company typically makes the journal entry to record the depletion directly to an inventory account. The reason for this is so that the cost is included in Cost of Goods Sold for the units that are sold and in ending inventory for the units on hand at the end of the period. The credit is made either to Accumulated Depletion or directly to the asset account because disclosure of the accumulated depletion amount is not required by GAAP. However, this disclosure is required by the SEC.

The nature of natural resources is such that additional capital expenditures may be made in future periods. In addition, the estimation of the remaining number of units is often uncertain and therefore subject to revision based on new geological information. When additional capital expenditures are incurred or estimates are revised, a new depletion rate is calculated. The new depletion rate is based on the current book value of the asset (including the additional capital expenditures), the new estimate of the residual value, and the new estimate of the remaining units as of the beginning of the year. ♦

**Example: Revised Estimate** Continuing the preceding example, suppose that at the beginning of the second year of operation of the coal mine, a new estimate indicates that the mine has a capacity to produce another 1,600,000 tons (for a lifetime production of 1,680,000 tons). The Reggio Company computes a new unit depletion rate as follows:

$$\begin{aligned}\text{Unit Depletion Rate} &= \frac{\text{Book Value} - \text{Residual Value}}{\text{Remaining Units}} \\ &= \frac{(\$3,000,000 - \$224,000) - \$200,000}{1,600,000} \\ &= \underline{\underline{\$1.61 \text{ per ton}}}\end{aligned}$$

The company uses the new unit depletion rate to compute each year's depletion until it makes new estimates and calculates another depletion rate. ♦

The cost of a natural resource asset may include certain tangible assets, such as buildings and roads on the site of a mine. Since the useful life of the tangible assets is limited by the life of the mine, a company depreciates their cost on the basis of the same activity method as it uses for the mine. Of course, if other improvements have a life shorter than the expected life of the mine, the company depreciates them over their expected economic lives.

Depletion for income tax purposes involves a different concept than for financial reporting. A company can deduct as depletion expense either the **cost depletion** just shown (based on the units sold) or **percentage depletion**. Under percentage (or **statutory**) depletion, the company deducts a stated percentage of gross income as depletion expense. This percentage varies, depending on the type of natural resource, from a minimum of 5% to a maximum of 22%. Also, the total depletion over the life of the asset for income tax purposes may exceed the cost of the asset less the expected residual value. Therefore, most companies use percentage depletion for income tax purposes and cost depletion for financial reporting. The percentage depletion in excess of cost depletion results in a permanent tax difference, as we discuss in Chapter 19.

## SECURE YOUR KNOWLEDGE 11-2

- When assets are not purchased or disposed of on the first or last day of the fiscal year, depreciation may be allocated to the partial periods by:
  - Computing depreciation to the nearest whole month,
  - Computing depreciation to the nearest whole year, or
  - Computing one-half year's depreciation on all assets purchased or sold during the year.
- When the book value of property, plant, and equipment may not be recoverable, a company should:
  - Determine if an impairment exists by comparing the undiscounted cash flows to the book value of the asset, and
  - If an impairment has occurred, measure and record the impairment loss as the difference between the book value of the asset and the fair value of the asset.
- For income tax reporting, a company uses the Modified Accelerated Cost Recovery System (MACRS), an accelerated depreciation method in which assets are placed in defined recovery periods (useful lives) and depreciation is determined by applying predetermined depreciation rates to the cost of the asset. Alternatively, it may use the straight-line depreciation method.
- A change in depreciation method (e.g., straight-line to accelerated method) or any change in the estimates used to compute depreciation (e.g., residual value, service life) are accounted for prospectively.
- A correction of an error in depreciation is accounted for as a prior period restatement.
- Depletion of the cost of a natural resource is recorded using the activity method with the journal entry typically made directly to an inventory account.

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

1. **Identify the factors involved in depreciation.** To record depreciation, a company considers the asset cost, its service life, its residual value, and the method of cost allocation.
2. **Explain the alternative methods of cost allocation, including time-based and activity-based methods.** Accounting principles require that the method of cost allocation be systematic and rational. The available methods include time-based methods, including straight-line, sum of the years' digits, and declining balance, and activity (or use) methods.
3. **Record depreciation.** A company includes depreciation on manufacturing assets as a cost of the inventory produced and records the depreciation as an increase to the Work in Process Inventory account. Depreciation on the remaining assets is expensed in the period.
4. **Explain the conceptual issues regarding depreciation methods.** The choice of a depreciation method has an impact on a company's income measurement and asset valuation. The method should be chosen so that it matches the cost of the asset against the benefits the asset produces. Additional factors that should be considered are repair and maintenance costs, changing prices, and the risk associated with the cash flows from the asset. Also, the rate of return on the asset increases as it ages.
5. **Understand the disclosure of depreciation.** A company is required to disclose depreciation expense for the period, balances of major classes depreciable assets by nature or function, accumulated depreciation either by major classes or in total, and a general description of the method or methods used in computing depreciation.
6. **Understand additional depreciation methods, including group and composite depreciation.** Group depreciation is used for homogeneous assets, whereas composite depreciation is used for heterogeneous assets. In both cases the individual assets are capitalized in one asset account and this asset is treated as a single asset for depreciation. A gain or loss on disposal is only recognized when the final individual asset is disposed of.

7. **Compute depreciation for partial periods.** Depreciation may be computed to the nearest whole month or to the nearest whole year. Alternatively, one-half year's depreciation may be computed on all assets purchased or sold during the year.
8. **Explain the impairment of property, plant, and equipment.** A company must review its property, plant, and equipment for impairment whenever events or changes in circumstances indicate the book value of the asset may not be recoverable. If the total expected cash flows (undiscounted) are less than the book value of the asset, an impairment loss is recognized. The impairment loss is the difference between the asset's book value and its lower fair value.
9. **Understand depreciation for income tax purposes.** Depreciation for income tax purposes uses the Modified Accelerated Cost Recovery System (MACRS). MACRS usually involves a shorter life, an accelerated method (except for buildings), and does not recognize a residual value.
10. **Explain changes and corrections of depreciation.** A change in an estimate of the residual value or the service life of a currently owned asset is accounted for prospectively. A change in the depreciation method for currently owned assets is accounted for prospectively. Adoption of a new depreciation method for newly acquired assets must be disclosed in the notes to the financial statements. A correction of an error in depreciation is treated as a prior period restatement.
11. **Understand and record depletion.** Depletion is the allocation of the depletable cost for the consumption of a natural resource asset to the periods in which the benefits are received. A company normally records depletion using an activity method.

## ANSWERS TO REAL REPORT QUESTIONS

### Real Report 11-1 Answers

1. Straight-line depreciation is the most widely used and easily understood of all the depreciation methods. The straight-line method tends to produce higher income and stockholders' equity amounts compared with the accelerated methods. Furthermore, many of Anheuser-Busch's fixed assets (land, buildings, machinery, and equipment) may provide benefits evenly over time, which is consistent with the results of the straight-line method. Additionally, any benefit derived from using an alternative depreciation method may not exceed the increased costs associated with that method. Finally, while Anheuser-Busch may use the straight-line method for financial reporting purposes, it is still free to use the IRS's modified accelerated cost recovery system (an accelerated method that would produce a higher amount of depreciation expense and lower taxable income relative to the straight-line method) for tax purposes.
2. The average age of Anheuser-Busch's property, plant, and equipment can be estimated by dividing accumulated depreciation by the annual depreciation expense. For Anheuser-Busch, the average age of its property, plant, and equipment at the end of 2004 is 9.2 years ( $\$8,565.1 \div \$932.7$ ).

## QUESTIONS

- Q11-1** Distinguish among the use of the terms *depreciation*, *depletion*, and *amortization*.
- Q11-2** Briefly explain the meaning of the four factors that are involved in the computation of a company's periodic charge for depreciation.
- Q11-3** What is the *depreciation base*?
- Q11-4** What is the objective of accounting for depreciation?
- Q11-5** Explain how recording depreciation affects a company's (a) income statement, (b) balance sheet, and (c) statement of cash flows.
- Q11-6** Does recording depreciation generate funds for the replacement of the asset? Explain.
- Q11-7** Under what circumstances is depreciation a fixed cost or a variable cost?
- Q11-8** What are the primary causes of depreciation? For each cause, indicate which depreciation method may be most appropriate. Would it be desirable to require all companies to use the same method?
- Q11-9** Under what circumstances are accelerated methods of depreciation most appropriate?
- Q11-10** Compare the group and composite methods of depreciation.
- Q11-11** Under what circumstances is an asset's depreciation amount not included in total in a company's current income statement?

**Q11-12** In a year in which the cost of replacing an asset rises, should a company record depreciation for that asset? Why?

**Q11-13** A company should use an accelerated depreciation method because of the large decline in the value of an asset early in its life. Evaluate this statement.

**Q11-14** The manager of a utility stated that since its transmission lines are kept in good condition by regular repairs and maintenance and their efficiency remains constant, the lines do not depreciate. Do you agree with this statement?

**Q11-15** What disclosures of depreciation are required in a company's financial statements and the accompanying notes?

**Q11-16** Why might depreciation on a company's financial statements be different from depreciation the company computed for income tax purposes?

**Q11-17** How does a company's depletion for income tax purposes vary from its depletion for financial reporting purposes?

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

**M11-1** A method that excludes residual value from the base for the depreciation calculation is

- a. Straight-line                      c. Double-declining-balance  
b. Sum-of-the-years'-digits      d. Productive-output

Items 2 through 4 are based on the following information:

Vorst Corporation's schedule of depreciable assets at December 31, 2007 was as follows:

Asset	Cost	Accumulated Depreciation	Acquisition Date	Residual Value
A	\$ 100,000	\$ 64,000	2006	\$20,000
B	55,000	36,000	2005	10,000
C	70,000	33,600	2005	14,000
	<u>\$225,000</u>	<u>\$133,600</u>		<u>\$44,000</u>

Vorst takes a full year's depreciation expense in the year of an asset's acquisition, and no depreciation expense in the year of an asset's disposition. The estimated useful life of each depreciable asset is five years.

**M11-2** Vorst depreciates asset A on the double-declining-balance method. How much depreciation expense should Vorst record in 2008 for asset A?

- a. \$32,000                              c. \$14,400  
b. \$25,600                              d. \$6,400

**M11-3** Using the same depreciation method as used in 2005, 2006, and 2007, how much depreciation expense should Vorst record in 2008 for asset B?

- a. \$6,000                                c. \$11,000  
b. \$9,000                                d. \$12,000

**M11-4** Vorst depreciates asset C by the straight-line method. On June 30, 2008, Vorst sold asset C for \$28,000 cash. How much gain (loss) should Vorst record in 2008 on the disposal of asset C?

- a. \$2,800                                c. (\$5,600)  
b. (\$2,800)                              d. (\$8,400)

**M11-5** The composite depreciation method

- a. Is applied to a group of homogeneous assets  
b. Is an accelerated method of depreciation  
c. Does not recognize gain or loss on the retirement of single assets in the group  
d. Excludes residual value from the base of the depreciation calculation

**M11-6** On July 1, 2006, Mundo Corporation purchased factory equipment for \$50,000. Residual value was estimated at \$2,000. The equipment will be depreciated over 10 years using the double-declining-balance method. Counting the year of acquisition as one-half year, Mundo should record 2007 depreciation expense of

- a. \$7,680                                c. \$9,600  
b. \$9,000                                d. \$10,000

**M11-7** A fixed asset with a five-year estimated useful life is sold during the second year. How would the use of the straight-line method of depreciation instead of the double-declining-balance method of depreciation affect the amount of gain or loss on the sale of the fixed asset?

	Gain	Loss
a.	No effect	No effect
b.	No effect	Increase
c.	Decrease	Increase
d.	Increase	Decrease

**M11-8** Crowder Company acquired a tract of land containing an extractable natural resource. Crowder is required by the purchase contract to restore the land to a condition suitable for recreational use after it has extracted the natural resource. Geological surveys estimate that the recoverable reserves will be 5,000,000 tons and that the land will have a value of \$1,000,000 after restoration. Relevant cost information follows:

Land	\$9,000,000
Estimated restoration costs	1,500,000

The company expects that the machine could be used for 10 years, after which the salvage value would be zero. However, Reveille, Inc. intends to use the machine only eight years, after which it expects to be able to sell it for \$9,800. The invoice for Machine #204 was paid April 10, 2007. The number of units produced in 2007 and 2008 were 23,200 and 29,000, respectively. Reveille computes depreciation to the nearest whole month.

#### Required

Compute the depreciation for the years indicated, using the following methods (round your answer to the nearest dollar):

- 2007: Units of production
- 2008: Sum-of-the-years'-digits method (*Contributed by Norma C. Powell*)

**E11-4 Depreciation Methods** The Nickle Company purchased an asset for \$17,000 on January 2, 2007. The asset has an expected residual value of \$1,000. The depreciation expense for 2007 and 2008 is shown next for three alternative depreciation methods:

Year	Method A	Method B	Method C
2007	\$4,000	\$6,400	\$6,375
2008	4,000	4,800	3,984

#### Required

- Which depreciation method is the company using in each example?
- Compute the depreciation expense for 2009 and 2010 under each method.

**E11-5 Depreciation and Rate of Return** The Burrell Company purchased a machine for \$20,000 on January 2, 2007. The machine has an estimated service life of five years and a zero estimated residual value. The asset earns income before depreciation and income taxes of \$10,000 each year. The tax rate is 30%.

#### Required

Compute the rate of return earned (on the average net asset value) by the company each year of the asset's life under the straight-line and the double-declining-balance depreciation methods. Assume that the machine is the company's only asset.

**E11-6 Determination of Acquisition Cost** On January 1, 2006, the Emming Corporation purchased some machinery. The machinery has an estimated life of 10 years and an estimated residual value of \$5,000. The depreciation on this machinery was \$20,000 in 2008.

#### Required

Compute the acquisition cost of the equipment under the following depreciation methods:

- Straight-line
- Sum-of-the-years'-digits
- Double-declining-balance

**E11-7 Group Depreciation** The Loban Company purchased four cars for \$9,000 each, and expects that they would be sold in three years for \$1,500 each. The company uses group depreciation on a straight-line basis.

#### Required

- Prepare journal entries to record the acquisition and the first year's depreciation.
- If one of the cars is sold at the beginning of the second year for \$7,000, what journal entry is required?

**E11-8 Composite Depreciation** The Wilcox Company acquires four machines that have the following characteristics:

Machine	Cost	Estimated Residual Value	Estimated Service Life
A	\$26,000	\$2,000	6 years
B	19,000	1,000	9
C	30,000	5,000	5
D	28,000	—	7

#### Required

- Prepare journal entries to record the acquisition and the first year's depreciation, assuming that the composite method is used on a straight-line basis.
- If the company sells machine B after four years for \$10,000, prepare the journal entry.
- What arguments may be used to support the composite depreciation method?

**E11-9 AICPA Adapted Depreciation** On January 2, 2007, Lapar Corporation purchased a machine for \$50,000. Lapar paid shipping expenses of \$500, as well as installation costs of \$1,200. The company estimated that the machine

would have a useful life of 10 years and a salvage value of \$3,000. In January 2008, the company made additions costing \$3,600 to the machine in order to comply with pollution-control ordinances. These additions neither prolonged the life of the machine nor increased the salvage value.

#### Required

If Lapar records depreciation under the straight-line method, how much is the depreciation expense for 2008?

**E11-10 Partial Periods** On May 10, 2007, the Horan Company purchased equipment for \$25,000. The equipment has an estimated service life of five years and zero residual value. Assume that straight-line depreciation is used.

#### Required

Compute the depreciation for 2007 for each of the following four alternatives:

1. The company computes depreciation to the nearest day. (Use 12 months of 30 days each.)
2. The company computes depreciation to the nearest month. Assets purchased in the first half of the month are considered owned for the whole month.
3. The company computes depreciation to the nearest whole year. Assets purchased in the first half of the year are considered owned for the whole year.
4. The company records one-half year's depreciation on all assets purchased during the year.

**E11-11 Asset Impairment** On January 1, 2003, the Vallahara Company purchased machinery for \$650,000 which it installed in a rented factory. It is depreciating the machinery over 12 years by the straight-line method to a residual value of \$50,000. Late in 2007, because of increasing competition in the industry, the company believes that its asset may be impaired and will have a remaining useful life of five years, over which it estimates the asset will produce total cash inflows of \$1,000,000 and will incur total cash outflows of \$825,000. The cash flows are independent of the company's other activities and will occur evenly each year. The company is not able to determine the fair value based on a current selling price of the machinery. The company's discount rate is 10%.

#### Required

1. Prepare schedules to determine whether, at the end of 2007, the machinery is impaired and, if so, the impairment loss to be recognized.
2. If the machinery is impaired, prepare the journal entry to record the impairment.

**E11-12 Depreciation for Financial Statements and Income Tax Purposes** The Dinkle Company purchased equipment for \$50,000. The equipment has an estimated residual value of \$5,000 and an expected useful life of 10 years. The company uses straight-line depreciation for its financial statements.

#### Required

What is the difference between the company's income before taxes reported on its financial statements and the taxable income reported on its tax return in each of the first two years of the asset's life if the asset was purchased on January 2, 2007 and its MACRS life is five years?

**E11-13 Changes and Corrections of Depreciation** The Bailand Company purchased a building for \$210,000 that had an estimated residual value of \$10,000 and an estimated service life of 10 years. The company purchased the building four years ago, and has used straight-line depreciation. At the beginning of the fifth year (before it records depreciation for the year), the following *independent* situations occur:

1. The company estimates that the asset has 8 years' life remaining (for a total of 12 years).
2. The company changes to the sum-of-the-years'-digits method
3. The company discovers that the estimated residual value has been ignored in the computation of the depreciation.

#### Required

For each of the independent situations, prepare all the journal entries relating to the building for the fifth year. Ignore income taxes.

**E11-14 Depletion** The Feller Company purchased a site for a limestone quarry for \$100,000 on January 2, 2007. It estimates that the quarry will yield 400,000 tons of limestone. It estimates that its retirement obligation has a fair value of \$20,000, after which the land could be sold for \$10,000. In 2007, 80,000 tons were quarried and 60,000 tons sold. Costs of production (excluding depletion) are \$4 per ton.

#### Required

1. Compute the depletion cost per ton.
2. Compute the total cost of the inventory at December 31, 2007.
3. Compute the total cost of goods sold for 2007.

**E11-15 AICPA Adapted Depletion** The Lorton Company acquired land containing coal. Lorton will restore the land to a condition suitable for recreational use after it has extracted the coal. Geological surveys estimate that the recoverable reserves will be 4,000,000 tons and that the land will have a value of \$1 million after restoration. Relevant cost information follows:

Land	\$12,000,000
Estimated fair value of retirement obligation	1,200,000

**Required**

If Lorton maintains no inventories of coal, what is the depletion expense per ton of coal?

## PROBLEMS

**P11-1 Depreciation Methods** The Winsey Company purchased equipment on January 2, 2007 for \$700,000. The equipment has the following characteristics:

Estimated service life	20 years	Estimated residual value	\$50,000
	100,000 hours		
	950,000 units of output		

During 2007 and 2008, the company used the machine for 4,500 and 5,500 hours, respectively, and produced 40,000 and 60,000 units, respectively.

**Required** 

Compute the depreciation for 2007 and 2008 under each of the following methods:

1. Straight-line
2. Hours worked
3. Units of output
4. Sum-of-the-years'-digits
5. Double-declining-balance
6. 150%-declining-balance
7. Compute the company's return on assets (net income divided by average total assets, as discussed in Chapter 6) for each method for 2007 and 2008, assuming that income before depreciation is \$100,000. For simplicity, use ending assets, and ignore interest, income taxes, and other assets.

**P11-2 Depreciation Methods** The Lord Company purchased a machine on January 2, 2007 for \$70,000. The machine had an expected residual value of \$10,000, an expected life of eight years or 24,000 hours, and a capacity to produce 100,000 units. During 2007, the company produced 12,000 units in 2,500 hours. In 2008, the company produced 15,000 units in 3,000 hours.

**Required** 

Prepare a schedule showing the depreciation for 2007 and 2008 and the book value of the asset at the end of 2007 and 2008 for each of the following methods:

1. Straight-line
2. Hours worked
3. Units of output

**P11-3 Depreciation Methods** The Sayers Company purchased a building for \$250,000 on January 2, 2007. The building has an expected residual value of \$20,000 at the end of its expected life of 20 years.

**Required**

Prepare a schedule showing the depreciation for 2007 and 2008 and the book value on December 31, 2007 and December 31, 2008 for each of the following methods:

1. Straight-line
2. Sum-of-the-years'-digits
3. Double-declining-balance

4. 150%-declining-balance
5. Compute the company's return on assets (net income divided by average total assets, as discussed in Chapter 6) for each method in 2007 and 2008 assuming that income before depreciation is \$50,000. For simplicity, use ending assets, and ignore interest, income taxes, and other assets. Why does the rate of return increase each year?

**P11-4 Fixed Percentage of Declining Balance** The Tubbs Company purchased a machine for \$8,000 that has an estimated residual value of \$1,000 and a life of three years.

**Required**

1. Compute the depreciation rate under the fixed-percentage-of-the-declining-balance method.
2. Compute the depreciation for each year of the asset's life.

**P11-5 Changing Depreciation** The Kam Company purchased a machine on January 2, 2007 for \$20,000. The machine had an expected life of eight years and a residual value of \$300. The double-declining-balance method of depreciation is used.

**Required**

1. Compute the depreciation for each year of the asset's life.
2. Assuming that the company has a policy of always changing to the straight-line method at the midpoint of the asset's life, compute the depreciation for each year of the asset's life.
3. Assuming that the company always changes to the straight-line method at the beginning of the year when the annual straight-line amount exceeds the double-declining-balance amount, compute the depreciation for each year of the asset's life.

**P11-6 Cost of Asset and Depreciation Method** The Heist Company purchased a machine on January 2, 2007 and uses the 150%-declining-balance depreciation method. The machine has an expected life of 10 years and an expected residual value of \$5,000. The following costs relate to the acquisition and use of the machine during the first year of its operations:

Invoice price	\$50,000	Testing	\$1,100
Discounts available and taken	1,000	Normal spoilage of materials during the year	750
Freight	700	Abnormal spoilage of materials during the year	250
Installation	900	Wages of machine operator	15,000

**Required**

Compute the depreciation expense for 2007 and 2008.

**P11-7 Depreciation and Partial Periods** The following assets are owned by the Dinnell Company:

	Asset		
	A	B	C
Year purchased	2005	2006	2007
Cost	\$20,000	\$40,000	\$100,000
Expected life	5 years	8 years	10 years
Residual value	\$2,000	—	\$10,000
Depreciation method	Straight-line	Sum-of-the-years'-digits	Double-declining-balance

In the year of acquisition and retirement of an asset, the company records depreciation for one-half year. During 2008, asset A was sold for \$7,000.

**Required**

Prepare the journal entries to record depreciation on each asset for 2005 through 2008 and the sale of asset A.

**P11-8 Group and Composite Depreciation** The Cheadle Company purchased a fleet of 20 delivery trucks for \$8,000 each on January 2, 2007. It decided to use composite depreciation on a straight-line basis, and calculated the depreciation from the following schedule:

Year	Number of Trucks to Be Retired at Year-End	Estimated Residual Value per Truck
2008	2	\$4,000
2009	6	4,000
2010	8	2,000
2011	4	—

The company actually retired the trucks according to the following schedule (assume each truck was retired at the beginning of the year):

Year	Number of Trucks Retired	Total Proceeds from Retirements
2008	1	\$ 4,000
2009	3	11,000
2010	6	19,000
2011	5	6,000
2012	3	4,000
2013	2	1,000

#### Required

1. Prepare the journal entries necessary to record the preceding events.
2. Assume that the company expected all the trucks to last four years and be retired for \$1,600 each. Using group depreciation, prepare journal entries for all six years, assuming the company retired the trucks as shown by the latter schedule.

**P11-9 Composite Depreciation** The Borrell Company purchased four delivery trucks on January 2, 2007 for \$22,000 each. The company expected two of the trucks to last five years and have a residual value of \$3,500 each. The other two trucks had an expected life of eight years and no residual value. The company uses straight-line depreciation on a composite basis.

#### Required

Prepare journal entries to record the following events:

1. January 1, 2009. One of the two trucks expected to last five years is destroyed in an accident. The truck was not insured and the scrap value is \$400.
2. January 5, 2009. A new truck is acquired for \$26,000. It has an expected life of four years and a residual value of \$3,920.
3. Depreciation expense for 2009.

**P11-10 Asset Impairment** On January 1, 2002, the Borstad Company purchased a factory for \$180,000 and machinery for \$1 million. It is depreciating the factory over 30 years and the machinery over 20 years, both by the straight-line method to zero residual values. Late in 2007, because of technological changes in the industry and reduced selling prices for its products, the company believes that its asset(s) may be impaired and will have a remaining useful life of eight years. The cash flows from the factory and machinery are not separable, and are independent of the company's other activities. The company estimates that the asset will produce cash inflows of \$400,000 and will incur cash outflows of \$295,000 each year for the next 8 years. It is not able to determine the fair value of the asset based on a current selling price of the factory and machinery. The company's discount rate is 12%.

#### Required

1. Prepare schedules to determine whether, at the end of 2007, the machinery is impaired and, if so, the impairment loss to be recognized.
2. Prepare the journal entry to record the impairment.
3. How would your answer to Requirement 1 change if the discount rate was 16% and the cash flows were expected to continue for 6 years?
4. How would your answer change if management planned to implement efficiencies that would save \$10,000 each year?

**P11-11 Depreciation for Financial Statements and Income Tax Purposes** The Hunter Company purchased a light truck on January 2, 2007 for \$18,000. The truck, which will be used for deliveries, has the following characteristics:

Estimated life: 5 years

Estimated residual value: \$3,000

Depreciation for financial statements: straight-line

Depreciation for income tax purposes: MACRS (three-year-life)

From 2007 through 2011, each year, the company had sales of \$100,000, cost of goods sold of \$60,000, and operating expenses (excluding depreciation) of \$15,000. The truck was disposed of on December 31, 2011 for \$2,000.

#### Required

1. Prepare an income statement for financial reporting through pretax accounting income for each of the five years, 2007 through 2011.
2. Prepare, instead, an income statement for income tax purposes through taxable income for each of the five years, 2007 through 2011.
3. Compare the total income for all five years under Requirement 1 and Requirement 2.

**P11-12 Depletion** On January 2, 2007, the Whistler Company purchased land for \$450,000, from which it is estimated that 400,000 tons of ore could be extracted. It estimates that it will cost \$80,000 to restore the land, after which it could be sold for \$30,000.

During 2007, the company mined 80,000 tons and sold 50,000 tons. During 2008, the company mined 100,000 tons and sold 120,000 tons. At the beginning of 2009, the company spent an additional \$100,000, which increased the reserves by 60,000 tons. In 2009, the company mined 140,000 tons and sold 130,000 tons. The company uses a FIFO cost flow assumption.

#### Required

1. Calculate the depletion included in the income statement and ending inventory for 2007, 2008, and 2009.
2. Prepare the natural resources section of the balance sheet on December 31, 2007, 2008, and 2009, assuming that an accumulated depletion account is used.

**P11-13 Depletion** On July 1, 2007, the Amplex Company purchased a coal mine for \$2 million. The estimated capacity of the mine was 800,000 tons. During 2007, the company mines 10,000 tons of coal per month and sells 9,000 tons per month. The selling price is \$30 per ton and production costs (excluding depletion and depreciation) are \$8 per ton. At the end of the mine's life, it is expected that it will cost \$300,000 to restore the land, after which it can be sold for \$100,000. The company also purchased some temporary housing for the miners at a cost of \$170,000. The housing has an expected life of 10 years but is expected to be sold for \$10,000 at the end of the mine's life. The company uses the FIFO cost flow assumption.

#### Required

1. Compute the company's expenses included on the 2007 income statement.
2. Compute the cost of the company's inventory at December 31, 2007.
3. In January 2008 a new estimate indicated that the capacity of the mine was only 500,000 tons at that time. Compute the company's expenses included on the 2008 income statement if the company mines and sells 10,000 tons per month.

**P11-14 Changes and Corrections of Depreciation** During 2007, the controller of the Ryel Company asked you to prepare correcting journal entries for the following three situations:

1. Machine A was purchased for \$50,000 on January 1, 2002. Straight-line depreciation has been recorded for five years, and the Accumulated Depreciation account has a balance of \$25,000. The estimated residual value remains at \$5,000, but the service life is now estimated to be one year longer than estimated originally.
2. Machine B was purchased for \$40,000 on January 1, 2005. It had an estimated residual value of \$5,000 and an estimated service life of 10 years. It has been depreciated under the double-declining-balance method for two years. Now, at the beginning of the third year, Ryel has decided to change to the straight-line method.
3. Machine C was purchased for \$20,000 on January 1, 2006. Double-declining-balance depreciation has been recorded for one year. The estimated residual value of the machine is \$2,000 and the estimated service life is five years. The computation of the depreciation erroneously included the estimated residual value.

#### Required

Prepare any necessary correcting journal entries for each situation. Also prepare the journal entry necessary for each situation to record the depreciation for 2007. (Assume that the debit is to Depreciation Expense.)

**P11-15 AICPA Adapted Adjusting Entries** You are engaged in the examination of the financial statements of the Madle Corporation for the year ended December 31, 2007. The schedules for the property, plant, and equipment and the related accumulated depreciation accounts that follow have been prepared by the client. You have checked the opening balances to your prior year's audit workpapers. Your examination reveals the following information:

1. All equipment is depreciated on the straight-line basis (no salvage value taken into consideration) using the following estimated lives: buildings 25 years, all other items 10 years. The company's policy is to take one-half year's depreciation on all asset acquisitions and disposals during the year.
2. The company completed the construction of a wing on the plant building on June 30. The useful life of the building was not extended by this addition. The lowest construction bid received was \$17,500, the amount recorded in the Buildings account. Company personnel were used to construct the addition at a cost of \$16,000 (materials \$7,500, labor \$5,500, and overhead \$3,000).
3. On August 18, \$5,000 was paid for paving and fencing a portion of land owned by the company and used as a parking lot for employees. The expenditure was capitalized to the Land account.
4. The amount shown in the Machinery and Equipment asset retirement column represents cash received on September 4 upon disposal of a machine purchased four years ago in July for \$48,000. The bookkeeper recorded depreciation expense of \$3,500 on this machine in 2007.
5. Sydney City donated land and building appraised at \$10,000 and \$40,000, respectively, to the Madle Corporation for a plant. On September 1, the company began operating the plant. Because no costs were involved, the bookkeeper made no entry to record the transaction.

**MADLE CORP.**  
**Analysis of Property, Plant, and Equipment, and of**  
**Related Accumulated Depreciation Accounts**  
**Year Ended December 31, 2007**

Description	Final 12/31/06	Additions	Retirements	Per Books 12/31/07
Assets:				
Land	\$ 22,500	\$ 5,000	—	\$ 27,500
Buildings	120,000	17,500	—	137,500
Machinery and Equipment	385,000	40,400	\$26,000	399,400
	<u>\$527,500</u>	<u>\$62,900</u>	<u>\$26,000</u>	<u>\$564,400</u>
Accumulated Depreciation:				
Buildings	\$ 60,000	\$ 5,150*		\$ 65,150
Machinery and Equipment	173,250	39,220*		212,470
	<u>\$233,250</u>	<u>\$44,370</u>		<u>\$277,620</u>

\*Depreciation expenses for the year

### Required

Prepare the formal journal entries that you would suggest at December 31, 2007 to adjust the accounts for the transactions noted previously. Disregard income tax implications. The books have not been closed. Computations should be rounded off to the nearest dollar.

**P11-16 Comprehensive** On December 31, 2007, the Vail Company owned the following assets:

Asset	Date of Purchase	Cost	Accumulated Depreciation	Life in Years	Residual Value
Building	1/1/2005	\$50,000	\$ 3,750 <sup>a</sup>	40	\$ 0
Office machinery	1/1/2005	20,000	9,760 <sup>b</sup>	10	2,000
Office fixtures	1/1/2005	30,000	20,000 <sup>c</sup>	5	5,000

a. Straight-line depreciation

b. Double-declining-balance depreciation

c. Sum-of-the-years'-digits depreciation

The company computes depreciation and amortization expense to the nearest whole year. During 2008, the company engaged in the following transactions:

- Jan. 3 Extended the building at a cost of \$30,000. The extension provided an addition to the service potential of the building.
- Mar. 7 Sold a piece of office machinery that had originally cost \$4,000 and that had accumulated depreciation of \$1,952 on December 31, 2007. The machine was sold for \$3,000.
- Apr. 28 Obtained a patent on an invention by paying \$7,000. The company expected that the patent would provide protection against competition for 10 years.
- May 16 Purchased office fixtures and office machinery for \$9,200. The supplier reduced the price because of the joint purchase. If purchased separately, the office fixtures would have cost \$6,000 and the office machinery \$4,000. Delivery costs paid by Vail were \$200. The machinery was accidentally damaged during installation and cost \$230 to repair. The office fixtures have an estimated life of five years and a residual value of \$250. The office machinery has an estimated life of 10 years and a residual value of \$500.
- Aug. 10 Exchanged the president's desk (classified as office fixtures) for a larger desk belonging to a friend of the president. The desk had cost \$600 and had accumulated depreciation on December 31, 2007 of \$400 and an estimated residual value of \$100. The new desk had a value of \$900 and \$700 cash was paid.
- Oct. 20 Serviced and adjusted the office machinery at a cost of \$125.

### Required

1. Check the accuracy of the accumulated depreciation balances at December 31, 2007. (Round to the nearest whole dollar in all requirements.)
2. Prepare journal entries to record the preceding events in 2008, as well as the year-end recording of depreciation expense.
3. Prepare an Accumulated Depreciation account for each category of assets, enter the beginning balance, post the journal entries from Requirement 2, and compute the ending balance.

**P11-17 AICPA Adapted Comprehensive** On January 2, 2007, Brock Corporation purchased a tract of land (site number 101) with a building for \$600,000. Additionally, Brock paid a real estate broker's commission of \$36,000, legal fees

of \$6,000, and title guarantee insurance of \$18,000. The closing statement indicated that the land value was \$500,000 and the building value was \$100,000. Shortly after acquisition, the building was razed at a cost of \$75,000.

Brock entered into a \$3,000,000 fixed-price contract with Barnett Builders, Inc. on March 2, 2007 for the construction of an office building on land site number 101. The building was completed and occupied on September 30, 2008. Additional construction costs were incurred as follows:

Plans, specifications, and blueprints	\$12,000
Architects' fees for design and supervision	95,000

The company estimates that the building will have a 40-year life from date of completion and decides to use the 150%-declining-balance depreciation method.

To finance the construction cost, Brock borrowed \$3,000,000 on March 2, 2007. The loan is payable in 10 annual installments of \$300,000 plus interest at the rate of 14%. Brock's average amounts of accumulated building construction expenditures were as follows:

For the period March 2 to December 31, 2007	\$ 900,000
For the period January 1 to September 30, 2008	2,300,000

### Required

1. Prepare a schedule that discloses the individual costs making up the balance in the Land account with respect to land site number 101 as of September 30, 2008.
2. Prepare a schedule that discloses the individual costs that the company should capitalize in the Office Building account as of September 30, 2008. Show supporting computations in good form.
3. Prepare a schedule showing the depreciation expense computation of the office building for the year ended December 31, 2008.

**P11-18 AICPA Adapted Comprehensive** Logan Corporation, a manufacturer of steel products, began operations on October 1, 2006. The accounting department of Logan has started the fixed asset and depreciation schedule shown as follows:

Assets	Acquisition Date	Cost	Salvage	Depreciation Method	Estimated Life in Years	Depreciation Expense	
						Year Ended September 30 2007	2008
Land A	October 1, 2006	(1) ___	N/A*	N/A	N/A	N/A	N/A
Building A	October 1, 2006	(2) ___	\$47,500	Straight line	(3) ___	\$14,000	(4) ___
Land B	October 3, 2006	(5) ___	N/A	N/A	N/A	N/A	N/A
Building B	Under construction	\$210,000 to date	—	Straight line	30	—	(6) ___
Donated equipment	October 3, 2006	(7) ___	2,000	150% declining balance	10	(8) ___	(9) ___
Machinery A	October 3, 2006	(10) ___	5,500	Sum of the years' digits	10	(11) ___	(12) ___
Machinery B	October 1, 2007	(13) ___	—	Straight line	15	—	(14) ___

\* "N/A" means "not applicable"

You have been asked to assist in completing this schedule. In addition to ascertaining that the data already on the schedule are correct, you have obtained the following information from the company's records and personnel:

1. Depreciation is computed from the first of the month of acquisition to the first of the month of disposition.
2. Land A and building A were acquired from a predecessor corporation. Logan paid \$812,500 for the land and building together. At the time of acquisition, the land had an appraised value of \$72,000 and the building had an appraised value of \$828,000.
3. Land B was acquired on October 3, 2006 in exchange for 3,000 newly issued shares of Logan's common stock. At the date of acquisition, the stock had a par value of \$5 per share and a fair value of \$25 per share. During October 2006, Logan paid \$10,400 to demolish an existing building on this land so that it could construct a new building.
4. Construction of building B on the newly acquired land began on October 2, 2007. By September 30, 2008 Logan had paid \$210,000 of the estimated total construction costs of \$300,000. Estimated completion and occupancy are July 2009.
5. Certain equipment was donated to the corporation by a local university. An independent appraisal of the equipment when donated placed the fair value at \$16,000 and the salvage at \$2,000.

- Machinery A's total cost of \$110,000 includes installation expense of \$550 and normal repairs and maintenance of \$11,000. Salvage value is estimated at \$5,500. Machinery A was sold on February 1, 2008.
- On October 1, 2007, machinery B was acquired with a down payment of \$4,000 and the remaining payments to be made in ten annual installments of \$4,000 each beginning October 1, 2008. The prevailing interest rate was 10%. The data that follow were abstracted from present value tables:

Present Value of \$1.00 at 10%		Present Value of Annuity of \$1.00 in Arrears at 10%	
10 years	0.386	10 years	6.145
11 years	0.350	11 years	6.495
15 years	0.239	15 years	7.606

### Required

For each numbered item in the schedule, supply the correct amount next to the corresponding number. Round each answer to the nearest dollar. Show supporting computations in good form.

**P11-19 Errors** Soon after December 31, 2007 the auditor requested a depreciation schedule for trucks of the Jarrett Trucking Company, showing the additions, retirements, depreciation, and other data affecting the income of the company in the four-year period 2004 to 2007, inclusive. The following data were in the truck account as of January 1, 2004:

Truck no. 1	Purchased January 1, 2001	\$12,000
Truck no. 2	Purchased July 1, 2001	10,400
Truck no. 3	Purchased January 1, 2003	12,800
Truck no. 4	Purchased July 1, 2003	<u>15,000</u>
Balance January 1, 2004		<u>\$50,200</u>

The Accumulated Depreciation—Trucks account, previously adjusted to January 1, 2004 and duly entered in the ledger, had a balance on that date of \$16,460. This amount represented the straight-line depreciation on the four trucks from the respective dates of purchase, based on a five-year life and no residual value. No debits had been made to this account prior to January 1, 2004.

Transactions between January 1, 2004 and December 31, 2007 and their record in the ledger were as follows:

- July 1, 2004: Truck no. 1 was sold for \$1,000 cash. The entry was a debit to Cash and a credit to Trucks, \$1,000.
- January 1, 2005: Truck no. 3 was traded for a larger one (no. 5) with a five-year life. The agreed purchase price was \$12,000. The Jarrett Company paid the other company \$1,780 cash on the transaction. The entry was a debit to Trucks, \$1,780, and a credit to Cash, \$1,780.
- July 1, 2006: Truck no. 4 was damaged in a wreck to such an extent that it was sold as junk for \$50 cash. Jarrett Company received \$950 from the insurance company. The entry made by the bookkeeper was a debit to Cash, \$1,000, and credits to Miscellaneous Revenue, \$50, and Trucks, \$950.
- July 1, 2006: A new truck (no. 6) was acquired for \$20,000 cash and debited at that amount to the Trucks account. The truck has a five-year life.

Entries for depreciation had been made at the close of each year as follows: 2004, \$8,840; 2005, \$5,436; 2006, \$4,896; 2007, \$4,356.

### Required

- For each of the four years, calculate separately the increase or decrease in earnings arising from the company's errors in determining or entering depreciation or in recording transactions affecting trucks.
- Prove your work by one compound journal entry as of December 31, 2007; the adjustment of the Trucks account is to reflect the correct balances, assuming that the books have not been closed for 2007.

**P11-20 AICPA Adapted Comprehensive** Information for Blake Corporation's property, plant, and equipment for 2007 is:

Account Balances at January 1, 2007		
	Debit	Credit
Land	\$ 150,000	
Building	1,200,000	
Accumulated depreciation		\$263,100
Machinery and equipment	900,000	
Accumulated depreciation		250,000
Automotive equipment	115,000	
Accumulated depreciation		84,600

### Depreciation Method and Useful Life

Building: 150%-declining-balance; 25 years.

Machinery and equipment: Straight-line; 10 years.

Automotive equipment: Sum-of-the-years'-digits; 4 years.

Leasehold improvements: Straight-line.

The residual value of the depreciable assets is immaterial.

Depreciation is computed to the nearest month.

Transactions during 2007 and other information were as follows:

- On January 2, 2007, Blake purchased a new car for \$10,000 cash and a trade-in of a two-year-old car with a cost of \$9,000 and a book value of \$2,700. The new car has a cash price of \$12,000; the market value of the trade-in is not known.
- On April 1, 2007, a machine purchased for \$23,000 on April 1, 2002 was destroyed by fire. Blake recovered \$15,500 from its insurance company.
- On May 1, 2007, costs of \$168,000 were incurred to improve leased office premises. The leasehold improvements have a useful life of eight years. The related lease, which terminates on December 31, 2013, is renewable for an additional six-year term. The decision to renew will be made in 2013 based on office space needs at that time.
- On July 1, 2007, machinery and equipment were purchased at a total invoice cost of \$280,000; additional costs of \$5,000 for freight and \$25,000 for installation were incurred.
- Blake determined that the automotive equipment comprising the \$115,000 balance at January 1, 2007 would have been depreciated at a total amount of \$18,000 for the year ended December 31, 2007.

#### Required

- For each asset classification, prepare schedules showing depreciation and amortization expense, and accumulated depreciation and amortization that would appear on Blake's income statement for the year ended December 31, 2007 and on the balance sheet at December 31, 2007, respectively.
- Prepare a schedule showing the gain or loss from disposal of assets that would appear in Blake's income statement for the year ended December 31, 2007.
- Prepare the property, plant, and equipment section of Blake's December 31, 2007 balance sheet.

**P11-21 AICPA Adapted Comprehensive** The Plant Asset and Accumulated Depreciation accounts of Pell Corporation had the following balances at December 31, 2006:

	Plant Asset	Accumulated Depreciation
Land	\$ 350,000	\$ —
Land improvements	180,000	45,000
Building	1,500,000	350,000
Machinery and equipment	1,158,000	405,000
Automobiles	150,000	112,000

Depreciation method and useful lives:

- Land improvements: Straight-line; 15 years.
- Building: 150%-declining-balance; 20 years.
- Machinery and equipment: Straight-line; 10 years.
- Automobiles: 150%-declining-balance; 3 years.
- Depreciation is computed to the nearest month. No salvage values are recognized.

Transactions during 2007:

- On January 2, 2007, machinery and equipment were purchased at a total invoice cost of \$260,000, which included a \$5,500 charge for freight. Installation costs of \$27,000 were incurred.
- On March 31, 2007, a machine purchased for \$58,000 on January 3, 2003 was sold for \$36,500.
- On May 1, 2007, expenditures of \$50,000 were made to repave parking lots at Pell's plant location. The work was necessitated by damage caused by severe winter weather.
- On November 2, 2007, Pell acquired a tract of land with an existing building in exchange for 10,000 shares of Pell's \$20 par common stock, which had a market price of \$38 a share on this date. Pell paid legal fees and title insurance totaling \$23,000. The last property tax bill indicated assessed values of \$240,000 for land and \$60,000 for building. Shortly after acquisition, the building was razed at a cost of \$35,000 in anticipation of new building construction in 2008.
- On December 31, 2007, Pell purchased a new automobile for \$15,250 cash and trade-in of an automobile purchased for \$18,000 on January 1, 2006. The new automobile has a cash value of \$19,000.

**Required**

1. Prepare a schedule analyzing the changes in each of the plant assets during 2007, with detailed supporting computations. Disregard the related accumulated depreciation accounts.
2. For each asset classification, prepare a schedule showing depreciation expense for the year ended December 31, 2007.
3. Prepare a schedule showing the gain or loss from each asset disposal that Pell would recognize in its income statement for the year ended December 31, 2007.

**P11-22 Comprehensive** The Lurch Company's December 31, 2006 balance sheet follows:

Assets		
Cash		\$ 540,000
Inventory		450,000
Prepaid rent		60,000
Machine	\$500,000	
Less: Accumulated depreciation	(135,000)	365,000
		<u>\$1,415,000</u>
Liabilities and Equities		
Accounts payable		\$ 400,000
Common stock, \$10 par		300,000
Additional paid-in capital		515,000
Retained earnings		200,000
		<u>\$1,415,000</u>

During 2007, the following transactions occurred:

1. To avoid paying monthly rent of \$5,000 on existing plant facilities, the company decided to buy a tract of land and construct a building of its own on it. On January 2, 2007, Lurch exchanged 6,000 shares of its common stock to acquire the land; the stock was selling for \$25 per share. Construction of the building also began on January 2, 2007. At the time, Lurch borrowed funds by issuing a one-year, \$500,000 note at 12% to help finance the project. The principal and interest on the note are due January 3, 2008. Construction costs (paid in cash) that occurred evenly throughout the year totaled \$700,000. The building was completed on December 30, 2007 and the move-in to the new building was to occur during the next week.
2. On January 2, 2007 Lurch exchanged its one existing machine plus \$50,000 for a newer machine with a fair value of \$430,000. The new machine is to be depreciated using straight-line depreciation based on an economic life of five years and a residual value of \$55,000.
3. Lurch uses a FIFO perpetual inventory system. Lurch sold \$350,000 of its inventory for \$700,000 cash, paid for its beginning accounts payable, and purchased \$480,000 of inventory on account during the year.
4. On July 31, 2007, Lurch declared and paid a \$2.50 per share cash dividend to its shareholders.
5. Lurch is subject to a 30% income tax rate, and income taxes are accrued at year-end.

**Required**

Prepare Lurch's income statement and statement of retained earnings for the fiscal year ended December 31, 2007 and a balance sheet as of December 31, 2007. Show all supporting journal entries and computations made during 2007. (*Contributed by Scott I. Jerris*)

## CASES

### COMMUNICATION

#### C11-1 Depreciation

**AICPA Adapted** The certified public accountant is frequently called upon by management for advice regarding methods of computing depreciation. Although the question arises less frequently, of comparable importance is whether the depreciation method should be based on the consideration of the assets as units, as a group, or as having a composite life.

**Required**

1. Briefly describe the depreciation methods based on treating assets as:
  - a. Units
  - b. A group or as having a composite life
2. Explain the arguments for and against the use of each of the two methods.
3. Explain how retirements are recorded under each of the two methods.

### C11-2 Capitalization and Depreciation

**AICPA Adapted** Gehl Company purchased significant amounts of new equipment this year to be used in its operations. The equipment was delivered by the suppliers, installed by Gehl, and placed into operation. Gehl purchased some for cash with discounts available for prompt payments. It purchased some under long-term payment plans, for which the interest charges approximate prevailing rates. As a result, Gehl is studying its capitalization and depreciation policies.

#### Required

1. What costs should Gehl capitalize for the new equipment purchased this year?
2. What factors cause the equipment to lose its future economic benefit?
3. What factors should be considered in computing the equipment's depreciation expense?
4. What theoretical justifications are there for the use of accelerated depreciation methods?

### C11-3 Capitalization and Depreciation

**AICPA Adapted** At the beginning of the year, Patrick Company acquired a computer to be used in its operations. The computer was delivered by the supplier, installed by Patrick, and placed into operation. The estimated useful life of the computer is five years, and its estimated residual (salvage) value is significant.

During the year, Patrick received cash in exchange for an automobile that was purchased in a prior year.

#### Required

1. a. What costs should Patrick capitalize for the computer?  
b. Explain the objective of depreciation accounting. (Do not discuss specific methods of depreciation.)
2. Explain the rationale for using accelerated depreciation methods.
3. How should Patrick account for and report the disposal of the automobile?

### C11-4 Straight-Line and Composite Depreciation

**AICPA Adapted** Portland Co. uses the straight-line depreciation method for depreciable assets. All assets are depreciated individually, except manufacturing machinery, which is depreciated by the composite method.

During the year, Portland exchanged a delivery truck with Maine Co. for a larger delivery truck. It paid cash equal to 10% of the larger truck's value.

#### Required

1. Explain the factors that should influence Portland's selection of the straight-line depreciation method.
2. Explain how Portland should account for and report the truck exchange transaction.
3. a. What benefits should Portland derive from using the composite method rather than the individual basis for manufacturing machinery?  
b. How should Portland calculate the manufacturing machinery's annual depreciation expense in its first year of operation?

### C11-5 Operating and Capital Expenditures

**AICPA Adapted** Property, plant, and equipment (plant assets) generally represent a material portion of the total assets of most companies. Accounting for the acquisition and usage of such assets is, therefore, an important part of the financial reporting process.

#### Required

1. Distinguish between operating (revenue) and capital expenditures and explain why this distinction is important.
2. Briefly define depreciation as used in accounting.
3. Identify the factors that are relevant in determining the annual depreciation and explain whether these factors are determined objectively or whether they are based on judgment.
4. Explain why depreciation is usually shown in the net cash flow from operating activities section of the statement of cash flows.

## CREATIVE AND CRITICAL THINKING

### C11-6 Depreciation Concepts

**AICPA Adapted** Depreciation continues to be one of the most controversial, difficult, and important problem areas in accounting.

#### Required

1. a. Explain the conventional accounting concept of depreciation accounting, and  
b. Discuss its conceptual merit with respect to (1) the value of the asset, (2) the amount(s) expensed, and (3) the discretion of management in selecting the method.
2. a. Explain the factors that should be considered when applying the conventional concept of depreciation to the determination of how the value of a newly acquired computer system should be assigned to

expense for financial reporting purposes. (Ignore income tax considerations for this case.)

- b. What depreciation methods might be used for the computer system?

### C11-7 Depreciation Concepts

Prepare a short report that evaluates each of the following statements separately:

1. "Since our plant was shut down for part of the year, we will not depreciate it. Depreciating it for the full year would increase our costs and overstate the inventory."
2. "I think we should have increasing depreciation each period because it will increase the funds recovered near the end of the asset's life when maintenance costs are high and we will need to replace the asset. Also, I think tax rates will be higher toward the end of

the asset's life, so we will be better off to have larger depreciation then."

### C11-8 Depreciation

**AICPA Adapted** May Manufacturing Company was organized January 2, 2007. During 2007, it has used in its reports to management the straight-line method of depreciating its plant assets.

On November 9, you are having a conference with May's officers to discuss the depreciation method to be used for income tax and stockholder reporting. The president of May has suggested the use of a new method, which he feels is more suitable than the straight-line method for the needs of the company during the period of rapid expansion of production and capacity that he foresees. The following is a schedule in which the proposed method is applied to a fixed asset with an original cost of \$32,000, an estimated useful life of five years, and a scrap value of approximately \$2,000.

Year	Years of Life Used	Fraction Rate	Depreciation Expense	Accumulated Depreciation, Year-End	Book Value at Year-End
1	1	1/15	\$ 2,000	\$ 2,000	\$30,000
2	2	2/15	4,000	6,000	26,000
3	3	3/15	6,000	12,000	20,000
4	4	4/15	8,000	20,000	12,000
5	5	5/15	10,000	30,000	2,000

The president favors the new method because he has heard that:

1. It will increase the funds recovered during the years near the end of the asset's useful life when maintenance and replacement disbursements are high.
2. It will result in increased write-offs in later years, thereby reducing taxes.

#### Required

1. Explain the purpose and, hence, the nature of accounting for depreciation.
2. Is the president's proposal within the scope of generally accepted accounting principles? In making your decision, explain the circumstances, if any, under which the method would be reasonable and those, if any, under which it would not be reasonable.
3. The president wants your advice.
  - a. Explain whether depreciation recovers or creates funds.
  - b. Assume that the Internal Revenue Service accepts the proposed depreciation method in this particular case. If the proposed method were used for stockholder and tax reporting purposes, explain how it would affect the availability of funds generated by operations.

### C11-9 Asset Writedowns

NBC paid \$401 million for the rights to televise the 1992 Summer Olympic Games, and it was widely reported that it had a loss of more than \$60 million. CBS purchased the rights to the 1992 and 1994 Winter Olympic Games for a combined \$543 million. CBS reported a \$322 million pretax loss on its baseball and football contracts in 1991.

#### Required

1. Under what conditions, if any, should NBC and CBS have written-down the value of their assets?
2. Does this situation allow opportunities for earnings management?

### C11-10 Analyzing Coca-Cola's Property, Plant, and Equipment Disclosures

Refer to the financial statements and related notes of the Coca-Cola Company in Appendix A of this book.

#### Required

1. Which depreciation method does the company use? Why do you think the company selected this method?
2. Compute the estimated average age of the property, plant, and equipment.
3. Assuming the company estimates a residual value of 10% of the cost, compute the estimated average life of the property, plant, and equipment.
4. Recreate summary journal entries to record the transactions and events that affected property, plant, and equipment during 2004.

### C11-11 Ethics and Depreciation Issues

You are auditing the financial records of a company and are reviewing the depreciation computations. Included in the assets are two buildings and numerous machines in each building. One of the buildings is used to manufacture components of toys and the other for assembly and packing, using the manufactured components as well as others purchased from suppliers. You see that the company uses straight-line depreciation over 40 years for the buildings and 20 years for the machinery. You decide to ask the CFO about these calculations, and he replies, "We use 40 years for the buildings because it is close to the 39 we use for tax. And our best guess is that we will replace the machines twice while we use the building. And the method is easy to use and most companies use it, don't they? Or have things changed that much since I was in college?" You feel as if you have annoyed the CFO with your questions, so you decide to leave. As you walk back to your office, you recall from earlier in the audit that the company uses FIFO and LIFO for different segments of its inventory and that all top-level managers receive bonuses based on reported income.

#### Required

From financial reporting and ethical perspectives, what depreciation methods and lives would you recommend?

## RESEARCH SIMULATIONS

### R11-1 Researching GAAP

#### Situation

The Magic Movie Company has been formed to produce films for showing in movie theaters. The president knows that there are some unusual accounting issues regarding asset valuation and income recognition and has asked for your advice.

#### Directions

1. Research the related generally accepted accounting principles and prepare a short memo to the president. Cite your references and applicable paragraph numbers.
2. Does this situation allow opportunities for earnings management?

### R11-2 Researching GAAP

#### Situation

Scientific Software sells software to the oil industry. Its policy is to recognize revenue when it signs a licensing agreement for the software. It uses a 13-year amortization period for the software products it capitalizes. The president has asked you to evaluate these revenue recognition and amortization policies.

#### Directions

1. Research the related generally accepted accounting principles and prepare a short memo to the president. Cite your references and applicable paragraph numbers.
2. Why do you think the company might have selected a 13-year amortization period? (*Adapted from The Wall Street Journal, 11/6/90*)

## OBJECTIVES

After reading this chapter, you will be able to:

- 1 Explain the accounting alternatives for intangibles.
- 2 Understand the amortization or impairment of intangibles.
- 3 Identify research and development costs.
- 4 Explain the conceptual issues for research and development costs.
- 5 Account for identifiable intangible assets including patents, copyrights, franchises, computer software costs, and trademarks and tradenames.
- 6 Account for unidentifiable intangibles including internally developed and purchased goodwill.
- 7 Understand the disclosure of intangibles.
- 8 Explain the conceptual issues regarding intangibles.

## Intangibles

### Managing Intangibles Can Lead to Large Profits

With the move to a more knowledge-based economy over the last three decades, intangible assets are replacing tangible assets as the key value driver for the economy. A recent study by Accenture estimates that, on average, 60% of a company's value is tied to intangible assets. Of the executives surveyed, 49% indicated that their company primarily relies on intangible assets to create shareholder wealth; however, only 5% of executives indicated that their company had an effective system for measuring the performance of intangible assets.

Given the high degree of uncertainty in valuing the future benefits from intangibles, it is easy to see why management may often become frustrated with tracking intangible assets. Consider the recent events affecting **Merck & Co.** In September 2004, Merck withdrew its arthritis medicine, Vioxx, from the market because of a link between the medicine and increased risk of heart problems. As a result, its stock plunged more than 26%. In January 2005, Merck's stock fell 10% after a federal appeals court effectively nullified a patent and granted a competitor the right to market a version of Merck's second-biggest selling drug. Finally, Merck will soon lose patent protection on its top-selling product, the cholesterol-lowering drug Zocor.

Credit: Associated Press, AP

While companies like Merck may have experienced negative financial effects related to intangible assets, other companies have effectively defended the value of their intangible assets. For example, **Intergraph Corp.** reported that it has received approximately \$860 million in 2003 and 2004 relating to the protection and enforcement of its intellectual property. Trying to measure, track, and analyze intangible assets is a difficult task. However, if companies can effectively manage their intangibles, they should be able to enhance company performance and increase shareholder value.

## FOR FURTHER INVESTIGATION

For a discussion of intangible assets, consult the Business & Company Resource Center (BCRC):

- Developing an Effective Strategy for Managing Intellectual Assets. John Tao, Joseph Daniele, Edward Hummel, David Goldheim, Gene Slowinski, *Research-Technology Management*, 0895-6308, Jan–Feb 2005, v48, i1, p50–58.
